1. Reviewing and setting aside the following decisions:

1.1. The decision taken by the first respondent on 17 April 2023 ("the first decision") to grant an environmental authorisation in terms of regulation 24 of the Environmental Impact Assessment Regulations 2014 (GN R. 982 of 4 December 2014), read with section 24 of the National Environmental Management Act 107 of 1998 ("NEMA"), to the third respondent for Proposed 3D Seismic Survey activities off the West Coast of South Africa.

1.2. The decision taken by the second respondent on 22 May 2024 in terms of section 43(6) of NEMA to dismiss the appeals by the applicants against the first decision and to confirm and amend the environmental authorisation for the proposed activities ("the second decision").

2. Substituting the first decision and the second decision with an order refusing the environmental authorisation;

3. That the costs of this application be paid by the first and second respondent, alternatively by the first, second and third respondent jointly and severally, in the event of the third respondent opposing such relief;

4. Granting the Applicants such further and/or alternative relief as this Honourable Court deems fit.

TAKE NOTICE FURTHER that in terms of Rule 53(1)(b) the first respondent and the second respondent are required within 15 (fifteen) days of receipt of the notice of motion to dispatch to the Registrar of this Honourable Court the record of the proceedings sought to be reviewed and set aside, together with such reasons as they are required by law or desire to give, and to notify the applicants that it has done so;

TAKE NOTICE FURTHER that the applicants may, within 10 (ten) days of receipt of the record from the Registrar, by delivery of a notice and accompanying affidavit or affidavits, amend, add to or vary the terms of their notice of motion and supplement their founding papers in terms of Rule 53(4).

TAKE NOTICE FURTHER that any opposing respondent may, within 30 (thirty) days after the expiry of the time referred to in Rule 53(4), deliver any affidavits it may desire in answer to the allegations made by the Applicants.

TAKE NOTICE FURTHER that the Applicants have appointed **Chennells Albertyn** of 44 Alexander Street, Stellenbosch and care of 18A Greenwich Road, Rondebosch, Cape Town as the address at which it will accept notice and service of all process in these proceedings.

TAKE NOTICE FURTHER that such respondents as are intent on opposing the relief set out above: may within 15 (fifteen) days of receipt of the notice of motion notify the Applicants' attorneys in writing that they intend to oppose the application and in such notice to appoint an address referred to in Rule 6(5)(b) at which it/they will accept notice and service of all documents in these proceedings; and within 30 (thirty) days' of such date deliver any affidavits they may desire in answer to the allegations made by the Applicants.

BE PLEASED TO TAKE NOTICE FURTHER that the affidavits of **Johannes Walter Steenkamp, Michele E H Fournet, Gillian Kay Hamilton, Mark New, Jean Mary Harris**, and the confirmatory affidavits of **Carmelita Mosterd, John Adams, Jacqueline Sunde** and **Chief Regan James** and will be used in support hereof.

TAKE NOTICE FURTHER that if any of the respondents intend opposing the relief sought in this notice of motion, they are required:

(i) To notify the applicants' attorney in writing within five (5) days of service of this application; and

(ii) Within 15 (fifteen) days after they have so given notice of their intention to oppose the application, to file their answering affidavits, if any.

If no such notice of intention be given, the application will be made on a date to be allocated by the Registrar of the above Honourable Court at 10h00.

DATED AT CAPE TOWN THIS 13th DAY OF NOVEMBER 2024.

OFFICE OF THE CHIEF JUSTICE
2024 -11- 14
WESTERN CAPE HIGH COURT

FOUNDING AFFIDAVIT

I, the undersigned,

JOHANNES WALTER STEENKAMP

do hereby make oath and say:

SWS

1. I am an adult small-scale fisherman and the Chairperson of the AUKOTOWA FISHERIES PRIMARY CO-OPERATIVE LIMITED ("Aukotowa"), Registration Number: 2018/005127/24) with registered address at DAFF Building, Beach Road, Port Nolloth, 8280 and doing business from Joos Engelbrecht Street, Port Nolloth, 8280. I am duly authorised to bring this application and to depose to this founding affidavit on behalf of the applicant. A resolution to this effect is attached to this affidavit marked "A1.1".

2. The facts contained in this affidavit are within my personal knowledge unless it appears otherwise and are, to the best of my belief, true and correct.

3. I attach confirmatory affidavits deposed to by Priyanka Naidoo, on behalf of the second applicant, and Delme Cupido, on behalf of the third applicant confirming the content of my affidavit as "A1.2" and "A1.3".

4. Where I make legal submissions in this affidavit, I do so on the advice of my legal representatives, whose advice I believe to be correct.

INTRODUCTION

5. Aukotowa is a co-operative of 64 small-scale fishers, established in 2018. All of our members are generational fishers residing in Port Nolloth, a coastal town in the Northen Cape.

JWS

6. Port Nolloth, like many small towns in South Africa, is stricken by poverty. The town started as a railway junction for the copper-mining industry, along with off-shore diamond mining. However, traditional fishing has always existed in the area.

7. Our heritage of fishing is a definitive part of our culture and the culture of this region. Despite the long association between the local community and fishing to sustain our communities, I do not remember a time when we were able to partake in this activity free of exclusionary regulation or environmental encroachments from successive governments and multi-national mining companies.

8. Under apartheid, fishing quotas were available only to white people. This changed after the transition to democracy, however, it was almost impossible to obtain fishing rights as a person without means. Subsequently, most of the fishing rights were available only to commercial fishers and people who could afford to pay the application fees.

9. We were eventually able to obtain some recognition of traditional fishing rights following the adoption of the "Policy for the Small-Scale Fisheries Sector in South Africa" in Feburary 2012 This was the product of decades of activism and a long, litigious struggle with the Government.

10. The background to the policy is described in its introduction as follows:

"This policy aims to provide redress and recognition to the rights of Small Scale fisher communities in South Africa previously marginalised and discriminated against in terms of racially exclusionary laws and policies, individualised permit-based systems of resource allocation and insensitive impositions of conservation-driven regulation."

11. This policy took many years to develop and resulted in amendments to the Marine Living Resources Act, 18 of 1998 in 2014. Despite the progressive policy and official legal recognition of small-scale fishing rights, this has not stopped the steady marginalisation of West Coast fishers by commercial fishing and the development of other industries along our coastline.

12. Each of our 64 members now depends on their catch as their livelihood. Because of this, we have a deep appreciation for the ocean as a source of life.

13. In recent years we have seen a decline in our fish stocks and changes in their migration patterns. We need to go further out to sea in our small roeiboete (row boats) which is a safety risk for us. We believe that these changes are due to climate change. We have seen the behaviour of large marine mammals such as whales become more aggressive. There has also been a change in the fishing seasons and migration of fish. When I fished with my father almost 36 years ago, we would return home with a huge catch, today this is rare.

14. The fishers of the West Coast have always travelled extensively up and down the coast to 'chase the fish' and enable our livelihoods, which provides food

JLS

security for our communities. In general, we travel between 20-30 kilometres offshore to catch snoek during the season which usually runs from March-September. Due to changes in the climate and ocean, which we have seen as fishers, sometimes the season is longer and can stretch from the end of February to December.

15. I relay these facts as the background to our interest in this case. Aukotowa is extremely concerned about the degradation of the oceans and our local coastline, which is at the heart of so much of our history and culture and is also now the source of our livelihoods.

THE APPLICATION

16. This is an application to:

16.1 review and set aside the confirmation on appeal on 22 May 2024 ("the Appeal Decision") by the second respondent in terms of section 43(6) of the National Environmental Management Act 107 of 1998 ("NEMA") of an environmental authorisation ("the EA") granted on by the first respondent, as the competent authority in terms of section 24O of NEMA, to the third respondent 17 April 2023 in terms of section 24 of NEMA allowing for a 3D seismic survey off the West Coast of South Africa ("the Project") in the area of jurisdiction of the Local Municipality in the Western Cape Province, and the Local Municipality in the Northern Cape Province, in the area

described in the EA ("the Project area");

16.2 review and set aside the first respondent's decision to grant the EA;

16.3 substitute the first and second respondent's decisions with an order refusing the environmental authorisation; and

16.4 further relief as set out in the Notice of Motion which will be filed with this affidavit.

17. When dealing generally with both decisions, I will refer to them as "the decisions". I will refer to the DG and the Minister collectively as "the decision-makers".

18. This founding affidavit is structured as follows:

18.1. In Part A, I describe the parties to the application.

18.2. In Part B, I outline the applicant's involvement with the Project.

18.3. In Part C, I describe the authorised activities and the relief sought in this application.

18.4. In Part D, I set out the relevant factual background.

18.5. In Part E, I set out relevant statutory and regulatory provisions.

18.6. In Part F, I discuss the review grounds in light of the relevant facts and the legislative provisions; and

18.7. In Part G, I summarise the applicant's grounds of review.

19. The following is a list of acronyms used in this affidavit:

BAR	basic assessment report
CA	competent authority
CO_2	carbon dioxide
CO_2eq	carbon dioxide equivalent
dB	decibels
EA	environmental authorisation
EAP	environmental assessment practitioner
EIA	environment impact assessment
EMPr	environmental management programme
GHGs	Greenhouse gases
HIA	heritage impact assessment
IAP	interested and affected party
ICMA	National Environmental Management: Integrated Coastal Management Act 24 of 2008
IEA	International Energy Agency
IISD	International Institute for Sustainable Development
IRENA	International Renewable Energy Agency

JLS

IPCC	Intergovernmental Panel on Climate Change
LEDS	Low Emissions Development Strategy 2050
Mt	Megatons
MMO	Marine Mammal Observers
µPa	micropascals
NDC	nationally determined contribution
NEMA	National Environmental Management Act 107 of 1998
NEMPAA	National Environmental Management: Protected Areas Act 57 of 2003
PAJA	Promotion of Administrative Justice Act 3 of 2000
PAM	Passive Acoustic Monitoring
PASA	Petroleum Agency of South Africa
SCC	species of conservation concern
SEA	strategic environmental assessment
SIA	social impact assessment
Tcf	trillion cubic feet
TTS	Temporary Threshold Shifts
UNFCC	United Nations Framework Convention on Climate Change
UPRDA	Upstream Petroleum Resources and Development Bill, 2021

20. In all the quotations in this affidavit in which underlining or emphasis appears, it is my emphasis unless I specify otherwise.

PART A: THE PARTIES

JC JS

21. **The first applicant is the AUKOTOWA FISHERIES PRIMARY CO-OPERATIVE LIMITED, a company duly incorporated in accordance with the company laws of South Africa with registration number 2018/005127/24 and having its principal place of business at DAFF Building, Beach Road, Port Nolloth, 8280.**

22. The second applicant is THE GREEN CONNECTION NPC, a non-profit company incorporated in terms of the laws of South Africa with registration no. 2021/773490/08 and having its registered address at Unit B1 Clareview Business Park, 236 Imam Haron Road, Claremont, Cape Town ("Green Connection").

23. The third applicant is NATURAL JUSTICE, a voluntary association established with the object of providing legal support to indigenous and local communities. Natural Justice is a duly registered Nonprofit Organisation in terms of the laws of South Africa under registration no. 057-611-NPO and having its principal place of business at 6th Floor, Mercantile Buildings, 63 Hout Street, Cape Town ("Natural Justice").

24. **The Green Connection and Natural Justice are both organisations whose object is to promote sustainable development by empowering people to participate in decision-making about their environment.**

25. The first respondent is the DIRECTOR-GENERAL: DEPARTMENT OF MINERAL AND PETROLEUM RESOURCES ("the DG" and "the Department") with an address at Environmental House, Corner of Steve Biko and Soutpansberg Street, Arcadia, Pretoria. This application will be served on the

JCB

DG's physical address and on the State Attorney, Pretoria, at 316 Thabo Sehume Street, Pretoria Central, Pretoria, 0001, and the State Attorney, Cape Town, at Floor 4, Liberty Life Centre, 22 Long Street, Cape Town, 8001.

26. The second respondent is the MINISTER OF FORESTRY, FISHERIES, AND THE ENVIRONMENT ("the Minister") in his official capacity. This application will be served on the Minister at Environmental House, corner Steve Biko and Soutpansberg Street, Arcadia, Pretoria, and care of the State Attorney, Pretoria, 316 Thabo Sehume Street, Pretoria Central, Pretoria, 0001, and the State Attorney, Cape Town, at Floor 4, Liberty Life Centre, 22 Long Street, Cape Town, 8001.

27. The third respondent is TGS Geophysical Company (UK) Ltd ("TGS"), a corporation registered in terms of the corporate laws of the United Kingdom, registration number , whose main place of business is at Dukes Court Street, Woking, GU21 5BH, United Kingdom with its South African place of business at 8 Dalmeny Road, Pine Park, Randburg, Gauteng Province.

28. The fourth respondent is the MINISTER OF MINERAL AND PETROLEUM RESOURCES with an address at Trevenna Campus, Building 2C, C/o Meintjes & Francis Baard Street, PRETORIA, and at 120 Plein Street, Floor 7, CAPE TOWN. This application will be served on the fourth respondent's physical address and care of the State Attorney, Pretoria, 316 Thabo Sehume Street, Pretoria Central, Pretoria, 0001, and the State Attorney, Cape Town, at Floor 4, Liberty Life Centre, 22 Long Street, Cape Town, 8001.

PART B: THE APPLICANTS' INVOLVEMENT WITH THE PROJECT

29. The EA granted to TGS, which lies at the core of these proceedings, is a prerequisite for the exercise of rights pertaining to any reconnaissance permit granted to TGS in terms of section 75 of the Mineral and Petroleum Resources Development Act No. 28 of 2002 ("the MPRDA").

30. According to TGS it has applied for a reconnaissance permit and its application has been received by the Department, but I do not know whether a permit has been granted.

31. The applicants bring this application (i) in the interest of, or on behalf of, the members of the first applicant, and of persons who, for practical reasons, are unable to institute such proceedings, including members of coastal communities who do not have the capacity or resources to do so; (ii) in the interests of coastal communities who are affected by the proposed seismic activities; (iii) in the public interest with regard to both present and future generations; and (iv) in the interest of protecting the environment, to further the objectives of section 24 of the Constitution of the Republic of South Africa, 1996 ("the Constitution") in terms of section 38 of the Constitution and section 32 of NEMA.

32. The applicants registered as interested and affected parties ("IAPs") and commented on the application for the EA underlying the Project when it was

EWS

advertised for public participation during 2022, and were among four other appellants, who appealed against the EA in May 2023. All the appeals were dismissed.

PART C: THE AUTHORISED ACTIVITIES AND THE RELIEF SOUGHT IN THIS APPLICATION

33. The relief sought in this application is for judicial review in terms of the Promotion of Administrative Justice Act 3 of 2000 ('PAJA'), alternatively, the principle of legality, and the setting aside of the EA and the appeal decision.

34. The Project area for the proposed 3D seismic survey is approximately 57 400 km² in extent, located between approximately 120 km offshore of St Helena Bay, extending north along the western coastline to approximately 230 km offshore of Hondeklip Bay. A single survey vessel equipped with seismic sources and streamers is to be used for the seismic survey, supported by two escort vessels. It is estimated that the 3D survey will take up to 70 days (including downtime) during the approved operating window between January and May, and is currently due to start in 2025 provided TSG receives its reconnaissance permit in time.

35. The Project area is adjacent to the Namaqualand and West Coast District Municipalities, the City of Cape Town metropolitan municipality, and the following local municipalities: Cederberg Local Municipality, Saldanha Bay

BWS

Local Municipality, Bergrivier Local Municipality, Swartland Local Municipality, Nama Khoi Local Municipality, Kamiesberg Local Municipality, Ritchersveld Local Municipality and Matzikama Local Municipality.

36. The authorised activities of the Project relate to the seismic survey and are set out in the EA granted in respect thereof, which is attached marked "A2". The technical details of the Project are described on pages 7 and 8 of the EA.

37. The Minister's decision dismissing the applicant's appeal against the grant of the EA is attached marked "A3". The EA was confirmed and a further condition added by the Minister: "I am including a new condition in the EA, requiring the Applicant to appoint a community / fisheries liaison officer, who must be available to the affected communities. The communities must have access to the liaison officer who, in turn, must keep them informed of the activities at regular intervals and be available to answer any questions that they may have." (Para 2.22.10.)

38. The bases for the relief sought by the applicant are the following:

38.1. The basis of the first ground of review is that the BAR omitted relevant information and considerations in respect of impacts on marine life, particularly from underwater acoustic impacts and cumulative impacts, and that the decisions of the DG and the Minister were not rationally connected to the information before them, were irrational and/or

unreasonable, and failed to give adequate consideration to the precautionary principle.

38.2. The basis of the second ground of review is that the public participation process followed by the EAP in the EIA process did not ensure that persons in vulnerable and disadvantaged communities were given sufficient opportunity to develop the understanding, skills and capacity necessary for achieving equitable and effective participation, or ensure that community well-being and empowerment was adequately promoted through environmental education, the raising of environmental awareness, the sharing of knowledge and experience and other appropriate means.

38.3. The basis of the third ground of review is that the Minister failed to consider the reduced need for the seismic survey due to part of the Project area already having been surveyed, and the BAR failed to conduct a rational assessment of need and desirability in that the BAR:

38.3.1. considered only the potential positive impacts of the production of oil and gas for the purposes of determining need and desirability and not the potential negative impacts thereof, which was inconsistent and irrational;

38.3.2. failed to conduct a proper assessment of the option of not implementing the activity; and;

38.3.3. failed to conduct an assessment of the potential social, economic and environmental impacts of the exploration and production of oil and gas.

38.4 The basis of the fourth ground of review is that conditions of authorisation in the EA required the submission of further plans by the developer to the competent authority for approval without any public participation in regard thereto.

38.5 The basis of the fifth ground of review is that the BAR failed, with respect to the ICMA, to determine the policy and legislative context within which the proposed activity is located and how the activity complies with and responds to the policy and legislative context, or to contain the information that is necessary for the competent authority to consider and come to a decision on the application.

38.6 The basis of the sixth ground of review is that the EMPr is materially deficient and fails adequately to set out the impacts and risks that need to be avoided, managed and mitigated, or to provide an identification of the manner in which the impact management outcomes will be achieved, the method of monitoring the implementation of the impact management actions, and the mechanism for monitoring compliance with the impact management actions.

5025

38.7 The basis of the seventh ground of review is that the EA failed to contain a plan which locates the proposed activity or activities authorised at an appropriate scale.

38.8 The basis of the eighth ground of review is that the BAR failed adequately to assess the cumulative impacts and risks of seismic blasting.

PART D: THE RELEVANT FACTUAL BACKGROUND

39. In this part I address the relevant factual background, under the following headings:

D.1: Seismic blasting

D.2 The Basic Assessment Report

D.3 The Social Impact of the Project

D.4 A History of Marginalisation and Discrimination

D.1 Seismic Blasting

40. The ocean is an acoustic world. This is because water is a dense medium, and sound travels faster and farther underwater. Marine species have evolved to depend on sound for essential biological functions, including feeding, breeding, communicating, navigating, and socialising. Sound is therefore also a fundamental component of marine habitats. The full impacts of seismic blasting

on marine life are not known. However, what is known is that airguns produce some of the loudest known underwater sounds on the planet, and in some cases, can be detected 4,000 kilometres from the source. These impacts are described in the expert report of Dr. Michelle Fournet, an acoustic ecologist at the University of New Hampshire. Dr Fournet specialises in the interactions between marine organisms and human activities, and her report will be filed together with this affidavit.

41. The BAR and associated specialist reports in this matter explain that during seismic surveys, high-level, low frequency sound pulses are generated by an acoustic instrument towed behind a survey vessel, 5 to 25 metres below the sea surface. The sounds are directed towards the seabed and the seismic signal is reflected by the geological interfaces below the seafloor. The reflected signals are received by an array of receivers or sets of hydrophones towed behind the vessel in a single streamer (2D) or in multiple streamers (3D) and are fed back to the recording instruments on board. The expert report of Dr. Fournet describes the process in detail. The survey will utilize a single 100 metre seismic ship equipped with seismic sources and streamers, supported by up to two escort vessels of unknown size, and is expected to last around 70 days. The towed hydrophone streamers would be 8,000 meters in length and 2,000 meters, approximately 87 football fields long and 30 football fields wide. The seismic pulse would be discharged every 2-6 seconds continuously during exploration operations at source levels (loudness at the source) between 200-255 dB re 1 µPa; for reference this is among the loudest produced anthropogenic sounds on the planet and is in the range of military weapons or

explosions.

42. According to Dr. Fournet and the BAR and its associated specialist reports, it is well established that marine seismic surveys can cause serious and irreparable harms to marine life extending well beyond the project site, ranging from death to long-term and debilitating behavioural impacts. For example, Dr. Fournet explains that anthropogenic noise within critical biodiversity areas ("CBAs") and marine protected areas ("MPAs") may harm, alter, or lead to death or population decline across a wide range of organisms and life stages that make up both ends of the trophic web (food web). Because noise cannot be contained to the project site, the impacts of noise are farther reaching than the directing region of interest and must include coastal and adjacent pelagic areas as well. The Marine specialist study and the Background Assessment Report ("BAR") which it supported acknowledge a wide range of impacts on numerous species:

42.1. physiological injury and/or mortality;

42.2. behavioural avoidance;

42.3. reduced reproductive success/spawning;

42.4. masking of environmental sounds and communication;

42.5. collision of turtles/marine mammals with the survey and support vessels or entanglement in towed acoustic apparatus; and

42.6. indirect impacts on piscivorous predators due to seismic effects on prey species.

43. According to the Marine study, the following species are present in the Project area and face the highest risk of harm from the proposed survey:

43.1. humpback whales, which migrate through the area between June and November (inclusive);

43.2. sperm whales, beaked whales and other odontocetes that frequent offshore waters;

43.3. large migratory pelagic fish and shark species that show seasonal association with Child's Bank and Tripp Seamount;

43.4. leatherback turtles which frequent offshore waters in low numbers and aggregate around seamounts to feed on jellyfish; and

43.5. various pelagic Albatross, Petrel, Storm Petrel and Shearwater species (the Pisces report indicates that pelagic seabirds are likely to be relatively frequently encountered in the offshore waters of the Reconnaissance Permit area).

D.2 The Basic Assessment Report

44. On 22 September 2022, TGS applied to the Department in terms of section 24 of NEMA for the EA by following environment impact assessment ("EIA") process and submitting a BAR.

45. Public participation was invited by advertising and making available a Draft BAR on the website of the environment assessment practitioner ("EAP"), Environment Impact Management Services (Pty) Ltd, who was appointed to submit the application and the BAR. IAPs and the public were notified of the availability of the Draft BAR on 24 October 2022, and were invited to submit their comments by 25 November 2022. Thereafter, the EAP finalised the BAR (referred to hereafter as "the BAR" or "the Final BAR") and submitted it to the Department for approval on 6 December 2022.

46. I attach, marked "A4" a copy of the Final BAR. There were six appendices thereto, which I shall list, but I shall only attach the parts thereof that appear to be relevant:

46.1. Appendix 1: the CV of the EAP (not attached).

46.2. Appendix 2: Public Participation, which has thirteen appendices thereto:

46.2.0. Appendix 1. IAP Database (not attached).

JCS

46.2.1. Appendix 2, Advertisements (not attached).

46.2.2. Appendix 3, Initial Notification(not attached).

46.2.3. Appendix 4, Site Notice proof (not attached).

46.2.4. Appendix 5, Radio Advertisements (not attached).

46.2.5. Appendix 6, Initial Public Meeting Minutes, a copy of which is attached marked "A5.1".

46.2.6. Appendix 7, Public Meeting Reminder Notice (not attached).

46.2.7. Appendix 8, Draft BAR notification (not attached).

46.2.8. Appendix 9, Draft BAR Review Public Meeting Documentation, a copy of which is attached marked "A5.2".

46.2.9. Appendix 10, Draft BAR Review Reminder Notifications (not attached).

46.2.10. Appendix 11, Data-free SMS Notification (not attached).

46.2.11. Appendix 12, Table of Correspondence (not attached).

46.2.12. Appendix 13, Correspondence Document, portions of which will be attached below, which I shall describe, marked A6.1 to A6.2.

46.3. Appendix 3, Specialist Reports, of which there were five:

46.3.1. Appendix 3.1, a Marine Ecological Assessment, by Pisces Environmental Services (Pty) Ltd, dated September 2022, a copy of which I attach marked "A7.1". I refer to this as "the Marine Study".

46.3.2. Appendix 3.2, a Fisheries Assessment, by CapMarine (Pty) Ltd, dated September 2022, a copy of which I attach marked "A7.2".

46.3.3. Appendix 3.3, a Heritage Impact Assessment ("HIA"), by PGS Heritage (Pty) Ltd dated 28 September 2022, a copy of which is attached marked "A7.3", and a Heritage Declaration, a copy of which is attached marked "A7.3.1". I shall refer to this as "the HIA".

46.3.4. Appendix 3.4, a Social Impact Assessment ("SIA"), by Equiperspectives Research & Consulting Services (Pty) Ltd, dated September 2022, a copy of which I attach marked "A7.4". I refer to this as "the SIA".

46.3.5. Appendix 3.5, Acoustic Technical Report, by SLR Consulting, Australia (Pty) Ltd dated 10 October 2022, a copy of which is attached marked "A7.5", which I refer to as "the Acoustic study", and two Acoustics Declarations, copies of which are attached marked "A7.5.1" and "A7.5.2" respectively.

46.4. Appendix 4, an Impact Assessment Matrix, a copy of which is attached marked "A8".

46.5. Appendix 5, an Environmental Management Programme by the EAP, dated 6 October 2022, a copy of which is attached marked "A9". I refer to this as "the EMPr".

46.6. Appendix 6, a Rehabilitation and Closure Plan by the EAP, dated 6 October 2022 (not attached).

47. The applicants duly appealed against the EA to the Minister. A copy of the first applicant's appeal is attached marked A10, and a copy of the second and third applicants' appeal is in the appeal table together with TGS' responses thereto attached marked A.11, with five annexures to their appeal marked A11.1 to A11.5.

D.3 The Social Impacts of the Project

JCOS

48. The Social Impact Assessment ("SIA") (Annexure A7.4, referred to above) includes the following statements in its executive summary:

> *"Seismic reconnaissance projects are controversial in South Africa and have been in the news frequently in the last year. For many stakeholders it is an emotional matter, for others the potential of impacting their livelihoods is the biggest fear"*

> *"From a social perspective it is clear that the communities and majority of local people are opposed to the project."*

> *"If the social risks and potential damage to cultural and indigenous rights are considered the impact on the social fabric of already vulnerable communities may be significant. At this stage communities feel that they cannot make informed decisions."*

49. The following social risks were identified in the SIA: uncertainty; further marginalisation of vulnerable groups; concerns about cumulative impacts; perceived impact on livelihoods; impacts on sense and spirit of place; impacts on the social licence to operate; stakeholder fatigue and disillusionment; community expectations; and social unrest. These led to various recommendations, which I discuss further below.

50. The SIA finds that TGS lacks a social license to operate, which it defines as

"...the acceptance and belief by society, and specifically local communities, in the value creation of activities". The SIA states, with reference to the judgement in Sustaining the Wild Coast NPC and Others v Minister of Mineral Resources and Energy and Others 2022 (6) SA 589 (ECMk) ("Sustaining the Wild Coast"):

> *"Given the media attention surrounding the Shell ruling in September 2022 and the court interdict against Searcher in March 2022* [both related to seismic blasting] *there is a general mistrust against any company that want* (sic) *to conduct seismic surveys. Communities demand meaningful consultation, which go beyond the requirements of an EIA process. They want to feel that they can make informed decisions and have sufficient time to digest the technical information. Community members expressed misgivings about the government and its abillty to protect their interest. They feel that the decision to support the application has already been made."* (SIA table 6 on page 82.)

51. The decisions in this matter were taken in the context of a climate crisis. In August 2021, the Intergovernmental Panel on Climate Change (IPCC) (an international body for assessing the science related to climate change) released its 6th Assessment Report, known as "AR6". In its summary for policymakers, the IPCC indicates (among other things) that it is unequivocal that human influence has warmed the atmosphere, ocean and land, and that widespread and rapid changes in the atmosphere, ocean, cryosphere and biosphere have occurred; human-induced climate change is already affecting many weather

and climate extremes in every region across the globe; and, from a physical science perspective, limiting human-induced global warming to a specific level requires limiting cumulative CO_2 emissions. I attach a copy of the said report marked A6.1 to 6.2. I shall elaborate further on this in the grounds of review below.

D.4 A History of Marginalisation and Discrimination

52. The HIA, Annexure A7.3, states (in para 7 on page 34): *"It must be noted that, first and foremost, a large section of the effected communities not only view them* (sic) *as small-scale fishers but also as indigenous people and, as such, are intrinsically linked to the ocean and the land they have lived on for centuries."*

53. **This accurately reflects our cultural heritage. The HIA details a history of land appropriation and forced relocation, collapse of the fishing industry, poverty, marginalisation and discrimination.**

54. The HIA includes the following in its impact statement (in para 9.1 on p 41.), highlighting the social issues in the community:

> *"The public meetings and focused discussions with interlocutors have shown that these communities and groupings are struggling economically due to decades of turmoil in the fishing industry. An*

industry plagued by the closing of fish processing plants, fishing licence and quota issues, and diminishing catches due to environmental and industrial impacts, to name a few. This economic downturn led to social issues within the communities. Foremost are poverty, loss of social fabric, substance abuse, teenage pregnancies, and violence. In all the interviews, the above issues were raised as central to their social existence and community experience."

55. The overall impacts of the Project are assessed in the BAR as being low after taking mitigating measures into account. The impacts are summarised in the impact assessment matrix in Appendix 4 to the BAR (Annexure A8), which lists 33 impacts and the results of their assessment. Fifteen impacts relate to marine ecology, six relate to fisheries, one relates to heritage, and eleven relate to social impacts.

56. Four of the social impacts were given a high impact rating before mitigation: uncertainty, concerns about cumulative impacts, further marginalisation of vulnerable groups, and impacts on social licence to operate. These were all rated as medium impact after mitigation, along with another five social impacts that remained medium after mitigation: stakeholder engagement and fatigue, perceived impact on livelihoods, impacts on sense of spirit and place, community expectations and social unrest. All the other 24 impacts were rated low after mitigation. I say more about the effectiveness of the social mitigation measures in the grounds of review below.

57. The environment impact statement in the BAR recommends authorisation of the Project. It states:

> *"The findings of the specialist studies conclude that there are no environmental fatal flaws that should prevent the proposed project from proceeding, provided that the recommended mitigation and management measures are implemented. Based on the nature and extent of the proposed project, the local level of disturbance predicted as a result of the reconnaissance activities, the findings of the specialist studies, and the understanding of the significance level of potential environmental impacts, it is the opinion of the EIA project team and the EAP that the significance levels of the majority of identified negative impacts can generally be reduced to an acceptable level by implementing the recommended mitigation measures and the project should be authorized. ..."* (BAR, Annexure A4, para 13.1 on p 248.)

58. The mitigation measures in the BAR are generally carried through to the EMPr (Annexure A9). However, in certain respects the EMPr fails to achieve its purpose of addressing the recommended mitigations. I deal with this in the seventh ground of review.

PART E: RELEVANT STATUTORY AND REGULATORY PROVISIONS

5405

59. It is necessary at this juncture to describe relevant statutory provisions and regulatory requirements underpinning the EA and the Appeal Decision.

E.1 The Constitution

60. Section 24 of the Constitution states:

> *"**Environment.**—Everyone has the right—*
>
> *a) to an environment that is not harmful to their health or well-being; and*
>
> *b) to have the environment protected, for the benefit of present and future generations, through reasonable legislative and other measures that—*
>
> *(i) prevent pollution and ecological degradation,*
>
> *(ii) promote conservation; and*
>
> *(ii) secure ecologically sustainable development and use of natural resources while promoting justifiable economic and social development."*

E.2 NEMA

61. NEMA is one of the suite of laws giving effect to section 24(b) of the Constitution and provides the framework for environmental management in South Africa.

62. Section 1 of NEMA defines sustainable development as "*the integration of*

JWS

social, economic and environmental factors into planning, implementation and decision-making so as to ensure that development serves present and future generations."

63. Section 2 of NEMA sets out binding principles. Section 2(3) provides that development must be socially, environmentally and economically sustainable, and section 2(4) includes factors relevant to sustainable development.

64. In accordance with the power in section 24(2) of NEMA whereby the Minister may identify activities that may not commence without environmental approval, the Minister has listed and published the following activity relevant to this review application:

> *"Any activity including the operation of that activity which requires a reconnaissance permit in terms of section 74 of the Mineral and Petroleum Resources Development Act, as well as any other applicable activity as contained in this Listing Notice or in Listing Notice 3 of 2014, required to exercise the reconnaissance permit, excluding-*
>
> *(i) any desktop study; and*
>
> *(ii) any aerial survey."*

65. Accordingly, a listed activity may not be commenced with unless environmental approval from the Competent Authority had been sought and obtained. In the case of mineral and petroleum activities, the Competent Authority is the Minister

responsible for mineral resources.

66. The procedure for applications for environmental authorisations is governed by the Environmental Impact Assessment Regulations, 2014 ("the EIA Regulations").

67. An application for environmental approval is made to the Competent Authority as contemplated in chapter 5 of NEMA and chapter 4 of the EIA Regulations.

68. The substantive matters to be considered by the Competent Authority involve a careful exercise of discretion.

69. NEMA and the EIA Regulations list multiple principles and factors which must be taken into account by the Competent Authority when deciding the EIA application. These include the principles of environmental management in section 2 of NEMA.

70. While section 2 of NEMA enumerates several principles of environmental management, a key principle is that environmental management is to "place people and their needs at the forefront of its concern, and serve their physical, psychological, developmental, cultural and social interest equitably" (section 2(2)).

71. When development is pursued, which serves the needs of people, it must take place in a manner that is "socially, environmentally and economically

sustainable" (section 2(3)). In other words, it must be sustainable development.

72. Section 2(4)(a) of NEMA provides that sustainable development requires the consideration of all relevant factors including, amongst others, the following:

> "*(i) that the disturbance of ecosystems and loss of biological diversity are avoided, or, where they cannot be altogether avoided, are minimised and remedied;*
>
> *(ii) that pollution and degradation of the environment are avoided, or, where they cannot be altogether avoided, are minimised and remedied;*
>
> *(iii) that the disturbance of landscapes and sites that constitute the nation's cultural heritage is avoided, or where it cannot be altogether avoided, is minimised and remedied;*
>
> ...
>
> *(v) that the use and exploitation of non-renewable natural resources is responsible and equitable, and takes into account the consequences of the depletion of the resource;*
>
> ...
>
> *(vii) that a risk-averse and cautious approach is applied, which takes into account the limits of current knowledge about the consequences of decisions and actions; and*
>
> *(viii) that negative impacts on the environment and on people's environmental rights be anticipated and prevented, and where they cannot be altogether prevented, are minimised and remedied."*

JWS

73. **Section 2(4) of NEMA includes the following:**

> *"(b) Environmental management must be integrated, acknowledging that all elements of the environment are linked and interrelated, and it must take into account the effects of decisions on all aspects of the environment and all people in the environment by pursuing the selection of the best practicable environmental option.*
>
> *(c) Environmental justice must be pursued so that adverse environmental impacts shall not be distributed in such a manner as to unfairly discriminate against any person, particularly vulnerable and disadvantaged persons.*
>
> ...
>
> *(i) The social, economic and environmental impacts of activities, including disadvantages and benefits, must be considered, assessed and evaluated, and decisions must be appropriate in the light of such consideration and assessment;*
>
> ...
>
> *(n) Global and international responsibilities relating to the environment must be discharged in the national interest.*
>
> ...
>
> *(o) The environment is held in public trust for the people, the beneficial use of environmental resources must serve the public interest and the environment must be protected as the people's common*

JWS

heritage.

...

(r) Sensitive, vulnerable, highly dynamic or stressed ecosystems, such as coastal shores, estuaries, wetlands, and similar systems require specific attention in management and planning procedures, especially where they are subject to significant human resource usage and development pressure. ..."

74. Section 23(2) of NEMA establishes the general objectives of integrated environmental management, which include that it must:

"(a) promote the integration of the principles of environmental management set out in section 2 into the making of all decisions which may have a significant effect on the environment;

(b) identify, predict and evaluate the actual and potential impact on the environment, socio-economic conditions and cultural heritage, the risks and consequences and alternatives and options for mitigation of activities, with a view to minimising negative impacts, maximising benefits, and promoting compliance with the principles of environmental management set out in section 2;

(c) ensure that the effects of activities on the environment receive adequate consideration before actions are taken in connection with them;

(d) ensure adequate and appropriate opportunity for public participation

in decisions that may affect the environment;

(e) ensure the consideration of environmental attributes in management and decision-making which may have a significant effect on the environment; and

(f) identify and employ the modes of environmental management best suited to ensuring that a particular activity is pursued in accordance with the principles of environmental management set out in section 2."

75. Section 24(1) of NEMA provides that:

"In order to give effect to the general objectives of integrated environmental management laid down in this Chapter, the potential consequences for or impacts on the environment of listed activities or specified activities must be considered, investigated, assessed and reported on to the competent authority or the Minister responsible for mineral resources, as the case may be, except in respect of those activities that may commence without having to obtain an environmental authorisation in terms of this Act."

76. Section 24(4) of NEMA elaborates on the nature of the investigation, assessment and reporting required:

"Procedures for the investigation, assessment and communication of the potential consequences or impacts of activities on the environment -

(a) must ensure, with respect to every application for an environmental authorisation - ...

(ii) that the findings and recommendations flowing from an investigation, the general objectives of integrated environmental management laid down in this Act and the principles of environmental management set out in section 2 are taken into account in any decision made by an organ of state in relation to any proposed policy, programme, process, plan or project;

(iii) that a description of the environment likely to be significantly affected by the proposed activity is contained in such application;

(iv) investigation of the potential consequences for or impacts on the environment of the activity and assessment of the significance of those potential consequences or impacts;

(v) public information and participation procedures which provide all interested and affected parties, including all organs of state in all spheres of government that may have jurisdiction over any aspect of the activity, with a reasonable opportunity to participate in those information and participation procedures; and

(b) must include, with respect to every application for an environmental authorisation and where applicable –

(i) investigation of the potential consequences or impacts of the alternatives to the activity on the environment and assessment of the significance of those potential consequences or impacts, including the option of not implementing the activity;

(ii) investigation of mitigation measures to keep adverse

consequences or impacts to a minimum;

(iii) investigation, assessment and evaluation of the impact of any proposed listed or specified activity on any national estate referred to in section 3 (2) of the National Heritage Resources Act, 1999 (Act No. 25 of 1999);

(iv) reporting on gaps in knowledge, the adequacy of predictive methods and underlying assumptions, and uncertainties encountered in compiling the required information;

(v) investigation and formulation of arrangements for the monitoring and management of consequences for or impacts on the environment, and the assessment of the effectiveness of such arrangements after their implementation; [and]

(vi) consideration of environmental attributes identified in the compilation of information and maps contemplated in subsection (3);

(vii) provision for the adherence to requirements that are prescribed in a specific environmental management Act relevant to the listed or specified activity in question."

77. It is in this context that regulation 18 of the EIA Regulations requires that the Competent Authority must have regard to the "need and desirability" of the activity, together with the considerations in sections 24O and 24(4) of NEMA when deciding upon an application for environmental approval.

78. The Department of Environmental Affairs has published a *Guideline on Need*

and Desirability ("the Need and Desirability Guideline") to guide this evaluation in applications for environmental authorisation. This is an "implementation guideline" contemplated in section 24J of NEMA and accordingly its contents were a relevant factor in the decision-making process in terms of section 24O(1)(b)(viii).

79. The Need and Desirability guideline states that, in considering the questions related to sustainable development, when deciding upon an application for environmental approval, "it must be decided which alternatives represent the 'most practicable environmental option'". NEMA defines the "best practicable environmental option" as that which "provides the most benefit and causes the least damage to the environment as a whole, at a cost acceptable to society, in the long-term as well as in the short-term."

80. Section 24N(1) provides that the Competent Authority may require the submission of an environmental management programme ("EMPr") before considering an application for an EA. Section 24N(1A) requires this for EIAs. Section 24N(2) contains a list of information which an EMPr must contain.

81. Section 24O sets out the criteria to be taken into account by competent authorities when considering applications. Section 24O(1) requires the Minister, when considering an application for an EA, to:

> *"(b) take into account all relevant factors, which may include - ...*
>
> *(i) any pollution, environmental impacts or environmental*

AWS

degradation likely to be caused if the application is approved or refused;

(ii) measures that may be taken—

(aa) to protect the environment from harm as a result of the activity which is the subject of the application; and

(bb) to prevent, control, abate or mitigate any pollution, environmental impacts or environmental degradation; ..

(i) where appropriate, any feasible and reasonable alternatives to the activity which is the subject of the application and any feasible and reasonable modifications or changes to the activity that may minimise harm to the environment;

(vi) information contained in the application form, reports, comments, representations and other documents submitted in terms of this Act to the Minister, Minister responsible for mineral resources, MEC or competent authority in connection with the application;

(viii)any guidelines, departmental policies, and environmental management instruments that have been adopted in the prescribed manner by the Minister or MEC, with the concurrence of the Minister, and any other information in the possession of the competent authority that are relevant to the application; ..."

E.3 The EIA Regulations

82. Regulation 1 of the EIA Regulations includes the following definitions:

BCS

*"**alternatives**", in relation to a proposed activity, means different means of meeting the general purpose and requirements of the activity which may include alternatives to the-*

(a) property on which or location where the activity is proposed to be undertaken;

(b) type of activity to be undertaken;

(c) design or layout of the activity;

(d) technology to be used in the activity; or

(e) operational aspects of the activity;

and includes the option of not implementing the activity.

*"**basic assessment report**" means a report contemplated in regulation 19;*

*"**cumulative impact**", in relation to an activity, means the past, current and reasonably foreseeable future impact of an activity, considered together with the impact of activities associated with that activity, that in itself may not be significant, but may become significant when added to the existing and reasonably foreseeable impacts eventuating from similar or diverse activities.*

83. Regulation 2 sets out the purpose of the EIA Regulations;

"The purpose of these Regulations is to regulate the procedure and criteria as contemplated in Chapter 5 of the Act relating to the preparation, evaluation, submission, processing and consideration of,

JCS

and decision on, applications for environmental authorisations for the commencement of activities, subjected to environmental impact assessment, in order to avoid or mitigate detrimental impacts on the environment, and to optimise positive environmental impacts, and for matters pertaining thereto."

84. Regulation 18 provides:

"Criteria to be taken into account by competent authorities when considering applications.- *When considering an application the competent authority must have regard to section 24O and 24(4) of the Act, the need for and desirability of the undertaking of the proposed activity, the requirements of these Regulations, any protocol or minimum information requirements relevant to the application as identified and gazetted by the Minister in a government notice or any relevant guideline published in terms of section 24J of the Act."*

85. Regulation 19 sets out the requirements for the submission of a BAR and supporting documents to the Competent Authority, the relevant parts of which provide:

"(3) A basic assessment report must contain the information set out in Appendix 1 to these Regulations ....

(4) An EMPr must contain the information set out in Appendix 4 to

these Regulations. . . .

(6) A specialist report must contain all information set out in Appendix 6 to these Regulations . . . ."

86. Regulation 25 provides for the issue of an EA. Regulation 26 stipulates what an EA must contain, and includes the following:

"An environmental authorisation must specify - ...

(c) a description of the location of the activity, including-

(iv) a plan which locates the proposed activity or activities authorised at an appropriate scale, or, if it is -

(aa) a linear activity, a description and coordinates of the approved corridor of the activity or activities, ...

(d) the conditions subject to which the activity may be undertaken, including conditions determining- ...

(iv) requirements for the avoidance, management, mitigation, monitoring and reporting of the impacts of the activity on the environment throughout the life of the activity additional to those contained in the approved EMPr, and where applicable the closure plan; ...

and

(i) any relevant conditions which the competent authority deems

FCOS

appropriate."

87. Regulation 40(2) provides:

> *"The public participation process contemplated in this regulation must provide access to all information that reasonably has or may have the potential to influence any decision with regard to an application unless access to that information is protected by law . ."*

88. Regulation 41(6) provides:

> *"When complying with this regulation, the person conducting the public participation process must ensure that-*
>
> *(a) information containing all relevant facts in respect of the application or proposed application is made available to potential interested and affected parties; ..."*

89. Appendix 1 to the EIA Regulations sets out the requirements of a BAR. Paragraph 1 thereof provides:

> *"The environmental outcomes, impacts and residual risks of the proposed activity must be set out in the basic assessment report."*

90. Section 2 of Appendix 1 to the EIA Regulations provides:

"The objective of the basic assessment process is to, through a consultative process -

(a) determine the policy and legislative context within which the proposed activity is located and how the activity complies with and responds to the policy and legislative context;

(b) identify the alternatives considered, including the activity, location, and technology alternatives; . .

(d) through the undertaking of an impact and risk assessment process, inclusive of cumulative impacts which focused on determining the geographical, physical, biological, social, economic, heritage, and cultural sensitivity of the sites and locations within sites and the risk of impact of the proposed activity and technology alternatives on these aspects to determine -

(i) the nature, significance, consequence, extent, duration, and probability of the impacts occurring to; and

(ii) the degree to which these impacts -

(aa) can be reversed;

(bb) may cause irreplaceable loss of resources; and

(cc) can be avoided, managed or mitigated; . . ."

91. Section 3(1) of Appendix 1 to the EIA Regulations, which sets out the required information that is necessary for the competent authority to consider and come to a decision on the application, includes: ...

"(i) a full description of the process undertaken to identify, assess and

5 of 25

rank the impacts the activity will impose on the preferred location through the life of the activity, including -

(i) a description of all environmental issues and risks that were identified during the environmental impact assessment process; and

(ii) an assessment of the significance of each issue and risk and an indication of the extent to which the issue and risk could be avoided or addressed by the adoption of mitigation measures.

(j) an assessment of each identified potentially significant impact and risk, including -

(i) cumulative impacts;

(ii) the nature, significance and consequences of the impact and risk;

(iii) the extent and duration of the impact and risk;

(iv) the probability of the impact and risk occurring;

(v) the degree to which the impact and risk can be reversed;

(vi) the degree to which the impact and risk may cause irreplaceable loss of resources; and

(vii) the degree to which the impact and risk can be avoided, managed or mitigated; ...

(m) based on the assessment, and where applicable, impact management measures from specialist reports, the recording of the proposed impact management outcomes for the development for inclusion in the EMPr; ..."

TDS

92. Appendix 6 of the EIA Regulations sets out what must be contained in specialist reports.

E.4 Listing Notices identifying listed activities in terms of NEMA

93. Three listing notices were issued along with the EIA Regulations, identifying activities in respect of which applications for EA must be submitted, the form of application, and the Competent Authority to whom it must be submitted.

94. The activity applied for in this matter is listed activity 19B in Listing Notice 1, GN 983 of 4 December 2014. Listing Notice 1 requires the basic assessment process to be followed.

PART F: THE REVIEW GROUNDS IN LIGHT OF THE RELEVANT FACTS AND LEGISLATIVE PROVISIONS

First Ground of Review – Marine Impacts

95. The first ground of review is that the BAR omitted relevant information and considerations in respect of impacts on marine life, and that the decisions of the DG and the Minister were not rationally connected to the information before them, were irrational and/or unreasonable, and failed to give adequate consideration to the precautionary principle.

96. As I have said above, the serious and irreparable harms to marine life caused by seismic surveys are well established, and these are listed in the BAR, and

numerous species are present in the Project area and face the risk of harm from the seismic survey.

97. In essence, the BAR finds that the Project area is far from the coastal area where the risk to marine life is the highest, with the result that the residual risks of the Project, after mitigation, are low.

98. In this regard the BAR relies on the Marine study, which itself relies on the modelling of the Acoustic study. Both these studies were desktop studies.

99. This ground of review is based chiefly on the gaps in knowledge and consequent fatally flawed assessments arising from a misconceived scope of the Acoustic study and flawed assumptions on which the studies are based.

100. In the circumstances, a cautious and risk-averse approach (the precautionary principle) should have been adopted, which would have resulted in the application for EA being refused, or the appeal being upheld.

Information before the decision-makers

101. Section 24O(1)(b) (vi) of NEMA requires the Competent Authority ("CA") to take into account all relevant factors, which may include, *"information contained in the application form, reports, comments, representations and other documents submitted in terms of this Act to the Minister, Minister responsible for mineral*

resources, MEC or competent authority in connection with the application".

102. The DG, who was the CA in this matter, was required to take into consideration the second and third applicants' representations regarding the Draft BAR, a copy of which is attached marked **A13.1**, including two specialist studies attached thereto related to impacts on marine life:

102.1. Annexure A, *"Report on Scientific Basis for Concerns of Significant Harm Inflicted to Marine Wildlife by 2D and 3D Seismic Surveys on the South and West Coasts of South Africa"* by Harris JM, Olbers JM, Wright K, dated 14 January 2022, a copy of which is attached marked **A13.2**, which I shall refer to as "Harris (January 2022)".

102.2. Annexure B, "*Comments on Tosaco Energy Block 1 Exploration Right issued to Tosaco Energy (Pty) Ltd (PASA Reference: 12/3/362)*" by Harris JM, Olbers JM, Wright K, dated 6 April 2022, a copy of which is attached marked **A13.3**, which I shall refer to as "Harris (April 2022)".

103. The DG's reasons for his decision made no specific reference to marine impacts, and failed to engage with the issues raised in regard thereto by the second and third applicants.

104. The DG's reasons contained only generalised statements in regard to impacts and mitigation measures, based on what he alleged were a "careful consideration of information submitted to the Department". (A2 para 3 on pg 15,

JCJS

"Key Findings".)

105. The second and third applicants' appeal included as a ground of appeal impacts on marine life (Annexure A12 hereto, paragraphs 62 to 125), and attached thereto three expert affidavits:

105.1. Annexure B1, affidavit of Aaron B Rice, PhD, dated 28 February 2022, which formed part of the court papers in the *Sustaining the Wild Coast* case, confirming the accuracy of a paper he wrote, titled *"Scientific Evaluation of the Transkei and Algoa Exploration Areas: Environmental Management Programme (EMPr) Final Report"*. (Annexure A11.1 hereto), which I shall refer to as "Rice (February 2022)".

105.2. Annexure B2, affidavit of Douglas Nowacek, which formed part of the court papers in the Sustaining the Wild Coast case in 2021, referred to above, describing how seismic airgun noise travels in the ocean and discussing harms from seismic surveys to marine mammals, based on an expert declaration he had made that was filed in a United States court and which provided the court with a summary of scientific evidence about the impacts of seismic airguns on marine life, and in particular on North Atlantic right whales. (Annexure A11.2 hereto, which I shall refer to as "Nowacek (2021)". It was deposed to on 9 December 2021, as per the signature page attached marked A11.2.1.)

105.3. Annexure B3, affidavit of Jean Mary Harris, dated 19 January 2022,

JDS

which formed part of the court papers in the case of Adams and Others v Minister of Mineral Resources and Energy and Others (1306/22) [2022] ZAWCHC 24 (1 March 2022)("the Adams case"), confirming the accuracy of her article Harris (January 2022) referred to above. (Annexure A11.3 hereto.)

106. The Minister was required to consider all the aforementioned material, which formed part of the record before her.

Unjustified attack on the credibility of the second and third applicants' experts by the EAP and TGS

107. I am astonished by the approach taken by the EAP (in response to the second and third applicant's comments on the Draft BAR) and by TGS (in its response to the second and third applicants' appeal submissions) regarding marine impacts, which amounts to an attack on the credibility of their experts without engaging meaningfully with the content thereof, but instead reiterating what is contained in the BAR. The EAP's responses are attached marked **A13.4.**

108. In response to the second and third Applicant's comments on the Draft BAR and the two expert reports attached thereto, (Harris (January 2022) and Harris (April 2022)), the EAP attacked the credibility of the reports by implying they were biased, making the following unsubstantiated claim:

"The studies undertaken internationally over the past ~70 years on the impacts of noise on marine fauna (of which some 400 peer-reviewed publications have been summarised and cited in the marine faunal specialist study) have concluded that the effects of underwater sounds vary substantially and depend on a wide variety of physical and biological factors. When writing articles on the effects of seismic acquisition on marine fauna it is therefore not difficult to bias the literature cited to either demonstrate detrimental and irreversible impacts or only very limited impacts, depending on the personal view of the author(s) and/or the targeted readership."

109. One must bear in mind that Harris, the author of both those reports, was also an author of the National Coastal and Marine Spatial Biodiversity Plan, relied on in the BAR, and was the author of two other articles cited favourably in the BAR and by the marine specialist.

110. The expert evidence of Harris was accepted by the court as credible in the Sustaining the Wild Coast case and in the Adams case.

111. In fact, Harris (January 2022) cited 88 peer reviewed studies in support of the views expressed, 38 of which are cited favourably in the Marine study. The other 50 are not cited at all in the Marine Study.

112. The Fishery Impact Assessment cited three of Harris' articles with approval.

FI 28

113. The aspersions cast upon the credibility of Harris, who is a well-renowned expert, are completely unjustified, and this undermines the credibility of the BAR.

114. The EAP also used the same response quoted above, identically worded, in responding to comments on the Draft BAR submitted by Dr Jacqueline Sunde, who has published extensively since 1990 with over 30 peer-reviewed articles dealing with Ocean Governance, marine spatial planning, women's rights and small-scale fishing. Two of her articles are cited favourably in the Fisheries Impact Assessment.

115. It appears that the EAP's response quoted above is a stock response of the EAP to considered views that differ from those in the EAP's reports.

116. Despite the second and third applicants submitting the three affidavits I have mentioned with their appeal, TGS made use of the identically worded credibility attack quoted above in its response to the second and third applicants' appeal, without engaging with the points specifically raised in the affidavit other than by referring to the BAR and reiterating what it says. TGS's response is attached marked **A13.5**, being an extract of the relevant part of the response to their appeals.

117. Neither the DG nor the Minister had anything to say about this, or the basis on which they rejected the expert opinions before them.

118. Dr Rice (February 2022) cites 98 peer reviewed articles, and the record and experience of Dr Rice speaks for itself. Many of those articles are cited in the Pisces report as well.

119. The expert evidence of Dr Rice was accepted by the court as credible in the Sustaining the Wild Coast case and in the Adams case.

120. Likewise, the record and experience of Professor Nowacek in Nowacek (2021) speaks for itself, and the credibility of his evidence was also accepted in the Sustaining the Wild Coast case, where the court described him as "the Repass-Rodgers Chair of Marine Conservation Technology in the Nicolas School of the Environment and the Edmund T Pratt School of Engineering at Duke University in Durham, North Carolina, United States of America".

121. In his affidavit Nowacek refers to a more detailed declaration he made that was filed in a United States court that was attached to his affidavit in the Adams case, and in its judgment, the court did not question his credibility.

122. As I shall show, the rejection of the expert views of the second and third applicants' was irrational.

Critical Gaps in information related to the Acoustic and Marine Studies

123. In her affidavit Dr Fournet expresses her opinion on the BAR, the Marine study

FL28

and the Acoustics study attached to the BAR.

124. Dr Fournet identifies several pertinent gaps in information and deficiencies in the assessment of marine impacts in the BAR, which she describes in some detail in her report. I attach hereto, as Annexure A14, Dr Fournet's report.

125. Most of the issues Dr Fournet raises were previously raised in the EIA process by the second and third applicants in their comments on the Draft BAR and appeal and in the expert reports attached thereto. The appeal, for example, raised a plethora of issues under the following headings:

125.1. Acoustic Modelling

125.2. Heightened Legislative Requirements are Not Considered for Critical Biodiversity Areas (CBAs), Ecologically or Biologically Significant Marine Areas (EBSAs), and Marine Protected Areas (MPAs)

125.3. Cape fur seals.

125.4. Whales and dolphins.

125.5. Fish.

125.6. Zooplankton.

125.7. The proposed mitigation measures are inadequate to prevent unacceptable harm to marine life.

125.8. Lack of baseline noise assessment.

126. I preface my summary of Dr Fournet's opinion by pointing out that the learned author expresses the following opinion:

> *"The Acoustics Specialist Report and the associated Marine Ecology Report solicited by TGS fail to adequately demonstrate that anthropogenic noise generated by the proposed seismic campaign will not have significant ecological consequences for marine organisms and habitats at the permit location."*

I pause to point out that this is an appropriate application of the precautionary principle.

127. This failure, says Fournet, is primarily due to the following five factors:

127.1 the failure to recognize the anthropogenic noise from the project as chronic;

127.2 the failure to consider the full spatial extent of the noise generated by the project,

127.3 the omission of an assessment of underwater ambient sound conditions at the site prior to the proposed activities;

127.4 the failure to evaluate potential impacts on the broader marine community, including population-level effects; and

127.5 the failure to incorporate the most up-to-date and relevant scientific recommendations for assessing industrial noise impacts on marine ecosystems.

128. Notably, Dr Fournet credits the science in the Acoustics study, but criticizes its premise and scope, determined by TGS, as being inadequate in that the soundscape beyond the Project area is not assessed, and both the temporal and acoustic characteristics of the noise are too limited since they are focused on the impact of discrete, 24-hour, pulsive noise on low-frequency sound levels in an otherwise pristine marine environment.

Summary of Fournet's Comments on the Acoustic study

129. Dr Fournet's summary of her comments on the Acoustic study raises the following nine points, each highlighting critical gaps in information, the full details of which appear in her report:

129.1. **Inaccurate Assumptions in Acoustic study:** The Acoustic study is

F115

based on incorrect assumptions, primarily focusing on short-term impacts from 24-hour airgun pulses. However, the actual project will involve 70 days of chronic, high-intensity noise, including both airguns and continuous vessel noise, leading to significantly higher impacts than modeled.

129.2. **Underestimated Noise Sources:** The Acoustic study overlooks the noise contributions from multiple sources, including support vessels and generator noise, which affect both low and mid-frequency ranges critical to marine fauna and elicit behavioral responses. These omitted noise sources exacerbate the overall impact of seismic operations on the marine soundscape.

129.3. **Lack of Baseline Soundscape Assessment:** No baseline data on natural ambient noise levels or soundscape characteristics in the project area were collected, making it impossible to accurately assess how much the proposed activities would increase ambient noise levels.

129.4. **Broader Spatial Impact Unaccounted For:** The Acoustic study fails to quantify how far noise will travel beyond the project area, particularly into Critical Biodiversity Areas (CBAs) and Marine Protected Areas (MPAs), where noise could have far-reaching ecological consequences.

129.5. **Insufficient Consideration of Ecosystem-Level Consequences:**

FWS

The Acoustic study focuses primarily on direct physical injuries (such as hearing loss) but does not adequately address the indirect effects on behavior, communication, and predator-prey dynamics, which could disrupt entire ecosystems.

129.6. **Failure to Address Behavioral and Population-Level Impacts:** Noise-induced behavioral changes, such as altered communication or abandonment of critical habitats, are not properly assessed. These changes could lead to population-level consequences, affecting reproduction, survival, and overall ecosystem stability.

129.7. **Outdated Noise Thresholds and Methodologies:** The Acoustic study relies on outdated sound exposure thresholds that fail to account for the chronic nature of the project's noise impacts. In her report Fournet points out that the Acoustics study heavily relies on Southall (2019) to justify using certain thresholds to determine varying levels of risk, while omitting the caveats included in the 2019 publication. Southall (2019) states that *"The approaches in Southall (2019) are not applicable in evaluating potential auditory effects of chronic noise exposure over periods of weeks, months, or years."*

129.8. **Missing Quantification of Impacted Marine Animals:** The report does not estimate the number of marine animals likely to be affected by the noise, nor does it consider the heightened vulnerability of specific demographics, such as breeding males or nursing females, to noise

exposure.

129.9. **Need for Scaled Sound Propagation Modeling:** The report requires a broader-scale sound propagation model and an assessment of the full spatial and temporal extent ensonification.

Summary of Fournet's comments on the Marine study

130. Dr Fournet's summary of her comments on the Marine study raises the following five points, each highlighting critical gaps in information, the full details of which appear in her report.

130.1. **Inadequate Consideration of Temporary Threshold Shifts** (TTS): Based on mitigation suggestions the Marine study considers TTS an acceptable post-mitigation outcome and fails to address the long-term consequences of temporary hearing loss to individuals of specific species or populations. There is also no consideration for the cumulative effects of multiple days of noise exposure. It overlooks more detailed approaches, such as assessing impacts based on species' sex and behavioral states, and neglects to estimate how much of the marine population will be affected by the 70-day project.

130.2. **Chronic Noise Exposure Risks**: The Marine study downplays the significant risks of prolonged noise exposure for vulnerable cetacean

species (e.g., humpback whales, sperm whales, beaked whales). It fails to assess how chronic noise might cause stress, injuries, altered migration patterns, and permanent hearing loss. There is also no quantitative estimation of how habitat alteration might affect these species.

130.3. **Insufficient Mitigation for Acute Noise Impacts**: The mitigation strategies proposed, including a 500 m buffer zone, are insufficient to minimize acoustic impacts to marine species (e.g, beaked whales and cephalopods). This highlights a failure to align mitigation efforts with the real world risks.

130.4. **Failure to Address Population-Level Impacts**: The Marine study does not estimate how many individuals will be affected or assess the broader population-level consequences of direct or indirect harm, which downplays the long-term impacts of seismic exploration to this marine ecosystem.

130.5. **Omission of Soundscape Analysis**: The report neglects to assess the soundscape in relation to key oceanographic features (e.g., bathymetry, currents), despite sound being critical for marine organisms' interactions with their environment.

Critical failures of the BAR

131. Dr Fournet provides thirteen telling criticisms of the BAR, again highlighting critical gaps in knowledge. I summarize eleven of them here, and the other two, which relate to cumulative impacts, further below:

131.1. **Failure to Address Habitat Variability**: Since the Project area displays significant bathymetric variability due to significant variations in depth, with habitat use and biodiversity differing greatly throughout the area, mitigation measures should consider different operational behaviours based on habitats expected to harbour higher biodiversity or be home to species of concern. Ignoring habitat-specific sensitivities increases the risk of disrupting critical ecological processes.

131.2. **Inconsistencies within the BAR**: The BAR proposes a long-term soundscape analysis for acoustics mitigation but fails to specifically include this measure in mitigation plans or to indicate spatial and temporal extent as part of the preventive strategies. The BAR also specifically acknowledges the need to minimize ambient sound levels associated with seismic operations, yet requires no concrete mitigation measures regarding implementing technological or operational adjustments.

131.3. **Overly Optimistic Reliance on Marine Mammal Observers (MMOs) and Passive Acoustic Monitoring (PAM)**: The BAR fails to provide a clear scientifically driven, adaptive plan for real-time responses based

JCS

on monitoring during the seismic survey. MMOs are limited in the scope and scale of their observations, and PAM only captures loudly vocalizing animals (essentially omitting invertebrates and fish). Thus, while MMOs and PAM operators are crucial for reducing seismic operation impacts, they are not a panacea to address all potential risks.

131.4. **Incorrect Temporal Scale:** The BAR focuses on short-term acoustic impacts (seconds to hours), despite the project involving approximately 70 days of seismic operation. This narrow focus disregards the long-term implications of chronic noise exposure. Prolonged anthropogenic noise can lead to chronic cumulative effects and these impacts, especially over the course of two months, are more likely to disrupt population dynamics, such as habitat avoidance or disrupted breeding patterns, which were overlooked in the assessment. Noise from the seismic survey is both chronic and spatially far-reaching, making the BAR's temporal scope inaccurate.

131.5. **Unknowns Are Disregarded:** The BAR does not sufficiently account for unknown variables, including species-specific responses, role of behavioural states, and lack of biodiversity data and ecosystem sensitivities, thereby underestimating the potential impacts of the seismic activity on species and habitats. Uncertainty is inherent in ecological impact assessments, particularly when dealing with complex, dynamic marine ecosystems, making it essential to adopt the precautionary principle. The failure to collect baseline data significantly

increases uncertainty; despite this, the BAR does not recommend commissioning ecological studies to address biological unknowns.

131.6. **Disregard for Far-Field Sound**: The BAR does not adequately consider the effects of far-field sound, which can propagate over long distances and affect distant marine life. Seismic noise can travel thousands of kilometers, disrupting long-range communication among marine species such as cetaceans. Far-field sound from seismic airguns will extend well beyond the immediate operational area, including into Critical Biodiversity Areas (CBAs) and Marine Protected Areas (MPAs),yet the EIA does not quantify the extent or ecological consequences or far field sound, nor does the EIA recommend broader scale acoustic modelling.

131.7. **Generalized Masking Effects:** The BAR. acknowledges the importance of acoustic masking to marine organisms but overgeneralizes the effects of noise masking, failing to account for species-specific auditory ranges and behavioural needs. Different marine species rely on unique frequency ranges for communication, predator detection, and prey location. A generalized approach that does not differentiate between species' auditory sensitivities can result in inadequate mitigation. Masking effects should be assessed separately for each species, given their varying hearing thresholds and reliance on the sonic environment.

131.8. **Disregard for Chronic Impacts:** The BAR does not sufficiently consider the long-term effects of temporary injuries, such as hearing loss, resulting from seismic exposure, which can have severe long-term consequences if it impairs an animal's ability to communicate, forage, or avoid predators. Chronic exposure to noise may also lead to habitat abandonment or reduced reproductive success, ultimately affecting population resilience. Seismic operations, particularly over 70 days, will result in chronic, not just temporary, impacts, leading to long-term harm to individuals and populations that depend on the proposed permit region.

131.9. **Flawed Scoring System:** The BAR employs a scoring system that does not allow for population-level impacts or the meaningful incorporation of uncertainty. In data-deficient situations, this scoring system biases the assessment toward assuming minimal impact, leading to underestimation of real risks. There is a need to factor in uncertainty and variability in population responses to ensure a precautionary approach is taken.

131.10. **Inadequate Mitigation Zone:** The BAR's reliance on a 500 m mitigation zone is insufficient to protect marine life from the harmful impacts of seismic noise, especially given the repetitive use of airguns over 70 days. The Acoustics Specialist Report explicitly indicates that behavioural impacts are expected for marine mammals at distances up to 3.8 km from the array source and for fish at 1.3 km. Similarly, a zone

of 2-5 km is necessary to avoid significant impacts on squid and other cephalopod.

131.11. **Failure to Use Best Science:** The BAR fails to incorporate the best available scientific practices in its mitigation strategies. For example, in the absence of comprehensive biological surveys, best practice recommends assuming the presence of sensitive species and applying conservative mitigation measures to avoid harm. The reliance on outdated scientific recommendations from the Acoustics study results in insufficient mitigation strategies.

132. Dr Fournet's report, read with the information that was before the decision-makers, reliably identifies critical gaps in knowledge in the information before the decision-makers.

133. An affidavit of Dr Harris will be filed together with this affidavit, confirming the contents of a report by her, Dr JM Olbers and Dr K Wright dated 10 November 2024, in which they express their opinion in regard to the BAR. The opinion of the learned authors is summarized as follows:

133.1. The proposed seismic surveys for reconnaissance pose an unacceptable acoustic and ecological risk to the marine ecosystems and species in South African waters.

JWS

133.2. With reference to point 3.2 of the EA, where seismic surveys are described as:

> "generally regarded as non-intrusive in nature", and although states that "the technology poses potential impacts on fisheries and marine fauna,.....the majority of the impacts were assessed to range between low to very low significance with mitigation"

they express the opinion that the acute anthropogenic noise over a prolonged period of time, and the extensive survey gear in the water is an ecological risk to threatened and protected marine fauna that primarily use sound to survive and/or are unable to avoid the area of impact.

133.3. They disagree with the finding of the BAR and Reasons for Decision in the EA, that seismic surveys are regarded as 'non-intrusive', especially when the report clearly acknowledges the presence of impacts, before assessing their significance as low despite the impacts being largely unknown.

133.4. To understand the risk of seismic surveys on cetaceans, the population status of species of concern needs to be established.

134. The opinion of Dr Harris is consistent with the opinion expressed by Dr Fournet.

JCS

Gaps in knowledge reported in the BAR

135. The BAR (in para 12.2 on pg 260) identifies certain information gaps as follows:

"Information gaps include:

- *details of the benthic macrofaunal communities beyond the shelf break;*
- *details on demersal fish communities beyond the shelf break;*
- *information specific to the marine communities of seamounts (Tripp Seamount, Child's Bank) and submarine canyons (Cape Canyon and Cape Point Canyon); and*
- *current information on the distribution, population sizes and trends of most cetacean species occurring in South African waters and the project area in particular.*

Keeping these information gaps in mind, the assessment of impacts has adopted a strongly precautionary approach."

136. How the precautionary approach was allegedly adopted in the BAR is indicated in Table 6 of the BAR, which is the 'Need and Desirability' analysis. In para 1.8.3 on p 24 of the BAR, in describing how a risk-averse and cautious approach was purportedly applied in terms of ecological impacts, the BAR states:

"As a result of the fact that this project entails only survey activities, it is

EWS

anticipated that this project will not lead to a significant impact on the receiving environment. Refer to the impact assessment in Section 9 of this report. There is a deficiency in terms of local research in SA waters, but that international research is, in the view of the specialists, adequate for predicting risk-result and risk has been identified as low. Recommendations have been included to take the opportunity presented by this project to enhance/encourage site-specific local research."

137. **Furthermore, para 2.6.3 in Fig 6 on p 28 of the BAR, in describing how a risk-averse and cautious approach was applied in terms of socio-economic impacts, states:**

"The level of risk is low as the project is not expected to have far reaching highly negative impacts on socio-economic conditions. The survey area is located 120 km offshore, outside of the fisheries ringfence area. Since the survey activities will not include any drilling at this stage, a risk averse and cautious approach has been implemented to limit the impact on the surrounding environment."

138. **The BAR does record the following gaps in knowledge, reinforcing how widespread these gaps are in the context of this EIA:**

138.1. on pg 58 of the BAR: *"To date very few areas on the continental slope off the West Coast have been biologically surveyed (Sink et al. 2019;*

Harris et al. 2022)."

138.2. in para 8.4.1.1 on pg 61 of the BAR, relating to the impacts on benthic invertebrate macrofauna: *"The 2018 National Biodiversity Assessment for the marine environment (Sink et al. 2019) points out that very few national IUCN Red List assessments have been conducted for marine invertebrate species to date owing to inadequate taxonomic knowledge, limited distribution data, a lack of systematic surveys and limited capacity to advance species red listing for these groups. ...*

138.2.1. *"Information on the benthic fauna of the lower continental slope and abyss (beyond 1 800 m depth) is largely lacking due to limited opportunities for sampling. ...*

138.2.2. *"The 2018 National Biodiversity Assessment for the marine environment (Sink et al. 2019) points out that very few national IUCN Red List assessments have been conducted for marine invertebrate species to date owing to inadequate taxonomic knowledge, limited distribution data, a lack of systematic surveys and limited capacity to advance species red listing for these groups."*

138.3. in para 8.4.3.4 on pg 80 of the BAR, relating to the impacts on leatherback turtles (whose conservation status is endangered or vulnerable – Fig 10): *"Their abundance in the study area is unknown but expected to be low."*

JLDS

138.4. in para 9.3.3.2 on pg 215 of the BAR, relating to the impact of sound on catch rates: *"Existing experimental data regarding recoverable injury for fish eggs and larvae is sparse and no guideline recommendations have been provided. However, based on a subjective approach, noise impacts for fish eggs and larvae are expected to be moderate at the near field (i.e. in the distance of tens of meters) from the source location, low at intermediate (i.e. in the distance of hundreds of meters) and far field (i.e. in the distance of thousands of meters) from the source location."*

138.5. in para 11.1.1 on pg 238 of the BAR, relating to noise and acoustics: *"Existing experimental data regarding recoverable injury and TTS impacts for fish eggs and larvae is sparse and no guideline recommendations have been provided. However, based on a subjective approach, noise impacts are expected to be moderate for fish eggs and larvae. Impact is expected to be low for all of them at intermediate and far field from the source location."*

138.6. in para 9.3.2.4 on pg 221 of the BAR, relating to cumulative impacts: *"Due to the dearth of information on the impacts of seismic noise on truly pelagic species links between changes in migration patterns and subsequent catches thus remains speculative."*

138.7. in para 6.2 on pg 33 of the BAR, relating to layout alternatives: *"Most of*

BCS

the ecosystem types in the Reconnaissance Permit Area are either poorly protected or not protected. CBAs within the Application Areas include both CBA1: natural and CBA2: natural areas (see Figure 91)."

138.8. in para 8.4.1.1 on pg 56 of the BAR, relating to impacts on benthic invertebrate macrofauna: *"The benthic biota of unconsolidated marine sediments constitutes invertebrates that live on (epifaune) or burrow within (infauna) the sediments and are generally divided into macrofauna (animals >1 mm) and meiofauna (<1 mm). Numerous studies have been conducted on southern African West Coast continental shelf benthos, mostly focused on mining, pollution or demersal trawling impacts [citing the studies]. These studies, however, concentrated on the continental shelf and nearshore regions, and consequently the benthic fauna of the outer shelf and continental slope (beyond ~450 m depth) are very poorly known. This is primarily due to limited opportunities for sampling as well as the lack of access to Remote Operated Vehicles (ROVs) for visual sampling of hard substrata."*

138.9. in para 8.4.1.1 on pg 58 of the BAR, relating to impacts on benthic invertebrate macrofauna: *"To date there have been no studies examining connectivity between slope, plateau or abyssal ecosystems in South Africa and there is thus limited knowledge on the benthic biodiversity of all three of these broad ecosystem groups in South African waters (Sink et al. 2019). There is no quantitative data*

describing bethyal ecosystems in South Africa and hence limited understanding of ecosystem functioning and sensitivity (Anderson & Hulley 2000; Harris et al 2022) Due to the lack of information on benthic macrofaunal communities beyond the shelf break, no description can be provided for the offshore portions of the Reconnaissance Permit Area. However, as these communities would receive the sound in the far field only, no detrimental effects to the communities or to individual benthic species are expected."

138.10. **in para 4.4.3.6 on pg 68 of the BAR, also relating to the impacts on marine mammals at:** *"Altogether 17 species are listed as 'data deficient' underlining how little is known about cetaceans, their distributions and population trends. The offshore areas have been particularly poorly studied with most available information from deeper waters (>200 m) arising from historic whaling records prior to 1970. In the past ten years, passive acoustic monitoring and satellite telemetry have begun to shed light on current patterns of seasonality and movement for some large whale species (Best et al. 2009; Elwen et al. 2011; Rosenbaum et al. 2014; Shabangu et al. 2019; Thomisch et al. 2019) but information on smaller cetaceans in deeper waters remains poor. Records from marine mammal observers on seismic survey vessels have provided valuable data into cetacean presence although these are predominantly during summer months (Purdon et al. 2020). Information on general distribution and seasonality is improving but data population sizes and trends for most cetacean species occurring on the west coast of*

TOS

southern Africa is lacking."

138.11. in para 8.6.2.3 on pg 159 of the BAR, relating to sensitive areas: *"Most of the ecosystem types in the Application Area are either poorly protected or not protected."* [See map Fig 90 p 160]

138.12. in para 12.3 on pg 261 of the BAR, relating to the assumptions and limitations relating to fisheries: *"The effects of seismic sound on the CPUE of fish and invertebrates have been drawn from the findings of international studies. To date there have been no studies focused directly on the species found locally. Although the results from international studies are likely also to be representative for local species, current gaps in knowledge on the topic lead to uncertainty when attempting to accurately quantify the potential loss of catch for each type of fishery. Research into the effects of seismic sound on marine fauna is ongoing."*

138.13. And in the executive summary on noise/ acoustics on pg xviv of the BAR: *"The Application Area falls into the Southeast Atlantic Deep Ocean Ecoregions. Although there is a lack of knowledge of the community structure and diversity of benthic macrofauna off the shelf edge, the South Atlantic bathyal and abyssal unconsolidated habitat types have been rated as 'Least Threatened', reflecting the great extent of these habitats in the South African Exclusive Economic Zone (EEZ)."*

ACOS

139. In the light of the reported gaps in knowledge, a more stringent application of the precautionary approach was called for. This is reinforced by the unreported gaps in knowledge that I have set out above.

140. Despite the assurances by the decision-makers that they considered all the material before them, lacking as it was crucial information, it is evident from the reasons for their decisions that they failed to give it due consideration.

Mitigation measure of a shorter window period was not considered

141. An example of the irrationality of the EA and the Minister's decision relates to the critical mitigation measure of approving the appropriate window within which to conduct the 70-day survey.

142. The EMPr, which was approved in the EA, requires the survey to take place in the period from January to May. That is a period of 151 days to conduct a survey that only requires a maximum of 70 days.

143. The reasons why the January to May window was selected are not explained in the BAR or the EMPr.

144. The BAR states that the feeding peak in the Benguela current off the west coast is "spring and early summer (October - February)" (BAR pg 95), and that Humpback whales are likely to be the most frequently encountered baleen

TCOS

whale in the project area, ranging from the coast out beyond the shelf, with year round presence but numbers 'peaking during the northward migration in June – February" (BAR pg 96).

145. This would indicate that the months of January and February are less favourable months within which to conduct the seismic survey.

146. It is not explained in the BAR, the EMPr or the EA or the Minister's decision why a window from March to May (92 days) would not be sufficient.

147. TGS, in its response to the second and third applicants' appeal, stated that a four month window is proposed for the survey, to coincide with the period of lowest activities for the fisheries that operate in the potentially affected sectors. (The first bullet point on pg 47 in the extract from TGS's comments marked A13.1.)

148. No consideration was given to the alternative of a four-month window in the BAR or by the decision-makers.

149. The first ground of review is that the BAR omitted relevant information and considerations in respect of impacts on marine life, and that the decisions of the DG and the Minister were not rationally connected to the information before them, were irrational and/or unreasonable, and failed to give adequate consideration to the precautionary principle, in breach of sections 24O(1)(b), 24(4) and 2(4)(a)(vii) of NEMA, and Regulation 41(6) of the EIA Regulations.

A105

The EA and the Minister's decision to uphold it are accordingly reviewable on one or more of the following PAJA review grounds:

149.1. a mandatory and material procedure or condition prescribed by an empowering provision was not complied with, as contemplated in section 6(2)(b) of PAJA;

149.2. relevant considerations were not considered, as contemplated in section 6(2)(e)(iii) of PAJA;

149.3. the action was procedurally unfair, as contemplated in section 6(2)(c) of PAJA;

149.4. the EA and appeal decision contravened a law and were not authorised by the empowering provision, as contemplated in section 6(2)(f)(i) of PAJA); and

149.5. the EA and the Minister's decision are not rationally connected to the information before them, as contemplated in section 6(2)(f)(ii)(cc) of PAJA.

150. Alternatively, the EA and appeal decision are reviewable in terms of the constitutional principle of legality.

Review Ground 2 – Public Participation

AOS

151. The second ground of review is that the public participation process followed in the EIA did not ensure that persons in vulnerable and disadvantaged communities were given sufficient opportunity to develop the understanding, skills and capacity necessary for achieving equitable and effective participation, or ensure that community well-being and empowerment was adequately promoted through environmental education, the raising of environmental awareness, the sharing of knowledge and experience and other appropriate means.

152. Public participation must be meaningful and sufficient to give effect to the constitutional rights of the affected communities in the Bill of Rights, including their rights to administrative justice, to health and well-being, to human dignity, and to equality.

153. Section 2(4)(f) of NEMA states that that the participation of all interested and affected parties in environmental governance must be promoted, and all people must have the opportunity to develop the understanding, skills and capacity necessary for achieving equitable and effective participation, and participation by vulnerable and disadvantaged persons must be ensured.

154. Section 2(4)(h) of NEMA states that community well-being and empowerment must be promoted through environmental education, the raising of environmental awareness, the sharing of knowledge and experience and other appropriate means.

FOS

155. In this matter, the EAP did not achieve the objectives of sections 2(4)(f) or (h) of NEMA in respect of people like me in marginalised and disadvantaged communities.

156. Although the EIA Regulations have a standard set of minimum requirements related to public participation, they apply equally to all types of applications for EA. For example, the minimum public participation required to apply for an EA to develop a jetty in an estuary (Listing Notice 1 activity 17), is the same minimum public participation process as the present matter.

157. Compliance with the minimum requirements in the EIA Regulations does not necessarily imply that public participation is effective, or that it fulfils the objectives of NEMA contained in section 2(4)(f) and (h).

158. This failure is abundantly clear from the findings and recommendations in the SIA, referred to below.

159. The social background reflected in the BAR (in par 9.3.1.1 on pg 222) states in relation to the impacts on social heritage: "*The public meetings and focused discussions with interlocutors have shown that these communities and groupings are struggling economically due to decades of turmoil in the fishing industry.*"

160. The BAR (in par 11.1.5 on pg 245), in regard to the social assessment states:

"TGS, as well as other companies that want to do surveys or exploration in the area, currently do not have social license to operate. A large part of this is due to a lack of meaningful consultation by previous applicants from a community perspective. If TGS or any other seismic survey company wants to proceed with the project, they will need to engage in meaningful conversation with the communities and try to restore relationships. From a community and social risk perspective this is not negotiable."

161. The BAR states further, *"From a social perspective it is recommended that the project proceed subject to the mitigation measures (i.e. meaningful consultation, local research, education, and awareness raising in the project-affected communities) forming part of the conditions for authorisation and being implemented prior to the commencement of the actual survey."*

162. The recommended mitigation measures for implementation were the following (SIA para 9 pp 108-109):

162.1 **TGS should develop a community engagement protocol that is based on the San Code of Research Ethics. This should be done in consultation with the affected communities. This should include a communication strategy and grievance mechanism.**

162.2 **TGS should contribute to assisting with collaboration on independent research on how fish species on the West Coast such as snoek respond to seismic surveying. Collaboration across seismic operators**

with holders of hydrocarbon exploration and the industry as a whole to collectively fund pro-active research would provide opportunity for the development and implementation of a structured and experimentally sound acoustic study. This would quantitatively inform the authorities and stakeholders of acoustic impacts to the various faunal groups in South African Waters.

162.3 Consult with communities on potential ways in which to make a positive contribution to the communities.

162.4 A representative from TGS should consult with the traditional leadership of the affected communities to establish what their understanding of meaningful consultation is and how communities should be consulted in future. This will assist with establishing the relationship between TGS and the traditional communities. Given the socio-political environment, opposition to the project and associated non-technical risks, further meaningful engagement with the leadership and communities are critical from a social perspective. Given the risk of stakeholder fatigue, it would be most beneficial if this can take place on an industry level.

162.5 TGS should initiate discussions in the industry. The seismic survey industry should re-assess their position and social licence to operate as an industry in a South African context and conduct a strategic environmental assessment of the impact of the industry and embark on an awareness raising and education campaign. Having meetings will

not be sufficient. Participatory processes and workshops where communities can engage in experiential learning should be considered. If the seismic survey industry fails to address the community's need for education and cooperation it will result in significant delays and increase the risk for social unrest.

163. Both the SIA and the HIA are dated September 2022, that is, after the initial public meetings were held in August 2022, and prior to the 30-day consultation period required for the BAR process, which took place in October and November 2022. In terms of the SIA, in September 2022, TGS had no social licence to operate.

164. This could not be, and was not, remedied by the 30-day public participation process in October and November 2022.

165. First I will summarise what took place in the pre-application meetings, and after that what took place in the BAR application meetings.

166. The record of public participation in Annexure A6.6 shows that six pre-application meetings took place, scheduled for a two-hour period from 16.00 to 18.00 on separate days between 29 August 2022 and 3 September 2022, in each of Hout Bay, 3-Anchor Bay, Saldanha Bay, Lamberts Bay, Hondeklip Bay and Port Nolloth.

166.1. I attended this meeting in Port Nolloth, where I live and work, although

my name does not appear in the attendance register. In previous EIA processes, consultants have used meeting registers to claim that people support their projects. Because of this, myself and other small-scale fishers do not want to sign the register as we outright reject the tick-box exercise of consultation that is carried out by the EAP.

166.2. There are no attendance lists for Hout Bay, 3-Anchor Bay or Port Nolloth meetings.

166.3. It appears from the minutes of the meetings that two people participated in Hout Bay, four in 3-Anchor Bay, and that the meeting in Hondeklip Bay was only attended by three Petroleum Association of South Africa (PASA) members apart from the presenters.

166.4. From the attendance lists it appears that the attendance at Saldanha Bay was 21 people, at Lamberts Bay 52 people, and at Hondeklip Bay 23 people, including the presenters, but I do not know how many people were there and whose names do not appear on the attendance registers.

166.5. The minutes of these pre-application meetings show that the two presentations in A6.6 were made, one on the consultation process and the way ahead – approximately seventeen pages/slides – followed by a chance for questions, and the second one an outline of the project – approximately twenty five pages/slides, about half of which provided

technical information which was relatively superficial. In both presentations it was indicated that thorough public participation would take place in the EIA process.

167. The public participation process in regard to the Draft BAR, according to Annexure A6.9, consisted of notices of the process, a 30-day comment period, and meetings. A two-hour meeting was held either between 10.00 and 12.00 or between 16.00 to 18.00, in each of the following eight places between 31 October and 5 November 2022:

167.1. on Tuesday 1 November 2022, afternoon meetings in Port Nolloth, attended by 11 people, and Hondeklip Bay, attended by 23 people, and a morning meeting in Garies from 10.00 to 12.00 attended by 12 people, according to the attendance registers.

167.2. I attended the meeting in Port Nolloth but my name does not appear on the attendance register.

167.3. on Thursday 3 November 2022, morning meetings in Lamberts Bay, attended by 19 people, St Helena Bay, attended by 8 people, and afternoon meetings in Saldanha Bay, attended by 18 people, and Sea Point, attended by 8 people;

167.4. on Saturday 5 November 2022 a morning meeting in Hout Bay,

TDS

attended by 7 people; and

167.5. including the presenters, a total of approximately 106 people attended the public meetings regarding the Draft BAR.

168. It is not stated in the BAR or the expert studies what the population numbers of the relevant coastal communities are. The SIA gives the populations of the local municipalities (in Table 1 on pg 54), and the combined total of the affected district municipalities, which are Namakwa and West Coast District Municipalities, which is 551,891 people (2016).

169. The number of participants in the small-scale fishing communities along the South African west coast is estimated to be approximately between and 2500 and 5000. (Marine study, Figure 83 on pg 149.)

170. The participation of the small-scale fishing communities in the public participation process was very low in the circumstances, even allowing for a small number of people who did not sign the attendance registers.

171. The minutes of the meetings support the observations and findings in the SIA mentioned above.

172. A factor highlighted in the SIA was stakeholder fatigue and disillusionment, something I personally can vouch for strongly.

172.1. The SIA states that stakeholder disillusionment is related to stakeholder fatigue, which can occur during a project or can be a legacy of past involvement in stakeholder participation. (SIA para 8.3.7 on pg 98.)

172.2. The same party who conducted the public participation in the present matter conducted a similar public participation process for another reconnaissance project, TEEPSA, between July 2022 and August-September 2022, overlapping with the TGS public participation, which was in August and October-November 2022.

172.3. During the same period, SLR Consulting (Pty) Ltd conducted an EIA public participation process on behalf of TEEPSA in relation to an exploration licence for drilling, in June-July 2022, and Triplo4 Sustainable Solutions conducted an EIA public participation process in relation to an application by Karpowership Saldanha relating to power generation from gas, in October-November 2022.

172.4. In addition to these oil and gas projects, our west coast communities are also facing multiple applications for mining activities along the coast and near to us, which also have EIA processes ongoing, calling for comments and in some cases, public meetings.

172.5. The Draft BAR documents made available to the communities in the present matter are voluminous. The Draft BAR report, the EMPr and the five expert reports alone run to over a thousand pages, and are very

complex. The documents in the other matters were no less voluminous or complex.

172.6. Neither I nor the small-scale fishers I know had the capacity to understand what was contained in the Draft BAR well enough to engage on the science and intricacies of the application process without assistance.

172.7. I myself dropped out of school in grade 8. In our community it was common for black and coloured people not to complete basic education under the Apartheid system.

172.8. No attempt at capacity-building was made in order to remedy this.

172.9. As an example of the stakeholder disillusionment and fatigue, at the meeting in Hondeklip Bay on the Draft BAR, the minutes show that John Adams stated: *"The meeting goes too fast. We want to understand how the process runs from point A to point B. We're a bit confused because it's a similar submission that's being done, for another company, and it's said that it's just comments, but then we'll hear at a next time there's an application. We are needy communities and have in the past suggested that plans be made to see if anything can be done here. I would also like to understand just what was said in the meeting in Garies."*

172.10. Others from the small-scale community expressed concern about the

impacts of oil and gas, disappointment at being excluded from the benefits of the oil and gas industry, and scepticism about promises made. The level of engagement shows very little knowledge of the assessment and mitigation of social, economic and environmental risks in the Draft BAR.

172.11. A comment recorded at the Lamberts Bay meeting on the Draft BAR by Chief Regan James was, *"How far is the application area from the country? And how far does the sound travel from the boat? From our side, our sonar messes up the fish's heads. We are not against projects, but now you are coming to us. Ever since they started with the oil and gas surveys a long time ago and now there are no more fish left. It is unacceptable to us that you now come to the communities and explain, where you should have come and talked to us in the first place and asked permission to do the studies."*

172.12. The ability of vulnerable communities to effectively participate in the process in the circumstances requires considerably more than was done by TGS in this matter.

173. I attach hereto confirmatory affidavits by John Adams, Chief Regan James and Carmelita Mostert, being community members who attended some of the information sessions. We also assisted Jacqueline Sunde and attach her confirmatory affidavit.

JWS

174. It is inconceivable to me that affected coastal communities were able to respond to each of these processes in a meaningful way. Fishers must fish for a living, requiring them to be out at sea daily or for extended periods of time during the fishing seasons; March to July is snoek season and 15 October to 15 February is the usual lobster season. Even if we wish to do so, we do not have the time or resources to attend multiple public meetings, engage with voluminous technical information in our comments.

175. The result, even if unintended, is that those of us who have less resources, who are required to be out at sea to make our livelihoods, and who are unable to fully understand the different proposals and processes, are not able participate and engage meaningfully.

176. The chilling effect is that we are significantly prejudiced by the onslaught of applications.

177. There are many people, particularly those of us in the small-scale fishing communities and co-operatives, who will be impacted by the project and who do not have access to the resources and expertise required to access, consider and comment on the records relating to the project, which are voluminous and technical in nature.

178. Annexure A12.5 hereto, which was attached to the second and third applicants' appeal, is a letter from Carmelita Mostert which was also separately sent to the Appeals Authority, clearly sets out opposition to the seismic surveys based on

FRS

the impact on fisheries, and points out their difficulties with having to find hardcopy reports and with having to consider how her community's comments have been considered by the EAP.

179. To ensure access to a reasonable, adequate and fair public participation process, TGS and its appointed EAP and consultants should have used reasonably distinctive and appropriate alternative methods to inform and educate affected communities and small-scale fishers of the significant adverse impacts that this project could have on them.

180. Running a public participation process during the 30-day time period could not achieve meaningful and effective consultation. Much more should have been done in the pre-application and application phases.

181. The Department of Environmental Affairs has published a *Guideline on Public Participation* in terms of NEMA as a guide. This is an "implementation guideline" contemplated in section 24J of NEMA and accordingly its contents were a relevant factor in the decision-making process in terms of section 24O(1)(b)(viii).

182. The NEMA guideline on public participation provide, among others, that the public participation process must:

182.1. provide for the opportunity for all role players to obtain clear, accurate and understandable information about the environmental impacts of the

proposed activity or implications of a decision;

182.2. provide for role players to voice their support, concerns and questions regarding the project, application or decision;

182.3. to provide opportunities for clearing up misunderstandings about technical issues, resolving disputes and reconciling conflicting interests;

182.4. to encourage transparency and accountability in decision-making;

182.5. to contribute toward maintaining a healthy, vibrant democracy;

182.6. consider the use of the following PP mechanisms over and above the requirements: public meetings and open days; conferences; press releases; questionnaires or opinion surveys; information desks and/or info lines (helpline); web-based platforms/social media; and meetings/workshops with constituencies; and

182.7. where IAPs include rural or historically disadvantaged communities, consider the following in order to facilitate their participation or overcome potential constraints:

182.7.0. announcing the PPP on a local radio station in a local language, at an appropriate time (e.g. peak hours);

182.7.1. using participatory rural appraisal and participatory learning and action approaches and techniques to build the capacity of the IAPs to engage and participate more effectively;

182.7.2. specific approaches to existing community structures, committees and leaders;

182.7.3. holding public meetings at times and venues suitable to the community;

182.7.4. holding separate meetings with vulnerable and marginalised groups; and

182.7.5. appropriate access to information must be provided.

183. The inclusion of the mitigation measures in the SIA referred to above, repeated in the Draft BAR, try to remedy the failures of the public participation process by means of mitigation after the granting of the EA. This does not remedy the failure of public participation in the BAR process.

184. The public participation process failed adequately to take into account the needs and values of the communities (and small-scale fishers) who were opposed to the seismic survey. Our voices in opposition to the seismic survey remained unheard in the final BAR and EA.

185. Engaging and involving coastal communities in the decision-making process is crucial. Meaningful consultation and participation allow communities to express their concerns, share their knowledge, and contribute to the development of effective mitigation measures. Failure to include the perspectives and needs of these communities can result in measures that do not adequately address our cultural and heritage associations and may lead to further marginalization.

186. Despite the apparent expert knowledge and the level of understanding expressed in the BAR, and recommendations made in the BAR regarding the potential effects of the seismic survey proceeding, it is clear that necessary deep conversations with coastal communities were not conducted.

187. This impacted negatively on the well-being of my community, and will also have negative consequences for future generations of small-scale fishers.

As a result of this,

188.1. the communities' identity, sense of place, and spiritual, cultural, and indigenous rights were not effectively upheld and protected; and

188.2. the decisions in this matter failed adequately to consider the interests, needs, and values of all interested and affected parties, including acknowledging all forms of knowledge, including traditional and ordinary knowledge.

189. Consequently, insufficient information was placed before the decision-makers, and he/she neglected to afford sufficient weight to the indigenous and cultural rights of coastal communities.

190. In light of the above, I submit that the public participation process, including the SIA conducted, did not constitute meaningful consultation with communities and local people (and in particular small-scale fishers), and that the mitigation measures requiring further consultation after the EIA has been conducted and a decision on authorisation made do not cure this flaw in the EIA process.

191. The second ground of review is that the public participation process followed by the EAP in the EIA process did not ensure that persons in vulnerable and disadvantaged communities were given sufficient opportunity to develop the understanding, skills and capacity necessary for achieving equitable and effective participation, or ensure that community well-being and empowerment was adequately promoted through environmental education, the raising of environmental awareness, the sharing of knowledge and experience and other appropriate means. The failure is in breach of Regulation 40 of the EIA Regulations read with section 2(4)(c), (f), (g), (h) (o) and section 24(1A)(c) of NEMA, with the NEMA Guideline on Public Participation, and with sections 9, 10, 24 and 33 of the Constitution. The EA and the Minister's decision to uphold it are accordingly reviewable on one or more of the following PAJA review grounds:

191.1. a mandatory and material procedure or condition prescribed by an

ATCOS

empowering provision was not complied with, as contemplated in section 6(2)(b) of PAJA;

191.2. relevant considerations were not considered, as contemplated in section 6(2)(e)(iii) of PAJA;

191.3. the action was procedurally unfair, as contemplated in section 6(2)(c) of PAJA;

191.4. the EA and appeal decision contravened a law and were not authorised by the empowering provision, as contemplated in section 6(2)(f)(i) of PAJA); and

191.5. the EA and the Minister's decision are not rationally connected to the information before them, as contemplated in section 6(2)(f)(ii)(cc) of PAJA.

192. Alternatively, the EA and appeal decision are reviewable in terms of the constitutional principle of legality.

Third Ground of Review – Need and Desirability

193. The third ground of review is that the Minister failed to consider the reduced need for the seismic survey due to part of the Project area already having been

TCOS

surveyed, and the BAR failed to conduct a rational assessment of need and desirability as required by regulation 18 of the EIA Regulations in that the BAR:

193.1. considered only the potential positive impacts of the production of oil and gas for the purposes of determining need and desirability and not the potential negative impacts thereof, which was inconsistent and irrational;

193.2. failed to conduct a proper assessment of the option of not implementing the activity; and

193.3. failed to conduct an assessment of the potential social, economic and environmental impacts of the exploration and production of oil and gas.

194. I will first explain the analysis that the EAP and the decision-makers were required to engage for purposes of the need and desirability inquiry, and after that explain what was in fact done.

Need and desirability properly construed

195. Regulation 18 of the EIA Regulations provides that:

"When considering an application the competent authority must have regard to section 24O and 24 (4) of the Act, the need for and desirability

of the undertaking of the proposed activity, the requirements of these Regulations, any protocol or minimum information requirements relevant to the application as identified and gazetted by the Minister in a government notice or any relevant guideline published in terms of section 24J of the Act."

196. One of the objects of a BAR, described in section 2(b) of Appendix 1 to the EIA Regulations, is to *"describe the need and desirability of the proposed alternatives"*. Section 3(1)(f) of Appendix 1 requires the BAR to contain *"a motivation for the need and desirability for the proposed development including the need and desirability of the activity in the context of the preferred location"*.

197. This assessment of "need and desirability" is fundamental to an environmental impact assessment process. It is the point of departure for the essential inquiry that must be undertaken by the competent authority in terms of NEMA – *viz.* are the adverse environmental impacts of the proposed activity justifiable in light of the positive socio-economic impacts? Put differently, does the proposal represent 'the best practicable environmental option"?

198. According to the Need and Desirability Guideline, the notion of "need and desirability" flows from the concept of sustainable development, which is guaranteed in section 24(b)(iii) of the Constitution and foundational to the system of environmental management provided in NEMA.

199. The need and desirability inquiry is a tool to ensure that sustainable

development is promoted in individual applications for environmental authorisation. Its purpose is to determine whether the proposed activity serves a broader societal purpose, such that any adverse environmental impacts are justified. This notion is captured in the Guideline as follows:

> *"Ultimately development must not exceed ecological limits in order to secure ecological integrity, while the proposed actions of individuals must be measured against the short-term and long-term public interest in order to promote justifiable social and economic development – i.e. ensuring the simultaneous achievement of the triple bottom-line. Considering the merits of a specific application in terms of the need and desirability considerations, it must be decided which alternatives represent the "most practicable environmental option", which in terms of the definition in NEMA and the purpose of the EIA Regulations are that option that provides the most benefit and causes the least damage to the environment as a whole, at a cost acceptable to society, in the long-term as well as in the short-term." (pg 10)*

200. Therefore, it must first be determined whether a societal *need* is in fact served by the proposed activity. The notion of "need" is clarified in the Guideline as follows:

> *"With regard to the issue of "need", it is important to note that this "need" is not the same as the "general purpose and requirements" of the activity. While the "general purpose and requirements" of the activity might to some extent relate to the specific requirements, intentions and reasons*

AJ JS

that the applicant has for proposing the specific activity, the "need" relates to the interests and needs of the broader public." (pg 10)

201. It must then be determined whether the proposal is *desirable* by reference to the identified need and in the light of any adverse ecological impacts. In essence, the question at this stage is whether the proposed activity is the best way of meeting the identified need, having regard to its particular environmental impact. For purposes of this analysis, the Guideline explains that:

> *"Consistent with the above aim and purpose of EIA, the concept of "need and desirability" relates to, amongst others, the nature, scale and location of development being proposed, as well as the wise use of land. While essentially, the concept of "need and desirability" can be explained in terms of the general meaning of its two components in which need primarily refers to time and desirability to place (i.e. is this the right time and is it the right place for locating the type of land-use/activity being proposed?), "need and desirability" are interrelated and the two components collectively can be considered in an integrated and holistic manner." (pg 10)*

202. As for the overall evaluation:

> *"The consideration of 'need and desirability' in EIA decision-making therefore requires the consideration of the strategic context of the development proposal along with the broader societal needs and the public interest. The government decision-makers, together with the environmental assessment practitioners and planners, are therefore*

accountable to the public and must serve their social, economic and ecological needs equitably. Ultimately development must not exceed ecological limits in order to secure ecological integrity, while the proposed actions of individuals must be measured against the short-term and long-term public interest in order to promote justifiable social and economic development." (pg 10)

203. Significantly, the point is made in the Guideline that "*what is needed and desired for a specific area should primarily be strategically and democratically determined beyond the spatial extent of individual EIAs.*" I wish to add at this point that I am advised that an environmental management instrument usually used for this purpose is a strategic environmental assessment ("SEA"), such as is called for in the mitigation measures contained in the SIA that I referred to above.

204. The Guideline (from pg 11) provides a list of questions intended to elicit information bearing on these essential questions, including:

204.1. *What is the socio-economic context of the area, based on... strategic plans, frameworks of policies applicable to the area?* [in the context of this application, it can be accepted that the relevant "area" is South Africa as a whole]

204.2. *Will the development complement the local socio-economic initiatives?*

204.3. *Considering the socio-economic context, what will the socio-economic impacts be of the development (and its separate elements/aspects), and*

FC 25

specifically also on the socio-economic objectives of the area?

204.4. *Do the proposed location, type and scale of development promote a reduced dependency on resources?*

204.5. *Does the proposed use of natural resources constitute the best use thereof? Is the use justifiable when considering intra- and intergenerational equity, and are there more important priorities for which the resources should be used (i.e. what are the opportunity costs of using these resources this the proposed development alternative?)*

205. Having regard to the above, it is clear that in the context of TGS's application, there is only one way of approaching the need and desirability inquiry:

205.1. The purpose of the reconnaissance activities is to establish whether oil or gas deposits are present in the project area as a first step toward the ultimate purpose of extracting this resource. The broader purpose to which the proposal is directed is thus (for purposes of this inquiry) oil or gas production.

205.2. Whether or not there is a need to produce oil or gas on the project area must be considered by reference to pertinent strategic plans and policies, which in these circumstances include the National Development Plan, the National Climate Change Response White Paper, LEDS 2050, the IRP 2019, and the marine spatial planning process in terms of the Marine Spatial Planning Act 16 of 2018.

205.3. If it is found that there is a need for oil or gas extraction, it must then be considered whether the project is a desirable way of meeting this need, having regard to its ecological and socio-economic impacts and the opportunity costs of the oil and gas exploration and production. This evaluation should, of course, begin with a consideration of whether there is another more sustainable way of meeting the need.

205.4. If there is no need for oil or gas production, or if extraction is not desirable, then the environmental, social and economic risks associated with exploration cannot be justified.

(a) Inconsistency

206. The analysis of environmental impacts of the Project is narrowly interpreted in the BAR, that is, with reference only to the specific seismic activities in the Project area. However, it gives a wider interpretation to the positive impacts of the Project for the purposes of need and desirability. This gives rise to a fundamental inconsistency in the analysis of need and desirability in the BAR.

207. The same inconsistent approach was adopted by the decision-makers.

208. The BAR discusses need and desirability in Part 5 in page 21. It refers to the Need and Desirability Guideline and purports to comply with it. The BAR (at pp 33 – 34) describes in detail South Africa's need for natural gas for the

generation of electric power, based on the lower carbon omissions compared to coal and oil, its potential as a transition fuel on the path to the carbon neutral goal of the Paris agreement, the 2019 IRP and government policy, among others.

209. The BAR summarises the positive aspects of the Project (on pg 238) as, firstly, the opportunity to identify potential oil and gas resources within the Project area, including potential future contribution to the economy of South Africa; secondly, the opportunity to conduct independent research on how fish species on the West Coast such as snoek respond to seismic surveying; and thirdly, the provision of job or training opportunities (described as very limited).

210. The BAR explains the need for the acquisition of the seismic data based primarily on the possible oil and gas exploration and production that could potentially take place in the future as a result of the survey. However, the BAR declines to report on, consider or assess the environmental impacts and risks associated with oil and gas exploration and production that could potentially take place. The reason it gives for not doing so is that the specific details of these potential future activities are not known, and that they would need to be assessed in detail during subsequent scoping and EIA processes, should exploration drilling or production be proposed (BAR para 5.2 with heading "*The Need for Seismic Data*" on pp 33 – 34.)

211. I understand that, in terms of the EIA Regulations, seperate applications would need to be made for EA in respect of an offshore exploration right and for a

production right. At those stages, more specific details of the respective projects and their impacts would be assessed.

212. I shall set out below the reasons why it is possible to estimate the impacts related to production sufficiently for the purpose of considering the need and desirability of a seismic reconnaissance survey. The BAR should have done this, and its failure to do so gave rise to the fundamental inconsistency I have referred to.

213. The applicants' hold that it is artificial not to consider the potential positive and negative impacts of the production of oil and gas for the purposes of assessing need and desirability of reconnaissance to the extent that they can be considered at this stage. For this reason I shall set out relevant information in this regard, which provides a basis for such assessment, and which was not considered by the DG or the Minister.

214. Even if it were to be found that it is not feasible to estimate the impacts related to production sufficiently for the purpose of considering the need and desirability of a reconnaissance survey, and the negative impacts and risks of production should not be assessed, consistency would require that the benefits thereof should also not be considered for the purposes of need and desirability. The decisions of the decision-makers would accordingly still be irrational.

(b) The alternative of not proceeding with the activity

215. The BAR failed to conduct a proper assessment of the alternative of not implementing the activity and contained no information regarding the likelihood that the reconnaissance activities in this matter will disclose the presence of viable hydrocarbons in the sea bed.

216. Whether or not the reconnaissance activities in this matter will disclose the presence of viable petroleum in the sea bed is unknown. The BAR contains no information regarding the likelihood thereof. A possible result of the seismic survey is that there are no viable petroleum resources.

217. All the BAR says in this regard (in para 5.2 regarding the need for seismic data, on p 32.) is *"It cannot be said with absolute certainty that exploration drilling, let alone production activities, will be undertaken in the future."*

218. The question whether the cost of acquiring the seismic data, in the light of a proper understanding of need and desirability, exceeds the benefit of doing so was not considered in the BAR, and there is no indication that it was considered by the decision-makers either.

219. Section 24(4)(b)(i) of NEMA requires an EIA to investigate the potential consequences or impacts of the alternatives to the activity, including the option of not implementing the activity.

220. The summary of the positive and negative impacts and risks of the proposed activity and identified alternatives in Chapter 11 of the BAR does not contain

FMS

any assessment whatsoever of the alternative of not implementing the activity, and the benefits thereof.

221. The BAR, in Chapter 9.3, on the description and assessment of impacts, at p 236, purported to investigate the alternative of not implementing the activity, but did so in a perfunctory manner with no risk assessment or proper investigation and assessment. All that the BAR says is the following:

> *"9.3.6 NO-GO ALTERNATIVE*
>
> *The no go alternative would imply that no survey activities are undertaken and, as such, the negative impacts as stated above, would not materialise. However, conversely, this will negate the potential positive impacts associated with the proposed survey activities, including:*
>
> - *The opportunity to identify potential oil and gas resources within the Application Area including potential future contribution to the economy of South Africa;*
> - *opportunity to conduct independent research on how fish species on the West Coast such as snoek respond to seismic surveying; and*
> - *Provision of job or training opportunities (very limited during the survey phase).*
>
> *Since there are no mitigation measures, the impact significance will be low pre- and post-mitigation and final significance will be the same."*

222. The option of not implementing the activity is mentioned nowhere in the impact matrix in Appendix 4 to the BAR, Annexure A8 hereto.

223. The assessment of the alternative of not proceeding should have taken into consideration the fact that other seismic surveys reconnaissance permits have been applied for and granted in respect of the same area, as reported in the BAR, and one survey has already commenced, as I shall detail in a further ground of review below. The reported need may be met by other means if the Project does not proceed.

224. The failure properly to assess and evaluate the option of not implementing the activity fundamentally skewed the BAR's analysis of need and desirability, and was also in breach of the EIA Regulations which require that alternative to be assessed.

(c) The impacts of production of natural gas

225. In this section I summarise considerations that the decision-makers should have considered in the EIA process but did not because they were not contained in the BAR, due to the flawed interpretation of need and desirability.

226. The exploitation of natural gas as a non-renewable resource falls under the overarching legislation for energy governance in South Africa, namely, the National Energy Act, 34 of 2008 ("the Energy Act"), whose objects include, "[illegible]

ensure that diverse energy resources are available in sustainable quantities and at affordable prices, to the South African economy in support of economic growth". (preamble)

227. Section 6 of the Energy Act mandates the Minister responsible for Energy to develop, review and publish an "integrated energy plan" for South Africa. In terms of section 6(e), the integrated energy plan must "take account of plans relating to transport, electricity, petroleum, water, trade, macro-economy energy infrastructure development, housing, air quality management, greenhouse gas mitigation within the energy sector and integrated development plans of local and provincial authorities."

228. The Electricity Regulation Act, No. 4 of 2006, establishes a national regulatory framework for the electricity supply industry and provides for matters related to electricity planning.

229. The types of new generating capacity that are brought online by the responsible organs of State is determined by the Minister responsible for Energy in terms of section 34 of the Electricity Regulation Act.

230. The integrated resource plan is a planning instrument provided for by the Electricity Regulation Act and the Electricity Regulations on New Generation Capacity, to guide such determinations and to direct how new generating capacity must be added to the electricity system.

231. The current iteration of the integrated resource plan is the Integrated Resource Plan 2019 ("the IRP 2019").

JC08

232. I shall set out the relevant considerations related to the production of natural gas under the following headings: firstly, climate change law and policy; secondly, the broader context of the project; thirdly, the relationship between reconnaissance, exploration and production; and fourthly, a rational evaluation of "need and desirability".

Climate change law and policy

233. Petroleum projects that could take place in the Project area have the potential to generate significant quantities of greenhouse gases ("GHGs") over their lifetime. They accordingly implicate domestic law and policy relating to climate change. I will outline the relevant statutory and policy framework below. Before I do so, it is necessary to explain the global context in which it arises, in terms of both science and law.

234. The phenomenon of "climate change" is explained in the National Climate Change Response White Paper, 2011 as follows:

> *"... an ongoing trend of changes in the earth's general weather conditions as a result of an average rise in the temperature of the earth's surface often referred to as global warming. This rise in the average global temperature is due, primarily, to the increased concentration of gases known as greenhouse gases in the atmosphere that are emitted by human activities. These gases intensify a natural phenomenon called the "greenhouse effect" by forming an insulating layer in the atmosphere that reduces the amount of the sun's heat that radiates back into space and therefore has the effect of making the earth warmer... GHGs are*

57.98

emitted from, and are reabsorbed by, a variety of natural sources, but the rate at which human economies and societies are emitting these gases far exceeds the capacity of natural ecosystems to reabsorb them. Increased industrial activity since the mid-18th century has led to a rapid increase in the atmospheric concentration of GHGs such as carbon dioxide, methane and nitrous oxide, in large part due to the burning of fossil fuels derived from oil, coal and natural gas." (pg 8)

235. Authoritative statements on climate change as a scientific phenomenon are produced periodically by the Intergovernmental Panel on Climate Change ("IPCC").

236. The IPCC is a body established by the United Nations to, among other things, produce reports on the latest scientific findings related to climate change. The work of the IPCC is performed by scientists nominated by 195 Member States. It produces a comprehensive evaluation of developments in climate science every five to seven years in the form of assessment reports.. It is currently in its seventh assessment cycle.

237. Based on the contents on the AR6 reports, it is reasonable to say that there is broad scientific consensus on the following essential positions:

237.1. The average global temperature of earth has already warmed by approximately 1.1°C above pre-industrial levels (the period before 1850) as a result of increased GHG emissions.

237.2. At a point between 1.5°C and 2°C warming, there is a risk that rising temperatures will activate what are referred to as "tipping points". A tipping point is a critical threshold beyond which the climate system will be irreversibly altered. The activation of multiple tipping points may lead to a feedback mechanism that sees global warming increase very rapidly. This is often referred to as "runaway climate change".

237.3. The expected consequences of runaway climate change would include significant sea-level rise, widespread species extinction, severe disruptions to agriculture, and large-scale displacement of human populations.

237.4. If warming is to be kept below 1.5°C, global GHG emissions need to reach net zero by around 2050.

238. Based on certain submissions made by TGS in its responding statement to the appeals, I have assumed that it agrees that action to mitigate climate change is necessary and that it will not place these issues in dispute in this application. I therefore will not adduce any material to substantiate these statements but reserve the right to do so should this become necessary.

239. Formal efforts by the global community to address concerns related to climate change in international law date back to the adoption of the United Nations Framework Convention on Climate Change ("UNFCCC") in 1992.

240. The object of the UNFCCC was to "stabilise greenhouse gas concentrations in

8625

the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system". All 197 member states of the UN, including South Africa, are parties to the Convention.

241. The UNFCCC requires that an annual "conference of the parties" is convened. The most significant instrument adopted under the UNFCCC was negotiated and drafted at the 21st conference of the parties – the "Paris Agreement". It has been ratified by 194 states, including South Africa.

242. The Paris Agreement records that the parties will endeavour to "hold the increase in the global average temperature to well below 2°C above pre-industrial levels" and "[pursue] efforts to limit the temperature increase to 1.5°C above pre-industrial levels" (art. 2). It binds the parties "to undertake and communicate ambitious efforts" in this regard (art. 3).

243. To this end, each of the parties is required, among other things, to communicate a "nationally determined contribution" ("NDC") on a five yearly basis, recording the reduction in GHG emissions that it intends to achieve (art. 4(2)).

243.1. Each successive NDC must be "a progression beyond" its predecessor and reflect that State's "highest possible ambition" (art. 4(3)).

243.2. Each of the parties must strive to formulate and communicate long-term low GHG emission development strategies (art. 4(19)).

244. South Africa's domestic law and policy relating to climate change is directed toward ensuring that we make our fair contribution to the global effort to reduce

AT 18

GHG emissions in terms of the Paris Agreement.

245. South Africa's most recent NDC was submitted to the UNFCCC in 2021 ("the NDC 2021"). It undertakes that national emissions of CO_2-eq will peak between 2020 and 2025 in a range from 398 to 510 megatons (Mt) of CO_2-eq, and thereafter plateau and decline.

246. To place this commitment in context, the National Greenhouse Gas Inventory Report, published by the Department of Environmental Affairs in 2015, indicates that South Africa's total gross GHG emissions (excluding forestry and other land use) increased by 23% between 2000 and 2015, rising from 439 Mt CO_2-eq to 541 Mt CO_2-eq. Forestry is treated as a "CO_2 sink" and reduced gross emissions by 5% in 2015. Accounting for this effect, South Africa's net GHG emissions in 2015 were 512 Mt CO_2eq. A subsequent National Greenhouse Gas Inventory Report published in 2023 showed that net GHG emissions had declined to 442 million tonnes in 2020. (For clarity, I point out that CO_2-eq is a standard unit used to express the climate impact of a given greenhouse gas; this is necessary because some gases trap more heat in the atmosphere than others).

247. A strategy for achieving the targets recorded in the NDC 2021 has been laid out in South Africa's Low Emissions Development Strategy 2050 ("LEDS 2050").

248. The point of departure in LEDS 2050 is the following "vision statement":

> *"South Africa follows a low-carbon growth trajectory while making a fair contribution to the global effort to limit the average temperature increase,*

while ensuring a just transition and building of the country's resilience to climate change."

249. The strategy focuses on four key sectors, namely, (i) energy; (ii) industry; (iii) agriculture forestry and land use; and (iv) waste. The focus on the energy sector is clearly explicable on the basis that it is the largest contributor to GHG emissions in South Africa. As is observed in LEDS 2050, South Africa is one of the top 20 global emitters and has a high dependence on fossil fuels (pg 1), and the energy sector accounted for 79.5% of the total gross emissions for South Africa in 2015 (pg 12).

250. Broadly stated, the LEDS 2050 lays down sector specific interventions as well as "cross-cutting measures to support low-carbon development". The specific interventions for the energy sector are addressed in section 4.1. It is explained in the introduction to this section that:

"Energy supply is the mandate of the Department of Mineral Resources and Energy. Decarbonisation of energy supply will largely be driven through the Integrated Energy Plan, the Integrated Resource Plan and the Industrial Biofuels Strategy, issued by the Department of Energy, the predecessor of this Department."

251. The integrated energy plan and the integrated resource plan are thus considered the primary instruments for decarbonising the energy sector. This is clear from the following statements in the same section:

"The IEP update with a clear trajectory for the energy sector is critical to guiding overall energy planning for the country, including in the context of this document to support a just transition away from fossil fuels towards a low carbon future." (pg 22)

"The Integrated Resource Plan (IRP) guides the evolution of the South African electricity supply sector, in that it identifies the preferred electricity generation technologies to be built to meet projected electricity demand. It thus provides a mechanism for Government to drive the diversification of the country's electricity generation mix and promote the use of renewable energy and other low-carbon technologies." (pg 23)

"The 2019 IRP is based on the current articulation of the PPD trajectory. Future updates to the IRP will need to take into account any future modifications to the emissions trajectory. In this way electricity supply planning will be aligned with the country's increasing national ambition." (pg 26)

252. The following passage is of relevance:

"On the one hand, rapid implementation must begin in all areas where pathways to achieving the Paris Goals are already clear (such as investments in renewable energy power generation, solar water heaters, etc) while on the other, steps taken will need to enable future action at

scale, as much as (or perhaps more than) drive immediate emissions reductions."

253. The envisaged "cross-cutting measures" are dealt with in section 4.6 (from pg 38). The following four measures are identified:

253.1. a carbon tax;

253.2. sectoral emissions targets;

253.3. carbon budgets; and

253.4. phasing out of fossil fuel subsidies.

254. Of particular relevance for present purposes are measures 1 to 3. Taken together, these measures envisage a regime in which all commercial actors in South Africa, (including those like Total, Shell and Petro SA who own blocks in the project area), will be required to operate with limits upon the GHGs that they can freely emit and will, in addition, be subject to a tax on their emissions.

255. The statutory framework necessary to implement this regime is now in place in the form of the Carbon Tax Act, No. 15 of 2019, and the Climate Change Act, No. 22 of 2024. T

256. The Climate Change Act provides that the Minister must list categories of GHGs and activities that emit such GHGs (section 26). Listed emitters will be assigned a carbon budget in terms of section 27 of the Act. The carbon budgets so

assigned will correspond to the "sectoral emissions targets" determined in terms of section 25. Sectoral emissions targets will in turn be aligned to "the national greenhouse gas emissions trajectory" set in terms of section 24. The national greenhouse gas emissions trajectory is a greenhouse gas emissions reduction objective specified by the Minister in conformity with South Africa's international obligations and the principles and objectives of the Climate Change Act.

257. The Carbon Tax Act provides for a tax levied on GHG emissions and sets out the mechanisms for the calculation of this tax.

258. To illustrate the relevance of these considerations, I refer to the expert evidence of Mark New that will be filed together with this affidavit, which confirms that in the light of leading climate science there is international consensus that no new oil and gas fields should be developed if the world is to achieve the 1.5°C target set by the Paris agreement.

259. To summarize his findings,

259.1. Climate change is already having very significant negative impacts on people and ecosystems throughout the world, including in South Africa. The significance of the Paris Agreement target of 1.5°C above pre-industrial levels is that it reflects a global consensus that the level of risk to humanity becomes unacceptably high once that threshold is crossed

T108

259.2. Climate change is having, and will continue to have, disproportionately severe impacts on South Africa, and on poor and marginalised communities, women, children and future generations.

259.3. The IPCC states, "Risks and projected adverse impacts and related losses and damages from climate change will escalate with every increment of global warming (very high confidence). They are higher for global warming of 1.5°C than at present, and even higher at 2°C (high confidence).".

259.4. Based on a review of selected climate and energy scenarios by intergovernmental organizations, including the IPCC, International Renewable Energy Agency (IRENA), and the International Energy Agency (IEA), the International Institute for Sustainable Development (IISD) noted a consensus that no new oil and gas fields should be developed if the world is to achieve the 1.5°C target.

259.5. In order for there to be a 50% likelihood of limiting warming to 1.5°C, the Remaining Carbon Budget, set in 2022, is shrinking fast due to ongoing annual emissions, and the window of opportunity within which humanity can take measures to avoid overshooting the 1.5°C and 2.0°C thresholds for dangerous, and perhaps catastrophic, climate change, is closing fast..

259.6. Similarly, in 2021, the International Energy Agency declared that "there is no need for investment in new fossil fuel supply" in its scenario for achieving net zero emissions by 2050—a finding it reiterated again in 2023.

259.7. The likelihood of reaching a climate tipping point increases in the Paris agreement range of 1.5 to < 2°C warming. It is virtually certain that the world will overshoot 1.5 °C within the next few years and enter a zone of very significant risk.

259.8. Climate change is having, and will continue to have, disproportionately severe impacts on South Africa, and on poor and marginalised communities, women, children and future generations.

259.9. If a deep water gas field were to be developed, it is reasonable to assume it would not start producing gas until about 2035. Extremely steep reductions in emissions will be necessary well before this date to meet the goal of net-zero emissions by 2050, meaning that it is extremely unlikely that the field could operate and be consistent with South Africa's 2050 net-zero commitment.

259.10. The magnitude of natural gas production on GHG warming depends strongly on the level of fugitive emissions (gas that escape into the atmosphere during production and transport and is therefore not burnt for energy production). In many cases, the net GHG effect of natural

gas use is greater than that of oil or coal, because of these fugitive emissions.

259.11. The argument that natural gas is a lower impact "transition fuel" that should be exploited in place of oil and gas is untrue in most gas production cases to date.

260. A further consideration, as discussed below, is that South Africa is particularly vulnerable to the adverse effects of climate change at present levels of warming - warming above 1.5°C could be devastating for South Africa.

261. To summarize, climate change law and policy considerations that are relevant to need and desirability and that should have been reported on and assessed in the BAR are that:

261.1. natural gas production in the Project area has the potential to generate significant quantities of GHGs;

261.2. this would have significant implications for global warming, climate change and South Africa's international commitments in terms under the Paris agreement; and

261.3. no new oil and gas fields should be developed if the world is to achieve the 1.5°C target set by the Paris accord.

The broader context of the project

262. The extent of the exploration and production activity in South Africa's exclusive economic zone (EEZ) is relevant in so far as it has a bearing on the question of need and desirability and cumulative impact, as will shortly become clear.

263. I attach hereto as Annexure A15, a hub map provided by the Petroleum Agency of South Africa ("PASA") showing these operations. As can be seen from this image, a large amount of the ocean acreage comprising South Africa's exclusive economic zone is subject to an exploration right.

264. Although there is very little publicly available information about the magnitude of the oil and/or gas reserves thought to be located in this area, the Phakisa report gives some indication.

265. Operation Phakisa was an initiative of the Presidency. Its purpose is explained on the dedicated Operation Phakisa website (www.operationphakisa.gov.za) as being to *"fast track the implementation of development solutions on critical development issues."* Phakisa literally means "hurry up" in Sesotho. According to the website, the "methodology" for the process was the following:

> *"The methodology consists of eight sequential steps. It focusses on bringing key stakeholders from the public and private sectors, academia*

as well as civil society organisations together to collaborate in detailed problem analysis, priority setting, intervention planning and delivery. These collaboration sessions are called laboratories (labs). The results of the labs are detailed (3 foot) plans with ambitious targets as well as public commitment on the implementation of the plans by all stakeholders."

266. One such lab was designated "Offshore Oil and Gas exploration". I will refer to it simply as "the lab".

267. The Presidency has released a report recording the outcomes of the lab entitled "*Unlocking the economic potential of South Africa's oceans*" ("the Phakisa report"). A copy of the Phakisa report is attached marked Annexure "A16".

268. As appears from page 1 of the Phakisa report, the theoretical target that this lab sought to "unlock" was 30 exploration wells in ten years. The following statement appears at page 10 of the report:

> "*South Africa has possible in-place resources of ~9 bn barrels of oil and ~60 Tcf of gas offshore, but uncertainty is high.*"

269. It is clear from the Phakisa report that reconnaissance activities are an inseparable part of a broader strategy to produce oil and gas.

The relationship between reconnaissance, exploration and production

270. The relationship between the reconnaissance, exploration and production phases of a petroleum project is relevant because the EAP and the decision-makers declined to engage with any material or concerns related to exploration and production on the project area on the basis that reconnaissance, exploration and production are separate and unrelated activities.

271. While it is so that a distinct environmental authorisation is required for the activities related to a reconnaissance permit, an exploration right and a production right, these phases are not separate and unrelated undertakings, as I have explained above.

272. While the discussion of the need for the Project in the BAR (at pg 33) mentions that natural gas serves as a transition fuel on the path to the carbon-neutral goal and assist in reducing carbon emissions from coal for electricity generation, and that South Africa does not currently have enough gas resources, it states that from a climate change perspective it is "not currently possible to accurately assess" the risks associated with oil and gas activities.

273. In doing so, the BAR implies that the assessment of the negative impacts and

risks associated with oil and gas activities is a relevant consideration. However, it declines to assess the negative impacts and risks on the grounds of impossibility by focussing on the need for accuracy with regard to the precise details of production.

274. On the basis of alleged impossibility, the BAR concludes, illogically, that exploration and production activities are separate and unrelated to reconnaissance.

275. I shall show below that a rational evaluation of "need and desirability" is indeed possible.

276. The decision-makers uncritically accepted the BAR's conclusion that reconnaissance activities are unrelated to exploration and production.

277. The DG's conclusion as to need and desirability was expressed in a single paragraph 3.4 of the Reasons for Decision:

> *"The motivation for the need and desirability of the proposed 3D seismic survey activity is in line with the requirements of the EIA Regulations, 2014 and addresses key issues in the Need and Desirability Guideline."*

JNOS

278. The Minister's evaluation of need and desirability is given at paragraphs 2.21.2 to 2.21.4 of her appeal decision:

> *"2.21.2. I note that some of the concerns raised by the Appellants extend beyond the proposed project activity in respect of which the EA was granted. I confirm that any activity beyond the EA will be subject to a separate application and a separate assessment process. Accordingly, it is not relevant and therefore not necessary to consider submissions in respect of activities that fall outside the EA for the purposes of this appeal.*
>
> *2.21.3. I have considered the needs and desirability of the Project. The BAR on page 21-33 thereof addresses the needs and desirability of the Project and further covers the context of the oil and gas industry, applicable policies and planning frameworks (local, national, and international) and broadly societal needs and public interest. I note that the Project is in alignment with government policies and plans such as the Integrated Resources Plan 2019 (IRP) which recognises the need for South Africa to employ a diversified energy mix to meet the country's electricity requirements. I have furthermore considered the Guideline on Need and Desirability as well as the No- Go alternative which is also addressed on page 36 of the final BAR.*
>
> *2.21.4. I am therefore satisfied that the criteria for the need and*

desirability for the Project has been demonstrated by the Applicant, in particular that the Project accords with legislative requirements and government policies and plans, including the IRP, the National Development Plan (NDP) and the draft Marine Spatial Planning Sector Plans which includes a Marine Offshore Oil and Gas Sector Plan (the Draft MS Plan). The IRP and the Integrated Energy Plan (IEP) recognise natural gas as a required source to produce electricity and direct thermal energy. Its role to contribute to maintaining base-load electricity and peak-load electricity is acknowledged, and it is also recognised as a way to transition South Africa towards a lower carbon economy providing the flexibility required to complement renewable energy sources and as a lower carbon option compared to coal." (The relevance of the parts I have emphasised will become clear shortly.)

A rational evaluation of "need and desirability"

279. It is clear from the treatment of "need and desirability" in both the BAR and the decisions, in particular the appeal decision, that the "desirability" of acquiring a reconnaissance permit, and any subsequent exploring and producing petroleum in the project area, is considered to relate primarily to the prospect that gas will be found and produced. The reason for this appears to be that gas is considered to be a "transition fuel" that will aid in transitioning the energy system, specifically the electricity system, away from a coal and therefore help to reduce GHG emissions.

280. This being the case, the EIA should have been approached on the basis that the ultimate purpose of the reconnaissance activities was production of gas. Had this occurred the EAP and the decision-makers would have found it necessary to consider the specifics of the proposal to address South Africa's gas utilisation by means of gas extracted offshore.

281. Had they done so, they would have brought to light the considerations referred to above, including those contained in the expert evidence of Mark New in his affidavit.

282. Also relevant are the key findings in the article by New and Meckle dated October 2024 attached to Mark New's affidavit, which include the following:

282.1. Information on GHG emissions from exploitation of future, yet to discovered, oil and gas reserves in South Africa can (and should) be used in support of development of the country's Nationally Determined Contribution for reducing greenhouse gas emissions, as required by the Paris Agreement of the UNFCCC.

282.2. Estimation of yet to be discovered, commercially viable, oil and gas reserves for South Africa are possible, using well established methodologies. These estimates carry large uncertainties, but can usefully be applied to determine likely upper and lower limits for these resources.

282.3. Well established emission factors, which determine the CO_2-equivalent greenhouse gas emissions from use of oil and gas for different purposes, can be used to calculate the emissions that would be emitted from exploitation and use of yet to be discovered oil and gas reserves.

TDS

283. In addition, the assumption of the desirability of the production of gas in the BAR failed to take into account potential negative social and economic considerations. In this regard I refer to the expert affidavit of Gillian Hamilton, which will be filed together with this affidavit. In her affidavit, Hamilton summarizes her opinion as follows:

283.1. The disparity between the narratives of African leaders and the realities faced by communities in sacrifice zones (a sacrifice zone refers to a geographic area that has been permanently impaired by environmental damage or economic disinvestment) illustrates a fundamental misunderstanding of the adverse effects fossil fuel investments can have on local economies.

283.2. Research shows that establishing an offshore oil and gas industry within South Africa is unlikely to yield significant economic benefits. Instead, it may exacerbate existing challenges. Past experiences across Sub-Saharan Africa indicate that actual benefits often fall short of forecasts.

283.3. With an accelerated global energy transition through increased shifts towards renewable energy and increasing climate mitigation commitments, the risks associated with oil and gas developments are profound. The financial, environmental, and social repercussions may well outweigh any anticipated economic gains in the form of increased levels of sovereign debt or lower credit ratings.

JR03

283.4. It is imperative for South Africa to adopt a sustainable and renewable energy-focused economic approach, acknowledging the importance of protecting the socio-economic well-being of its citizens and environment.

284. All of these relevant factors would have had to be considered in determining whether a gas-predominant energy sector is desirable, and weighted against the ecological impact of the project.

285. I do not suggest that the assessment should have been exhaustive of all exploration and production phase impacts, obviously specific impacts would be determined by reference to the precise form and location of any exploration and production operations ultimately established. These matters are appropriately postponed to the later process to obtain EA for exploration and production activities. Rather, my contention is that the general ecological impact associated with exploration and production activities should have been assessed during this EIA process.

286. Importantly, this assessment would have included the cumulative ecological impact of such exploration and production activities, taken together with other reconnaissance, exploration and production activities that are proposed across South Africa's exclusive economic zone, as required by item 3(3)(j) of appendix 3 to the EIA Regulations.

287. While a general assessment of the impacts of exploration and production still leaves gaps in knowledge, it would be sufficient for the purposes of a consistent assessment of need and desirability.

288. All of the above considerations were omitted from the assessment in the BAR.

Part of the Project area already surveyed

289. A part of the Project area was surveyed by Searcher Geodata UK Limited "Searcher" in the first part of 2024, reducing the need to survey the whole Project area.

290. The relevant information I have access to in this regard is that:

290.1. Searcher conducted, but was unable to complete, a 3D seismic survey in 2024 for the area of 7863 km² represented on the map annexed and marked **A17**.

290.2. the area in A17 falls wholly within the Project area, as can be seen from the map showing that area overlaid on a map of the Project area, annexure **A18**.

290.3. The Searcher survey received an EA on 20 December 2022 (ref: 12/1/043) which was appealed against. I attach marked **A19** an extract from the EA.

JMS

290.4. The appeals against the Searcher survey EA were dismissed on 23 September 2023 by the Minister, nine months before the Minister's decision in this matter. I attach marked **A20** an extract from the appeal decision.

290.5. The Searcher survey was commenced between January and April 2024 but was not fully completed and Searcher has applied for a new permit to complete it for the same activity over the same area. This has been disclosed in information sent to IAPs.

291. I do not know how much of the area was surveyed in the uncompleted seismic survey process by Searcher.

292. I do not anticipate that the above facts will be disputed since they appear in documents in the public domain, but I reserve the right to introduce them should that become necessary.

293. It stands to reason that the need for data in respect of the Project area no longer exists to the extent that such data has already been obtained by seismic survey.

294. It also calls into question the need for authorising multiple seismic survey activities for the same area, which is implicit in the assumption in the BAR that there may be three surveys, Searcher, TGS and GX Technologies occurring in

AT.28

the same survey window period. (BAR pg 211.) The need for multiple surveys in the same area is not explained in the BAR or by the decision-makers.

295. The Minister failed to consider this information or cause it to be integrated into the assessment of need and desirability in the BAR.

Conclusion on need and desirability

296. In the light of "need and desirability" properly construed, there were critical failures in the BAR and by the decision-makers to assess need and desirability rationally and to consider all relevant considerations, in that:

296.1. The approach adopted was fundamentally inconsistent and irrational;

296.2. A consistent approach requires that either both the costs and benefits of the production of natural gas be taken into consideration, or that such production should not be taken into consideration;

296.3. The negative impacts of production of natural gas outweigh the benefits thereof when one considers the relevant climate change law and policy, the broader context of the project, the relationship between reconnaissance, exploration and production, and a rational evaluation of "need and desirability";

296.4. The alternative of not proceeding with the Project was not properly

FC28

assessed; and

296.5. The Minister failed to take into consideration that part of the Project area had already been surveyed when she took her decision.

297. The third ground of review is that the BAR failed to conduct a rational assessment of need and desirability in that the BAR:

297.1. considered only the potential positive impacts of the production of oil and gas for the purposes of determining need and desirability and not the potential negative impacts thereof, which was inconsistent and irrational, in breach of sections 2(b) and 3(1)(f) of Appendix 1 to the EIA Regulations read with Regulation 18 thereof;

297.2. failed to conduct a proper assessment of the option of not implementing the activity, in breach of section 24(4)(b)(i) of NEMA read with the EIA Regulations; and

297.3. failed to conduct an assessment of the potential social, economic and environmental impacts of the exploration and production of oil and gas, in breach of 24(4)(b)(i) of NEMA read with the EIA Regulations,

with the result that the EA and the Minister's decision to uphold it are reviewable on one or more of the following PAJA review grounds:

297.3.1. a mandatory and material procedure or condition prescribed by an empowering provision was not complied with, as

JA28

contemplated in section 6(2)(b) of PAJA;

297.3.2. relevant considerations were not considered, as contemplated in section 6(2)(e)(iii) of PAJA;

297.3.3. the action was procedurally unfair, as contemplated in section 6(2)(c) of PAJA;

297.3.4. the EA and appeal decision contravened a law and were not authorised by the empowering provision, as contemplated in section 6(2)(f)(i) of PAJA); and

297.3.5. the EA and the Minister's decision are not rationally connected to the information before them, as contemplated in section 6(2)(f)(ii)(cc) of PAJA.

298. Alternatively, the EA and appeal decision are reviewable in terms of the constitutional principle of legality.

Fourth Ground of Review – Risks not assessed

299. The fourth ground of review is that conditions of authorisation in the EA required the submission of further plans by the developer to the Competent Authority for approval without the impacts, risks and mitigation measures related thereto

51.23

having been identified, reported on or assessed on the BAR or included in the EMPr, or such plans having been subjected to public participation in the EIA process.

300. The EA, in paragraphs 5.5.6 and 5.5.7 on p 11, imposes two conditions of approval requiring the holder to submit two further plans for approval as follows:

> *"5.5.6 The holder must submit a Shipboard Oil Pollution Emergency Plan (SOPEP) in accordance with MARPOL 73/78 Annex I and the National Oil Spill Contingency Plan (NOSCP).*
>
> *5.5.7 In addition to SOPEP, Emergency Response and Medical Evacuation Plan must be submitted. The said plans must take into consideration all resources that may be required in case of an oil spill incident or any emergency incident. The plans must be submitted to the Petroleum Agency SA (hereafter referred to as the 'Agency') thirty (30) days before the mobilisation of the seismic survey vessel."*

301. The need for these conditions of approval indicates that the DG formed the view that the authorised activity carries risks of an oil spill emergency or other emergency incident, some of which could require emergency evacuation.

302. Section 3(1)(h) of Appendix 1 to the EIA regulations requires a BAR to include, among others, a description of the impacts and risks identified and how they can be managed, avoided or mitigated.

JC28

303. The BAR failed to identify and include in the description of impacts and risks, the risks of an oil spill emergency or other emergency incident, some of which could require emergency evacuation, and did not propose the mitigations contained in the aforementioned paragraphs 5.5.6 and 5.5.7 of the EA. This constituted a breach of section 3(1)(h) of Appendix 1 to the EIA regulations.

304. Section 1(1)(d) of Appendix 4 to the EIA regulations requires an EMPr to include, among others *"a description of the impact management outcomes, including management statements, identifying the impacts and risks that need to be avoided managed and mitigated as identified through the EIA process."*

305. The EMPr did not include the mitigation and management measures contained in the aforementioned paragraphs 5.5.6 and 5.5.7 of the EA. This constituted a breach of section 1(1)(d) of Appendix 4 to the EIA regulations, which requires the EMPr to describe the impact management outcomes, including management statements, identifying the impacts and risks that need to be avoided, managed and mitigated as identified through the environmental impact assessment process for all phases of the development. This constituted a breach of section 1(1)(d) of Appendix 4 to the EIA regulations.

306. No public participation was conducted in respect of the aforementioned risks of an oil spill emergency or other emergency incident, some of which could require emergency evacuation, or with a Shipboard Oil Pollution Emergency Plan or the Emergency Response and Medical Evacuation Plan contemplated in

paragraphs 5.5.6 and 5.5.7 respectively of the EA. This constituted a breach of Regulations 40 and 41 of the EIA Regulations read with section 2 of NEMA and the rights of IAPs in respect of *audi alteram partem*.

307. The fourth ground of review is that conditions of authorisation in the EA required the submission of further plans to the Competent Authority for approval without any public participation in regard thereto, in breach of section 3(1)(h) of Appendix 1 and section 1(1)(d) of Appendix 4 to the EIA regulations, Regulations 40 and 41 to the EIA regulations, and of the rights of IAPs in respect of *audi alteram partem*, with the result that the EA and the appeal decisions are reviewable on one or more of the following PAJA review grounds:

307.1. a mandatory and material procedure or condition prescribed by an empowering provision was not complied with, as contemplated in section 6(2)(b) of PAJA;

307.2. the action was procedurally unfair, as contemplated in section 6(2)(c) of PAJA;

307.3. the EA and appeal decision contravened a law and were not authorised by the empowering provision (section 6(2)(f)(i) of PAJA); and

307.4. the EA and the Minister's decision are not rationally connected to the purpose of the empowering provision, as contemplated in section

JR.38

6(2)(f)(ii)(bb) of PAJA.

308. Alternatively, the EA and appeal decision are reviewable in terms of the constitutional principle of legality.

Fifth Ground of Review – The ICMA

309. The fifth ground of review is that the BAR failed, with respect to the Integrated Coastal Management Act, No. 24 of 2008 ("the ICMA"), to determine the policy and legislative context within which the proposed activity is located and how the activity complies with and responds to the policy and legislative context, or to contain the information that is necessary for the Competent Authority to consider and come to a decision on the application.

310. The ICMA falls within the definition of "*specific environmental management Act*" in section 1 of NEMA. Section 24(4)(b)(vii) of NEMA requires EIA procedures to include "*provision for the adherence to requirements that are prescribed in a specific environmental management Act relevant to the listed or specified activity in question*".

311. The objectives of the BAR process include, in terms of section 2(1)(a) of Appendix 1 to the EIA Regulations, to

"*determine the policy and legislative context within which the proposed*

activity is located and how the activity complies with and responds to the policy and legislative context;"

312. Section 3(1) of Appendix 1 requires a BAR to contain the information that is necessary for the Competent Authority to consider and come to a decision on the application.

313. Certain provisions of the ICMA are specifically relevant to decisions regarding EAs, and therefore form part of the applicable legal context. As such, the BAR was required to determine how the Project responds to the relevant provisions of the ICMA.

314. The ICMA regulates environmental authorisations for "coastal activities" and applies to South Africa's territorial waters and the Exclusive Economic Zone (EEZ).

315. Section 63(1) thereof requires a Competent Authority to take account of specific factors when deciding whether or not to grant an Environmental Authorisation for "coastal activities".

316. The Project is to take place in South Africa's EEZ. Therefore, it falls within the coastal zone and is a coastal activity regulated by the ICMA. As such, the decisions under review were obliged to take into account the factors listed in section 63 of the ICMA, in addition to the requirements of NEMA and the EIA Regulations. These factors include:

316.1. whether coastal public property will be affected by the activity and, if so, the extent to which the proposed development or activity is consistent with the purpose of establishing and protecting these areas; (Section 63(1)(c))

316.2. if the activity affects coastal public property, whether it is inconsistent with the objective of conserving and enhancing coastal public property for the benefit of current and future generations; (Section 63(1)(h)(i))

316.3. whether the activity would be contrary to "the interests of the whole community"; (Section 63(1)(h)(vii)) and

316.4. the objects of the ICMA. (Section 63(1)(k))

317. Broadly, the above provisions require the Competent Authority to give specific consideration to the compatibility of a proposed activity with the framework of principles and objectives established by the ICMA.

318. The following provisions of the ICMA are of particular relevance:

318.1. Coastal public property is vested in the citizens of the Republic and is held in trust and managed on their behalf by the State. (Section 11)

318.2. In performing this function, the State is under a duty to ensure that

coastal public property is managed, conserved and enhanced in "the interests of the community as a whole and to take whatever reasonable legislative and other measures it considers necessary to conserve and protect coastal public property for the benefit of present and future generations. (Section 12)

319. The ICMA is explicit in addressing how the public interest must be construed for purposes of the Act. The term "the interests of the community as a whole" is defined in section 1 to mean:

> *"the collective interests of the community determined by-*
>
> *(a) prioritising the collective interests in coastal public property of all persons living in the Republic over the interests of a particular group or sector of society;*
>
> *(b) adopting a long-term perspective that takes into account the interests of future generations in inheriting coastal public property and a coastal environment characterised by healthy and productive ecosystems and economic activities that are ecologically and socially sustainable; and*
>
> *(c) taking into account the interests of other living organisms that are dependent on the coastal environment".*

320. Thus, the ICMA seeks to ensure the protection of coastal resources and the coastal environment as a public good and to this end: first, gives particular prominence to the collective public interest and the interests of other living organisms that are dependent on the coastal environment, and second,

imposes specific duties on the State.

321. In order to comply with section 63 of the ICMA, the BAR would, at minimum, have had to consider –

321.1. whether the proposed project would affect coastal public property;

321.2. whether the proposed project is consistent with the objective of conserving, protecting and enhancing coastal public property for the benefit of current and future generations;

321.3. whether the proposed project would substantially prejudice any coastal management objective;

321.4. whether the proposed project is socially and economically justifiable and ecologically sustainable and consistent with section 24 of the Constitution regarding the interests of future generations in inheriting coastal public property and a coastal environment characterised by healthy and productive ecosystems and economic activities that are ecologically and socially sustainable;

321.5. whether the proposed project is in the interests of other living organisms that are dependent on the coastal environment;

321.6. whether granting an environmental authorisation for the proposed project is consistent with the duties of the decision-maker to conserve and protect coastal public property for the benefit of present and future generations and to ensure that it is used, managed, protected, conserved and enhanced in the interests of the whole community.

322. The BAR did none of this. Its only reference to the ICMA was its inclusion, in Table 5 on page 16, in a list of additional legislation that may be applicable. Next to the name of the ICMA, the BAR states the following:

> *"This Act supports the authorisation requirements of NEMA but specifies additional criteria for regulating activities or developments (Section 63) and provides for pollution control within the coastal zone (Sections 69 to 73), where the coastal zone includes the Exclusive Economic Zone defined in the Maritime Zone Act."*

323. Section 12 of the ICMA provides that the State, in its capacity as the public trustee of all coastal public property, must ensure that coastal public property is used, managed, protected, conserved and enhanced in the interests of the whole community.

324. The BAR fails to mention the requirements of section 12 or section 63, makes no mention of coastal public property, or the state being the public trustee thereof, or the objects, criteria and other considerations I have mentioned above.

325. The fifth ground of review is that the BAR failed, with respect to the ICMA, to determine the policy and legislative context within which the proposed activity is located and how the activity complies with and responds to the policy and legislative context, or to contain the information that is necessary for the Competent Authority to consider and come to a decision on the application, as contemplated in sections 2(1)(a) and 3(1) of Appendix 1 of the EIA Regulations, read with sections 12 and 63 of the ICMA. The EA and the Minister's decision to uphold it are accordingly reviewable on one or more of the following PAJA review grounds:

325.1. a mandatory and material procedure or condition prescribed by an empowering provision was not complied with, as contemplated in section 6(2)(b) of PAJA; and

325.2. relevant considerations were not considered, as contemplated in section 6(2)(e)(iii) of PAJA;

326. Alternatively, the EA and appeal decision are reviewable in terms of the constitutional principle of legality.

Sixth Ground of Review – Defective EMPr

327. The sixth ground of review is that the environmental management programme

("EMPr") is materially deficient and fails adequately to set out impacts and risks that need to be avoided, managed and mitigated, or to provide an identification of the manner in which the impact management outcomes will be achieved; the method of monitoring the implementation of the impact management actions; and the mechanism for monitoring compliance with the impact management actions.

328. This ground of review illustrates the scant regard that was had to the social impacts on the community when it comes to redressing them in any meaningful way.

329. The EMPr, Annexure A9, was approved in para 5.4.1 of the EA, attached as A2 hereto.

330. In terms of section 1(1) of Appendix 4 to the EIA Regulations, the EMPr must include, *inter alia*:

> *(d) a description of the impact management outcomes, including management statements, identifying the impacts and risks that need to be avoided, managed and mitigated as identified through the environmental impact assessment process for all phases of the development including—*
>
> *(i) planning and design;*
>
> *(ii) preconstruction activities;*
>
> *(iii) construction activities;*

(iv) rehabilitation of the environment after construction and in the case of a closure activity, closure; and

(v) where relevant, operation activities;

(e) . . . . . .

"(f) a description of proposed impact management actions, identifying the manner in which the impact management outcomes contemplated in paragraph (d) will be achieved, ...

(g) the method of monitoring the implementation of the impact management actions contemplated in paragraph (f);

(h) the frequency of monitoring the implementation of the impact management actions contemplated in paragraph (f);

(i) an indication of the persons who will be responsible for the implementation of the impact management actions;

(j) the time periods within which the impact management actions contemplated in paragraph (f) must be implemented;

(k) the mechanism for monitoring compliance with the impact management actions contemplated in paragraph (f); . . ."

331. While the EMPr included mitigation measures recommended in the SIA in paragraph 13.7 of Table 5 of the EMPr, attached hereto as Annexure A21, it failed to comply with paragraphs (f), (g) and (k) of section 1(1) of Appendix 4 to the EIA Regulations.

332. Table 5 fails to comply with section 1(1) of Appendix 4 in material respects in that it omits certain critical requirements.

333. The EMPr in Table 5 avoids using terms used in Appendix 4 to the EIA Regulations, such as "risks that need to be avoided, managed and mitigated" in (d), "impact management outcomes" in (f), "impact management actions" in (f) – (k), and "the mechanism for monitoring compliance" in (k). Instead it uses vague terms such as "technical or management option", "target" and "performance indicators (monitoring tool)", making it difficult to identify which subparagraph of the regulation it purports to comply with.

334. As a result, regardless of the terminology, key elements are missing from Table 5. For example, in para 13.7 of the EMPr on pp 29 and 30, (Annexure A9 hereto), mitigation measures recommended by the SIA, (mentioned above in the second ground of review), are repeated in the first column, under the heading "Technical or Management Option". One of these, D, reads as follows:

> *"A representative from TGS should consult with the traditional leadership of the affected communities to establish what their understanding of meaningful consultation is and how communities should be consulted in future. This will assist with readjusting the relationship between TGS and the traditional communities It will also cause significant delays in the application process. Given the current socio-political conditions in the coastal communities following prescribed legal processes is not sufficient to be seen as meaningful consultation from a community perspective."*

335. One would expect to find opposite this in Table 5, the impacts and risks that need to be avoided, managed and mitigated in order to achieve this management outcome, as required by section 1(d) of Appendix 4 to the EIA Regulations. In numerous instances these are omitted, rendering it impossible to determine the appropriate mitigation and management objective.

336. I point out, in the example quoted above, that the following words contained in the SIA recommended mitigation are omitted from the EMPr: "*This is an explicit request from community members and failing to do so will increase the reputational risk for TGS and weakens their social licence to operate further. It will also cause significant delays in the application process.*" These words describe the impacts and risks that need to be avoided, managed and mitigated, but the words do not appear in the EMPr.

337. Other similar examples relate to other mitigation measures recommended by the SIA in para 13.7 A to E of the EMPr on pp 29 and 30 (Appendix A20), where the EMPr fails to provide, or distinguish between, the specific impact management outcomes, impact management actions, and the mechanism for monitoring compliance in respect of the impacts and risks that need to be avoided, managed and mitigated required by Appendix 4. I summarise them as follows:

337.1. In paragraph A, the EMPr indicates that TGS is required to consult with the communities to develop a community engagement protocol that is based on the San Code of Research Ethics, including a communication

DCJ8

strategy and grievance mechanism.

337.2. In paragraph B, the EMPr indicates that TGS should contribute to assisting with collaboration on independent research on how fish species on the West Coast respond to seismic surveys on the marine ecosystem.

337.3. In paragraph C, the EMPr states that TGS should consult with communities on potential ways in which to make a positive contribution to the communities and investigate opportunities for the employment of people from local communities and skills development.

337.4. In paragraph D, the EMPr indicates that a representative from TGS should consult with the traditional leadership of the affected communities to establish what their understanding of meaningful consultation is and how communities should be consulted in future.

337.5. Also in paragraph D, the EMPr indicates that TGS should initiate discussions in their industry, which should reassess its position and social licence to operate as an industry in a South African context and conduct a strategic environmental assessment of the impact of the industry and embark on an awareness raising and education campaign.

337.6. In paragraph E, the EMPr states that TGS should approach the authorities and enter into conversation regarding a strategic impact assessment for the area that should be contributed to by all the

production/ exploration companies involved.

338. One would expect to find in Table 1 of the EMPr, if there was any serious intention to attain the objectives of the recommendations regarding mitigation made in the SIA, an identification of the manner in which the impact management outcomes will be achieved, the method of monitoring the implementation of the impact management actions, and the mechanism for monitoring compliance with the impact management actions.

339. What one finds instead is simply, under 'Target': *"ensure that socio-economic considerations are considered and implemented where necessary"*, and under "Performance Indicators (Monitoring Tool)": *"Consultation register and workshops (ECO Monthly audit)"* or words to that effect.

340. I have discussed elsewhere in this affidavit why these mitigation measures were imposed and the dire social conditions they were intended to mitigate as a precondition for the seismic survey. The scant attention they receive in the EMPr is a slap in the face for the communities concerned and is unlikely to engender the trust necessary in order to facilitate genuine consultation.

341. As a result, the EMPr fails to comply with sections 1(1)(f), (g) and (k) of Appendix 4 to the EIA Regulations.

342. The sixth ground of review is that the EMPr is materially deficient and fails adequately to set out the impacts and risks that need to be avoided, managed

DCJS

and mitigated, or to provide an identification of the manner in which the impact management outcomes will be achieved, the method of monitoring the implementation of the impact management actions, and the mechanism for monitoring compliance with the impact management actions, as required by sections 1(1)(f), (g) and (k) of Appendix 4 to the EIA Regulations, which constitutes a breach of Regulation 19(4) of the EIA Regulations read with s 24N(2) of NEMA. As a result, the EA and the Minister's decision to uphold it are reviewable on one or more of the following PAJA review grounds:

342.1. a mandatory and material procedure or condition prescribed by an empowering provision was not complied with, as contemplated in section 6(2)(b) of PAJA;

342.2. relevant considerations were not considered, as contemplated in section 6(2)(e)(iii) of PAJA;

342.3. the EA and appeal decision contravened a law and were not authorised by the empowering provision, as contemplated in section 6(2)(f)(i) of PAJA); and

342.4. the EA and the Minister's decision are not rationally connected to the information before them, as contemplated in section 6(2)(f)(ii)(cc) of PAJA.

343. Alternatively, the EA and appeal decision are reviewable in terms of the

TC 25

constitutional principle of legality.

Seventh Ground of Review – No Locality Plan

344. The seventh ground of review is that the EA failed to contain a plan which locates the proposed activity or activities authorised at an appropriate scale as required by the EIA Regulations.

345. Regulation 25 provides for the issue of an EA. Regulation 26 stipulates what an EA must contain, and Regulation 26(c) states that the EA must specify, among others,

> *"a description of the location of the activity, including- ...*
>
> *(iv) a plan which locates the proposed activity or activities authorised at an appropriate scale, or, if it is - ...*
>
> *(aa) a linear activity, a description and coordinates of the approved corridor of the activity or activities; ..."*

346. The EA, in Table 1 on p 8 of A2, authorised an area for the seismic survey represented by nine GPS coordinates but did not contain any plan which locates the proposed activity or activities authorised at an appropriate scale.

347. By way of contrast, the EA for the Searcher survey referred to above, does contain such a plan, as can be seen from annexure A19.

JWS

348. The seismic blasting reconnaissance activity is not a linear activity and therefore the exception to regulation 26(c) does not apply. The EIA Regulations define a "linear activity" as meaning "*an activity that is arranged in or extending along one or more properties and which affects the environment or any aspect of the environment along the course of the activity, and includes railways, roads, canals, channels funiculars pipelines, conveyor belts, cableways, power lines, fences, runways, aircraft landing strips, firebreaks and telecommunication lines*".

349. In any event, the coordinates of the Project area in the locality plan in the BAR, which appear in the locality plan in Figure 1 of the BAR (on pg 9 of A4), and which is the plan that was used by the specialists, are represented by 15 GPS coordinates, none of which are the same as the coordinates of the authorised area.

350. The nine co-ordinates in the EA appear to be taken from pg 1 of the BAR, which describes them as "the Application Area corner coordinate points". However, they are not the same as the coordinates in the locality plan in Figure 1 of the BAR. They are also not all corner coordinates.

351. While eight of the nine coordinates are relatively near to the coordinates in Figure 1, one is materially different, as can be seen from annexure A22, which is a copy of a Google Earth map on which the polygon represented by the approved nine coordinates (in red) is superimposed on the polygon

JCOS

representing the fifteen coordinates in Figure 1 (in blue). As can be seen, a large triangle of area on the northern side depicts the difference between the approved area and the area in Figure 1.

352. The seventh ground of review is that the EA failed to contain a plan which locates the proposed activity or activities authorised at an appropriate scale, in breach of Regulation 26(c) of the EIA Regulations, with the result that the EA and the Minister's decision to uphold it are reviewable on one or more of the following PAJA review grounds:

352.1. a mandatory and material procedure or condition prescribed by an empowering provision was not complied with, as contemplated in section 6(2)(b) of PAJA;

352.2. relevant considerations were not considered, as contemplated in section 6(2)(e)(iii) of PAJA;

352.3. the EA and appeal decision contravened a law and were not authorised by the empowering provision, as contemplated in section 6(2)(f)(i) of PAJA); and

352.4. the EA and the Minister's decision are not rationally connected to the information before them, as contemplated in section 6(2)(f)(ii)(cc) of PAJA.

FIDS

353. Alternatively, the EA and appeal decision are reviewable in terms of the constitutional principle of legality.

The eighth ground of review - Cumulative impacts

354. The eighth ground of review is that the BAR failed adequately to assess the cumulative impacts and risks of seismic blasting.

355. Section 2(d) of Appendix 1 to the EIA Regulations states that the objective of the BA process includes the undertaking of an impact and risk assessment process, inclusive of cumulative impacts, to determine the nature, significance, consequence, extent, duration and probability of the impacts occurring.

356. Section 3(1)(j)(i) of Appendix 1 to the EIA Regulations requires a BA report to contain an assessment of each identified potentially significant impact and risk, including cumulative impacts, and, in section 3(1)(o), a description of any assumptions, uncertainties, and gaps in knowledge which relate to the assessment and mitigation measures proposed.

357. For ease of reference, I set out below the definition of a cumulative impact, as described in the EIA Regulations:

> *"cumulative impact", in relation to an activity, means the past, current and reasonably foreseeable future impact of an activity, considered*

SCS

together with the impact of activities associated with that activity, that in itself may not be significant, but may become significant when added to the existing and reasonably foreseeable impacts eventuating from similar or diverse activities;

358. In particular, I note that cumulative impacts associated with both similar and diverse activities are required to be considered.

359. In addition, I shall briefly summarise the cumulative impacts related to the following:

359.1. other seismic surveys in or near the project area;

359.2. other exploration and production projects in or near the project area; and

359.3. cumulative climate impacts from exploitation of oil and gas resources.

Cumulative impacts of other seismic surveys

360. The BAR considers cumulative impacts in section 9.3.1.4 (page 209ff). It considers the possibility of up to three seismic surveys happening over the same area in the same seismic window, but does not consider the potential impacts of other oil and gas development activities in or near the project area.

SCOS

361. The second and third applicants submitted comments regarding cumulative impacts and made submissions in that regard in their appeal. These included:

361.1. the confounding and cumulative effects of seismic blasting with other stressors such as temperature, competition for food, and shipping noise;

361.2. effects on whole populations, not just individuals; and

361.3. the use of a 40 km buffer when simultaneous surveys occur – which is a mitigation in the EMPr but has been discredited in the USA.

Cumulative impacts of other exploration and production projects

362. The Project covers a number of petroleum licence blocks. The BAR (at page 8) describes that the following licence blocks are covered by the application area:

362.1. 12/3/274 ER;

362.2. 12/3/343 ER;

362.3. 12/3/339 ER; and

362.4. 12/3/248 ER.

5128

363. On page 10 of the BAR, Figure 2 indicates that the seismic area covers "OK Energy (ER) Norther Cape Ultra Deep", "TotalEnergies ER Various blocks" and "Africa Oil Corp (ER) Block 3B/4B". Of these blocks:

363.1. Shell Offshore Upstream South Africa B.V., as the operator, and its Joint Venture partners (Qatar Energy Umbono and OK Energy Limited) now jointly hold an exploration right for Licence Block Northern Cape Ultra Deep. At the time of signing this affidavit, a draft Environmental and Social Impact Assessment Report was made available for public comment on 11 November 2024, in terms of which it is planned to drill up to five exploration and/or appraisal wells and to conduct geophysical surveys.

363.2. The TotalEnergies blocks cover the Deep Water Orange Basin project. TotalEnergies EP South Africa B.V. was granted environmental authorisation on 23 October 2023 for the drilling of up to ten exploration wells. The EA sets out that the drilling is planned to commence between the first quarter of 2024 and fourth quarter of 2024. The Minister subsequently confirmed the EA in her appeal decision of 24 April 2024, and it is unknown at this stage when these drilling operations will commence. However, it is conceivable that these operations may overlap with the seismic operations of TGS or Searcher.

363.3. Africa Oil SA Corp, Ricocure (Pty) Limited and Azinam Limited were

granted environmental authorisation for exploration drilling of up to five exploration wells in Block 3B/4B on 16 September 2024. Appeals against that decision, including an appeal by the applicants, are currently before the Minister. Whilst I do not know when the exploration right was granted to the holders, the Scoping Report for this project indicates that the joint venture partners submitted an application to renew the Exploration Right, which was approved as the First Renewal Period for a two year term from 27 October 2022 to 26 October 2024. I do not know whether a third and final renewal of two years has been granted.

364. Given the existing rights that are held for these licence blocks, and the applications for environmental authorisation that were submitted to the Department of Mineral Resources and Energy, the proposed activities were within the knowledge of both the decision-makers at the time that they took their decisions.

365. **Despite the overlap of the licence blocks with the project area, and that the intentions for these blocks were known at the time that the EA was granted and confirmed on appeal, neither the BAR nor the decisions consider the cumulative impacts that arise from these overlapping activities.**

366. Given the limited remaining durations of the exploration rights held for the overlapping licence blocks, the possibility that the TGS seismic survey will be undertaken at overlapping times with exploration activities in the overlapping or nearby blocks, cannot be discounted and should have been included in the

assessment of cumulative impacts. Even where the activities may not directly overlap temporally or spatially, the multiple and confounding impacts on a disturbed marine environment should have been considered.

367. The second and third applicants submitted comments regarding cumulative impacts and made submissions in that regard in their appeal. TGS did not provide any response as to why the BAR failed to consider the impacts of other exploration and production activities.

368. In the DG's reasons for his decision in the EA, he simply states without further explanation, that "*The identification and assessment of potential impacts of the activity, including cumulative impacts, was adequately undertaken..*". In the Minister's decision, she states:

> "*2.5.4. In relation to cumulative impacts, I note that the cumulative impacts have been evaluated and set out in the BAR.*"

369. The Minister goes on to consider "cumulative noise impacts" and "noise acoustics". I deal with the insufficiency of the Minister's response to these aspects below, but, in relation to the impacts associated with exploration drilling and other activities in the overlapping and nearby licence blocks, the BAR simply does not consider these impacts at all. Short of any direct reference to consideration of these impacts in the DG's or Minister's decisions, of which there is none, the cumulative impacts associated with these activities have not been considered.

370. In terms of acoustic harms to marine ecosystems, the failure to consider cumulative impacts is a significant flaw, if not fatal. As described under the first ground of review above, Dr. Fournet, in her summary of her comments on the Acoustic study, explains that each additional project in or near the proposed survey region is associated with a set of risks that compound when they occur in close spatial or temporal proximity.

370.1. If multiple projects did occur at the same time, this would extend the overall high noise exposure to the environment, rendering the modelled sound emission level ("SEL") in the Acoustics Report incorrect, increasing the probability of harm for marine organisms, and increasing the probability for elevated stress levels in marine organisms at a regional level.

370.2. In turn, if multiple projects were to occur at the same time, it would also render the mitigation measures even less effective. For example, she explains, that part of the EIA mitigation plan hinges on there being a 'safe place' for marine organisms to retreat to avoid the impacts of extremely high amplitude sound, or by minimizing the spatial and temporal scale of sound exposure associated with the project.

370.3. These assumptions are untrue if multiple projects occur simultaneously.

Cumulative climate impacts from exploitation of oil and gas resources

371. In addition, the BAR did not consider the cumulative climate impacts of greenhouse gas emissions referred to in the third ground of review above, and in the expert affidavit of Mark New and in the report by New and Meckle attached thereto.

372. Having regard to the global Climate Emergency and South Africa's international commitment in the NDC to *'working with others to ensure temperature increases are kept well below 2°C above pre-industrial levels, which could include a further revision of the temperature goal to below 1.5°C in light of emerging science'* by reducing greenhouse gas (GHG) emissions, TGS's proposed 3D seismic survey would, if additional commercially viable resources are identified and developed through to production phase, inevitably add to South Africa's overall GHG emissions.

373. The same can be said for the dozen or so other offshore oil and gas projects that the government is greenlighting.

374. As a reasonably foreseeable future impact that may become more significant, especially in combination with impacts arising from similar offshore oil and gas exploration and production activities, it is submitted that the cumulative impacts of such GHG emissions need to be identified and assessed. It is further submitted that an evaluation of future emissions is entirely possible.

375. By approving each project in isolation, the government cannot know whether

OLS

the major push to develop South Africa's oil and gas resources is consistent with the country's climate change obligations. Where effectively no oil and gas is being produced, the introduction of these many projects could have an outstanding influence on South Africa's carbon budget, potentially far exceeding its NDC targets. There is no adequate reason for why this type of cumulative GHG assessment was not done, and approving each project without this cumulative impact assessment is unreasonable and contrary to the requirements of NEMA.

376. New and Meckel agree, and provide a clear and relatively straightforward methodology to transparently estimate hydrocarbon volumes that might possibly be produced by a series of commercially-viable oil and gas projects in the future and the associated greenhouse gas (GHG) emissions from those projects.

377. Had the cumulative impacts of the Project been properly assessed, it would have been demonstrated that TGS has failed to prove, in the light of the cumulative impacts and the gaps in knowledge, that there is no risk of significant harm to marine life and to present and future generations of South Africans arising from climate change impacts.

378. Consequently, the application of the precautionary principle should have caused the EA to be refused.

379. While the BAR purported to assess cumulative impacts, as I have explained

FCJS

above, it failed to do so in respect of the gaps in knowledge I have identified above in respect of marine impacts, the impacts of other exploration and production projects in or near the project area; and cumulative climate impacts from exploitation of oil and gas resources.

380. The eighth ground of review is that the BAR failed adequately to assess the cumulative impacts and risks of seismic blasting, in breach of sections 2(d) and 3(1)(j)(i) and (o) of Appendix 1 to the EIA Regulations read with section 2(4)(a)(vii) of NEMA, with the result that the EA and the Minister's decision to uphold it are reviewable on one or more of the following PAJA review grounds:

380.1. a mandatory and material procedure or condition prescribed by an empowering provision was not complied with, as contemplated in section 6(2)(b) of PAJA;

380.2. relevant considerations were not considered, as contemplated in section 6(2)(e)(iii) of PAJA;

380.3. the action was procedurally unfair, as contemplated in section 6(2)(c) of PAJA;

380.4. the EA and appeal decision contravened a law and were not authorised by the empowering provision, as contemplated in section 6(2)(f)(i) of PAJA); and

380.5. the EA and the Minister's decision are not rationally connected to the information before them, as contemplated in section 6(2)(f)(ii)(cc) of PAJA.

381. Alternatively, the EA and appeal decision are reviewable in terms of the constitutional principle of legality.

PART G: SUMMARY OF THE REVIEW GROUNDS

382. **The first ground of review** is that the BAR omitted relevant information and considerations in respect of impacts on marine life, and that the decisions of the DG and the Minister were not rationally connected to the information before them, were irrational and/or unreasonable, and failed to give adequate consideration to the precautionary principle, in breach of sections 24O(1)(b), 24(4) and 2(4)(a)(vii) of NEMA, and Regulation 41(6) of the EIA Regulations, with the result that the EA and the Minister's decision to uphold it are reviewable on one or more of the following PAJA review grounds:

382.1. a mandatory and material procedure or condition prescribed by an empowering provision was not complied with, as contemplated in section 6(2)(b) of PAJA;

382.2. relevant considerations were not considered, as contemplated in section 6(2)(e)(iii) of PAJA;

FLJS

382.3. the action was procedurally unfair, as contemplated in section 6(2)(c) of PAJA;

382.4. the EA and appeal decision contravened a law and were not authorised by the empowering provision, as contemplated in section 6(2)(f)(i) of PAJA); and

382.5. the EA and the Minister's decision are not rationally connected to the information before them, as contemplated in section 6(2)(f)(ii)(cc) of PAJA.

383. Alternatively, the EA and appeal decision are reviewable in terms of the constitutional principle of legality.

384. The second ground of review is that the public participation process followed by the EAP in the EIA process did not ensure that persons in vulnerable and disadvantaged communities were given sufficient opportunity to develop the understanding, skills and capacity necessary for achieving equitable and effective participation, or ensure that community well-being and empowerment was adequately promoted through environmental education, the raising of environmental awareness, the sharing of knowledge and experience and other appropriate means, in breach of Regulation 40 of the EIA Regulations read with section 2(4)(c), (f), (g), (h) (o) and section 24(1A)(c) of NEMA, with the NEMA Guideline on Public Participation, and with sections 9, 10, 24 and 33 of the

Constitution, with the result that the EA and the Minister's decision to uphold it are reviewable on one or more of the following PAJA review grounds:

384.1. a mandatory and material procedure or condition prescribed by an empowering provision was not complied with, as contemplated in section 6(2)(b) of PAJA;

384.2. relevant considerations were not considered, as contemplated in section 6(2)(e)(iii) of PAJA;

384.3. the action was procedurally unfair, as contemplated in section 6(2)(c) of PAJA;

384.4. the EA and appeal decision contravened a law and were not authorised by the empowering provision, as contemplated in section 6(2)(f)(i) of PAJA); and

384.5. the EA and the Minister's decision are not rationally connected to the information before them, as contemplated in section 6(2)(f)(ii)(cc) of PAJA.

385. Alternatively, the EA and appeal decision are reviewable in terms of the constitutional principle of legality.

386. The third ground of review is that the Minister failed to consider the reduced

need for the seismic survey due to part of the Project area already having been surveyed, and the BAR failed to conduct a rational assessment of need and desirability in that the BAR

386.1. considered only the potential positive impacts of the production of oil and gas for the purposes of determining need and desirability and not the potential negative impacts thereof, which was inconsistent and irrational, in breach of sections 2(b) and 3(1)(f) of Appendix 1 to the EIA Regulations read with Regulation 18 thereof;

386.2. failed to conduct a proper assessment of the option of not implementing the activity , in breach of section 24(4)(b)(i) of NEMA read with the EIA Regulations; and

386.3. failed to conduct an assessment of the potential social, economic and environmental impacts of the exploration and production of oil and gas, , in breach of 24(4)(b)(i) of NEMA read with the EIA Regulations.

with the result that the EA and the Minister's decision to uphold it are reviewable on one or more of the following PAJA review grounds:

386.3.1. a mandatory and material procedure or condition prescribed by an empowering provision was not complied with, as contemplated in section 6(2)(b) of PAJA;

386.3.2. relevant considerations were not considered, as contemplated in section 6(2)(e)(iii) of PAJA;

386.3.3. the action was procedurally unfair, as contemplated in section 6(2)(c) of PAJA;

386.3.4. the EA and appeal decision contravened a law and were not authorised by the empowering provision, as contemplated in section 6(2)(f)(i) of PAJA); and

386.3.5. the EA and the Minister's decision are not rationally connected to the information before them, as contemplated in section 6(2)(f)(ii)(cc) of PAJA.

387. Alternatively, the EA and appeal decision are reviewable in terms of the constitutional principle of legality.

388. The fourth ground of review is that conditions of authorisation in the EA required the submission of further plans by the developer to the competent authority for approval without any public participation in regard thereto, in breach of section 3(1)(h) of Appendix 1 and section 1(1)(d) of Appendix 4 to the EIA regulations, Regulations 40 and 41 to the EIA regulations, and of the rights of IAPs in respect of *audi alteram partem*, with the result that the EA and the appeal decisions are reviewable on one or more of the following PAJA review

JS JS

grounds:

388.1. a mandatory and material procedure or condition prescribed by an empowering provision was not complied with, as contemplated in section 6(2)(b) of PAJA;

388.2. the action was procedurally unfair, as contemplated in section 6(2)(c) of PAJA;

388.3. the EA and appeal decision contravened a law and were not authorised by the empowering provision (section 6(2)(f)(i) of PAJA); and

388.4. the EA and the Minister's decision are not rationally connected to the purpose of the empowering provision, as contemplated in section 6(2)(f)(ii)(bb) of PAJA.

389. Alternatively, the EA and appeal decision are reviewable in terms of the constitutional principle of legality.

390. The fifth ground of review is that the BAR failed, with respect to the ICMA, to determine the policy and legislative context within which the proposed activity is located and how the activity complies with and responds to the policy and legislative context, or to contain the information that is necessary for the competent authority to consider and come to a decision on the application, as contemplated in sections 2(1)(a) and 3(1) of Appendix 1 of the EIA Regulations

read with sections 12 and 63 of the ICMA, with the result that the EA and the Minister's decision to uphold it are reviewable on one or more of the following PAJA review grounds:

390.1. a mandatory and material procedure or condition prescribed by an empowering provision was not complied with, as contemplated in section 6(2)(b) of PAJA; and

390.2. relevant considerations were not considered, as contemplated in section 6(2)(e)(iii) of PAJA.

391. Alternatively, the EA and appeal decision are reviewable in terms of the constitutional principle of legality.

392. The sixth ground of review is that the EMPr is materially deficient and fails adequately to set out the impacts and risks that need to be avoided, managed and mitigated, or to provide an identification of the manner in which the impact management outcomes will be achieved, the method of monitoring the implementation of the impact management actions, and the mechanism for monitoring compliance with the impact management actions, as required by sections 1(1)(f), (g) and (k) of Appendix 4 to the EIA Regulations, which constitutes a breach of Regulation 19(4) of the EIA Regulations read with s 24N(2) of NEMA, with the result that the EA and the Minister's decision to uphold it are reviewable on one or more of the following PAJA review grounds:

392.1. a mandatory and material procedure or condition prescribed by an empowering provision was not complied with, as contemplated in section 6(2)(b) of PAJA;

392.2. relevant considerations were not considered, as contemplated in section 6(2)(e)(iii) of PAJA;

392.3. the EA and appeal decision contravened a law and were not authorised by the empowering provision, as contemplated in section 6(2)(f)(i) of PAJA); and

392.4. the EA and the Minister's decision are not rationally connected to the information before them, as contemplated in section 6(2)(f)(ii)(cc) of PAJA.

393. Alternatively, the EA and appeal decision are reviewable in terms of the constitutional principle of legality.

394. The seventh ground of review is that the EA failed to contain a plan which locates the proposed activity or activities authorised at an appropriate scale, in breach of Regulation 28(c) of the EIA Regulations, with the result that the EA and the Minister's decision to uphold it are reviewable on one or more of the following PAJA review grounds:

394.1. a mandatory and material procedure or condition prescribed by an

empowering provision was not complied with, as contemplated in section 6(2)(b) of PAJA;

394.2. relevant considerations were not considered, as contemplated in section 6(2)(e)(iii) of PAJA;

394.3. the EA and appeal decision contravened a law and were not authorised by the empowering provision, as contemplated in section 6(2)(f)(i) of PAJA); and

394.4. the EA and the Minister's decision are not rationally connected to the information before them, as contemplated in section 6(2)(f)(ii)(cc) of PAJA.

395. Alternatively, the EA and appeal decision are reviewable in terms of the constitutional principle of legality.

396. The **eighth ground of review** is that the BAR failed adequately to assess the cumulative impacts and risks of seismic blasting, in breach of sections 2(d) and 3(1)(j)(i) and (o) of Appendix 1 to the EIA Regulations read with section 2(4)(a)(vii) of NEMA, with the result that the EA and the Minister's decision to uphold it are reviewable on one or more of the following PAJA review grounds:

396.1. a mandatory and material procedure or condition prescribed by an empowering provision was not complied with, as contemplated in section

FC28

6(2)(b) of PAJA;

396.2. relevant considerations were not considered, as contemplated in section 6(2)(e)(iii) of PAJA;

396.3. the action was procedurally unfair, as contemplated in section 6(2)(c) of PAJA;

396.4. the EA and appeal decision contravened a law and were not authorised by the empowering provision, as contemplated in section 6(2)(f)(i) of PAJA); and

396.5. the EA and the Minister's decision are not rationally connected to the information before them, as contemplated in section 6(2)(f)(ii)(cc) of PAJA.

397. Alternatively, the EA and appeal decision are reviewable in terms of the constitutional principle of legality.

RELIEF

398. The Applicants respectfully submit that this is not a case in which the decisions under review should be remitted to the decision-makers. For reasons fully canvassed above, the BAR is fatally flawed by reason of its limited scope and

EMS

cannot serve as a basis for lawful decision-making.

399. In the premises, we submit that the Court should make an order in terms of section 8(1)(c)(ii)(a) declaring that the environmental authorisation is refused.

COSTS

400. The applicants have brought these proceedings in the public interest alongside the interests of Aukotswa. I am advised that in such circumstances a litigant is, as a rule, not liable for an adverse costs order in favour of the State Respondents, if unsuccessful, save in circumstances where the proceedings were vexatious, frivolous or misconceived.

401. I submit that none of the above exceptions apply in the circumstances of this case. This application is based on substantial grounds and has good prospects of success.

402. I am further advised that a litigant in the position of the applicants should not be liable for the costs of a private respondent such as TGS.

403. The question of costs will be fully addressed in argument at the hearing.

CONCLUSION

404. In the circumstances, I respectfully submit that the applicants have established

that the decisions fall to be reviewed and set aside in terms of section 6 of PAJA, alternatively, in terms of the constitutional principle of legality.

405. The applicants accordingly pray for an order in terms of the notice of motion, subject to the right to supplement the grounds for review upon receipt of the decision-makers records of decision in terms of rule 53.

JOHANNES WALTER STEENKAMP

I hereby certify that the deponent has declared that he knows and understands the contents of this Affidavit and that to the best of his knowledge and belief it is the truth, which Affidavit has been signed to and affirmed to before me at CAPE TOWN on this the 13 day of NOVEMBER 2024.

COMMISSIONER OF OATHS

"A1.1"

AUKOTOMA FISHERIES PRIMARY CO-OPERATIVE

(Registration Number: 2018/000121/24)

(Hereinafter referred to as the "Co-Operative")

RESOLUTION SUBMITTED TO THE DIRECTORS (CONSTITUTING ALL OF THE DIRECTORS OF THE CO-OPERATIVE):

1. **RECITALS**

WHEREAS the Co-Operative intends bring a review application in the High Court of South Africa having jurisdiction, in respect of TotalEnergies EP South Africa BV ("TEEPSA") and TGS Geophysical Company (UK) Limited ("TGS") for relief set out in the notices of motion (the "Applications"), *inter alia*, to apply for an order to review the decisions of the competent authorities and, more specifically, the following:

1.1. The Environmental Authorisation ("EA") granted by the Department of Mineral Resources and Energy to TEEPSA to undertake exploration drilling activities in the Deep Water Orange Basin ("DWOB"); and the appeal decision of the Ministry of Forestry Fisheries and the Environment to uphold the EA; and

1.2. The EA granted by the Department of Mineral Resources and Energy to TGS to conduct seismic survey activities in the DWOB and the appeal decision of the Ministry of Forestry Fisheries and the Environment to uphold the EA.

2. **RESOLUTIONS**

2.1. NOW THEREFORE BE IT RESOLVED THAT as per the decision of the Co-Operative on 14 October, the Co-Operative may and will proceed to bring the Applications in the appropriate division of the High Court or any forum with jurisdiction to adjudicate upon the Applications; and

2.2. BE IT FURTHER RESOLVED THAT the Co-Operative appoints and authorises Chennells Albertyn Attorneys, as attorneys of record for the Co-Operative, to proceed with any application, action or legal process to enforce the rights of the Co-Operative in respect of the Applications together with interest and legal costs; and

2.3. BE IT FURTHER RESOLVED THAT Johannes Wetta Shatoma (Identity Number: 7909085417083) in their capacity as Chair of the Co-Operative, be authorised to sign and/or depose to any and all documentation, inclusive of founding affidavits, replying affidavits and/or any ancillary affidavits, certificates or supporting documents in support of the Application.

CONFIRMATORY AFFIDAVIT: PRIYANKA NAIDOO

I, the undersigned,

PRIYANKA NAIDOO

do hereby make oath and state as follows:

1. I am the Legal and Outreach Advisor of The Green Connection NPC ("Green Connection").

P.N.

2. The Green Connection NPC's registered office is situated at Unit B1, Clareview Business Park, 236 Imam Haron Road, Claremont, Cape Town.

3. I am duly authorised to depose to this affidavit on behalf of The Green Connection NPC, who is the second applicant.

4. The facts contained in this affidavit are within my personal knowledge, unless the context indicates otherwise, and are, to the best of my knowledge and belief, both true and correct.

5. I have read the founding affidavit deposed to by Johannes Walter Staenkamp. I confirm all of the allegations in the founding affidavit insofar as they pertain to me and to The Green Connection NPC.

PRIYANKA NAIDOO

I hereby certify that the deponent knows and understands the contents of this affidavit and that it is to the best of the deponent's knowledge both true and correct. This affidavit was signed and sworn to before me at _____ on this the ___ day of _____ 2024, and that the Regulations contained in Government Notice R.1258 of 21 July 1972, as amended by R1648 of 19 August 1977, and as further amended by R1428 of 11 July 1989, having been complied with.

ENVIRONMENTAL AUTHORISATION IN TERMS OF SECTION 24 OF THE NATIONAL ENVIRONMENTAL MANAGEMENT ACT, 1998 (ACT 107 OF 1998) AS AMENDED, READ WITH REGULATION 19 OF ENVIRONMENTAL IMPACT ASSESSMENT (EIA) REGULATIONS, 2014 AS AMENDED, FOR THE PROPOSED 3D SEISMIC SURVEY ACTIVITIES LOCATED BETWEEN APPROXIMATELY 120 KM OFFSHORE OF ST HELENA BAY, EXTENDING NORTH ALONG THE WESTERN COASTLINE TO APPROXIMATELY 230 KM OFFSHORE OF HONDEKLIP BAY, OFF THE WEST COAST OF SOUTH AFRICA.

I, **Mr Jacob Mbele**, in terms of the powers delegated to me, in terms of regulation 24 of the National Environmental Management Act, 1998 (Act 107 of 1998): Environmental Impact Assessment Regulations, 2014 (hereafter referred to as 'EIA Regulations') decided to grant an environmental authorisation (hereafter referred to as the authorisation) in respect of the application lodged on 06 September 2022. Herewith attached, is the copy of the authorisation and reasons for the decision to grant.

5023

You are instructed in terms of regulation 4(2) of the EIA Regulations to notify all interested and affected parties (I&APs), in writing, within fourteen (14) days of the date of the decision, of the outcomes of your application. You are also required to inform I&APs of the procedure to submit appeals against the decision as contained in the National Environmental Management Act, 1998 (Act 107 of 1998): National Appeals Regulations, 2014 (hereafter referred to as 'Appeals Regulations').

Should you wish to appeal the decision or any aspect thereof, you must submit an appeal in the prescribed form and in accordance with Chapter 2 of the Appeals Regulation, within twenty (20) days from the date of notification of the decision. The said must be submitted to the Minister of Forestry, Fisheries, and the Environment, and copies sent to the Department of Mineral Resources and Energy (Head Office) and the Petroleum Agency SA by one of the following means:

1) **Department of Forestry, Fisheries, and the Environment**
   Appeals and Legal Review Directorate

JL2S

The authorised activities shall not commence within twenty (20) days of the date of signature of this authorisation. Please note that should the Minister of Forestry, Fisheries, and the Environment receive appeals against this authorisation or conditions thereof, this authorisation will be suspended in accordance with section 43(7) of NEMA pending the decision on such appeals.

Yours sincerely,

.....

MR JACOB MBELE

ENVIRONMENTAL AUTHORISATON IN TERMS OF THE NATIONAL ENVIRONMENTAL MANAGEMENT ACT, 1998 (ACT 107 OF1998) AS AMENDED ("NEMA") AND ENVIRONMENTAL IMPACT ASSESSMENT REGULATIONS, 2014 AS AMENDED

IN RESPECT OF

THE PROPOSED 3D SESIMIC SURVEY ACTIVITIES OFFSHORE, OFF THE WEST COAST, SOUTH AFRICA

APPLICATION DETAILS

Application Reference Number	12/1/040
Holder of Environmental Authorisation	TGS Geophysical Company (UK) Limited
Location of the Activity	The EA application area is located between approximately 120 km offshore of St Helena Bay, extending north along the western coastline to approximately 230 km offshore of Hondeklip Bay. It covers several petroleum license blocks.
Size of the Environmental Authorisation application area	Approximately 5 740 000 ha

This authorisation does not negate the holder of the authorisation of the responsibility to comply with any other statutory requirements that may be applicable to the undertaking of the proposed activity.

DECISION ON THE AUTHORISATION

ACRONYMS

AGENCY	: Petroleum Agency SA
BAR	: Basic Assessment Report
DEPARTMENT	: Department of Mineral Resources and Energy
ECO	: Environmental Control Officer
EA	: Environmental Authorisation
EIA	: Environmental Impact Assessment
EIA REGULATIONS	: EIA Regulations, 2014, as amended
EMPr	: Environmental Management Programme
I&APs	: Interested and Affected Parties
MPRDA	: Mineral and Petroleum Resource Development Act, 2002 (Act 28 of 2002), as amended
NEMA	: National Environmental Management Act, 1998 (Act 107 of 1998), as amended

The Department is satisfied with the information made available to it, and subject to compliance with the conditions of this authorisation, that the applicant should be authorised to undertake NEMA EIA listed activities specified below. Details regarding the basis on which the Department reached this decision are set out in Annexure 1 of this authorisation.

ACTIVITY (S) AUTHORISED

By virtue of the powers conferred on it by the National Environmental Management Act, 1998 (Act No. 107 of 1998) ("NEMA") and the Environmental Impact Assessment Regulations, 2014 ("EIA Regulations") the Department hereby grants the authorisation to TGS Geophysical Company (UK) Limited to undertake NEMA EIA listed activities specified in section 3 below and as described in the BAR/EMPr submitted on 06 December 2022.

The granting of this authorisation is subject to compliance with conditions specified under section 5 below.

1. DETAILS OF THE HOLDER OF THIS ENVIRONMENTAL AUTHORISATION

TGS Geophysical Company (UK) Limited
TGS, Dukes Court Street
Woking, GU21 5BH
United Kingdom

Contact Person	. Mr Jevon Hilder
Tel	: +44 1483 742644
Cell	: +44 7788 315682
Email	: jevon.hilder@tgs.com

2. DETAILS OF THE ENVIRONMENTAL ASSESSMENT PRACTITIONER

Environmental Impact Management Services (Pty) Ltd
PO Box 2083
Pinegowrie
2123

Contact Person	: Mr Liam Whitlow
Tel	: +27(0) 11 789 7170
Email	: liam@eims.co.za

3. LIST OF ACTIVITIES AUTHORISED

The following activity as listed under the EIA Regulations, 2014: Government Notice No. R983 of 04 December 2014, is authorised:

Listing Notice 1

Activity Number	**: 21(b)**
Listed Activity	: Any activity including the operation of that activity which requires a reconnaissance permit in terms of section 74 of the Mineral and Petroleum Resources Development Act, 2002 (Act No. 28 of 2002), as well as any other applicable activity as contained in this Listing Notice or

TGS Geophysical Company (UK) Limited-12/1/040

In Listing Notice 3 of 2014, required to exercise the reconnaissance permit, excluding:

(a) any desktop study; and

(b) any arial survey.

The holder of this authorisation is authorised to conduct the following activities within the area described under section 4 below:

- Acquisition of 3D seismic survey data, which involves generation of high-level, low frequency sound pulses by an acoustic instrument towed behind a survey vessel below the sea surface. The sounds are directed towards the seabed and the seismic signal is reflected by the geological interfaces below the seafloor. The reflected signals are received by an array of receivers or sets of hydrophones towed behind the vessel in a single streamer (2D) or in multiple streamers (3D) and are fed back to the recording instruments on board.
- The survey would involve a seismic sound source and multiple hydrophone streamers, which would be approximately 6 000 m long and 2 000 m wide. The streamers would be towed at a depth of 8 m below the surface and would not be visible, except for the tail-buoy at the terminal end of the cable.
- The array has an operating pressure of 2 000 pounds per square inch. The sound source would be towed behind the vessel at a depth of between 5 – 25 m below the surface. As the survey vessel would be restricted in maneuverability, other vessels should remain clear of it. Therefore, a support vessel usually assists in the operation of keeping other vessels at a safe distance.
- Each triggering of a sound source is termed a seismic pulse, and these are discharged at intervals of 6 – 20 seconds (depending on water depth and other environmental characteristics). Each seismic pulse is usually only between 5 and 30 milliseconds in duration, despite peak levels within each pulse being high, the total energy delivered into the water is low.
- Seismic sources have an energy frequency range of 5-300 Hz, with the optimal frequency required for deep penetration seismic work being 50-60 Hz. Sound levels from individual sound sources used today in the seismic industry range from 200 to 255 dB re 1 µPa at 1 m, for small to large individual seismic sources, respectively.
- For sound source arrays, sound levels range from 235 dB re 1 µPa at 1 m for a small array (500 cubic inches) to 260 dB re 1 µPa at 1 m for large arrays (7 900 cubic inches). Most of the produced energy is below 250 Hz, with 90% of the energy between 70 to 140 Hz, although pulses do contain some higher frequencies up to 16 kHz. It must be noted, however, that the sound level specifications for sound source arrays refer to sound levels in the vertical direction directly beneath the sound source array, generally near its centre, with nominal sound levels in the horizontal direction being ~10-20 dB lower.

- The seismic vessel travels along a transect of a prescribed grid within the application area chosen to cross any known or suspected geological structure in the area at a speed of between four and six knots during acquisition of data. The survey vessel length is approximately 100 m.

4. LOCATION OF THE APPLICATION AREA

The EA application area is located in the Northern and Western Cape Provinces approximately 120 km offshore of St Helena Bay extending north along the western coastline to approximately 230 km offshore of Hondeklip Bay. It covers several petroleum license blocks. The area is approximately 5 740 000 hectares in extent and is adjacent to the Namaqualand and West Coast District Municipalities. The application area coordinates are listed in Table 1 below.

Table 1: Coordinates of the application area

Point	Latitude	Longitude	Point	Latitude	Longitude
1	32°59'53.46"S	16°35'02.75"E	6	30°40'18.36"S	13°20'38.26"E
2	32°59'57.95"S	13°53'17.25"E	7	30°22'53.91"S	13°35'15.39"E
3	32°39'06.43"S	13°53'26.20"E	8	30°15'21.82"S	14°04'05.31"E
4	32°09'29.22"S	13°58'04.38"E	9	30°15'27.76"S	14°52'28.65"E
5	31°31'44.64"S	13°39'01.12"E			

5. CONDITIONS OF THE AUTHORISATION

5.1 SCOPE OF AUTHORISATION

5.1.1 The holder is authorised to undertake activities specified in section 3 above.

5.1.2 The authorised activities must only be carried out within the application area specified in section 4.

5.1.3 The holder of this authorisation is responsible for ensuring compliance with the conditions of this authorisation.

5.1.4 Any person(s) acting on behalf of the holder, inclusive of contractor(s), subcontractor(s), consultant(s), and employees are also subject to the conditions of this authorisation. This condition, however, does not exonerate the holder from its accountability and responsibility to ensure compliance with the conditions of this authorisation.

5.1.5 Any changes to, or deviations from, and amendments to the proposed activities and conditions of this authorisation must be approved in writing by this Department before such changes, deviations or amendments are effected. The Department reserves the right to request the submission of information deemed necessary to assess and evaluate the significance and impacts of such changes, deviations, and amendments. Any changes, deviations and amendments may be subject to the provisions of Chapter 5 of the EIA Regulations, 2014 pertaining to the amendments of this authorisation.

5.2 NOTIFICATION AND APPEAL OF AUTHORISATION

5.2.1 The holder must, in writing, within fourteen (14) days of the date of this authorisation, notify all I&APs of the outcome of the application.

5.2.2 The notification contemplated above must, amongst other issues:

5.2.2.1 Stipulate the date of the decision, and the date of issue of the authorisation

5.2.2.2 Provide reasons for the decision.

5.2.2.3 Inform I&APs of the appeals procedure in terms of the National Environmental Management Act, 1998. National Appeals Regulations (GN R 993 of 08 December 2014).

5.2.2.4 Draw the attention of the I&APs to the manner in which they may access the decision, including obtaining the copy of the authorisation.

5.3 COMMENCEMENT OF THE ACTIVITY(S)

5.3.1 This authorisation will only be effective in the event that an application for reconnaissance permit is granted in terms of the Mineral and Petroleum Resources Development Act, 2002 (Act 28 of 2002). None of the activities listed in this authorisation may therefore commence without a reconnaissance permit.

5.3.2 The authorised activities shall not commence within twenty (20) days of the date of this authorisation, pending potential lodgement of appeal(s).

5.3.3 Where an appeal is lodged against the decision by any party, this authorisation or any provision or condition thereof will be suspended in accordance with section 43(7) of the National Environmental Management Act, 1998; and as such you may not commence with any activity, until a decision on the appeal(s) is taken.

5.3.4 The authorised activities must commence within a period of one (1) year from the date of issue of this authorisation. If commencement of the authorised activities does not occur within the said period, the authorisation lapses, unless an extension is granted in terms of regulation 30 of the EIA Regulations, 2014. If the authorisation lapses and the holder intends undertaking the authorised activity(s), a new authorisation in terms of the EIA Regulations, 2014 must be obtained.

5.4 MANAGEMENT, MONITORING AND AUDITING OF OPERATIONS INCLUDING REPORTING REQUIREMENTS

5.4.1 The BAR/EMPr is hereby approved. It is hence mandatory for the holder to implement all the recommendations and management measures stipulated in the EMPr throughout all phases of the proposed activities.

5.4.2 Any non-compliance with the EMPr constitutes non-compliance with this authorisation, and any non-compliance with this authorisation may result in its suspension and may render the holder guilty of an offence in terms of section 49A of NEMA and may, if convicted, be liable for penalty as contemplated in terms of section 49B(1).

5.4.3 Should there be changes in the operation and management of the authorised activities, the EMPr must be amended to accommodate those changes and be submitted to the competent authority for approval before implementation commences.

5.4.4 The holder of this authorisation must undertake the necessary measures, to ensure that operators, contractors, subcontractors, and any person(s) acting on behalf of the holder, has full awareness of the recommendations of the EMPr before commencing with any authorised activity

5.4.5 The EMPr must be included in all contractual documentation entered thereto between the holder and contractor(s).

5.4.6 A copy of the EMPr must always be kept onboard survey vessel(s).

5.4.7 The holder must, before the commencement of the authorised activity, appoint the following:

5.4.7.1 An independent and experienced Environmental Control Officer (ECO) who will ensure that the conditions of this authorisation and recommendations of the EMPr are implemented and adhered to.

5.4.7.2 Independent, qualified, and experienced Marine Mammal Observers (MMO), Passive Acoustic Monitoring (PAM) Operators and Fisheries Liaison Officer (FLO) to monitor the interaction between marine mammals and survey operations and interactions with other marine users for the duration activity.

5.4.8 The holder of this authorisation must submit daily and monthly environmental monitoring reports during seismic survey operations. Furthermore, the holder must within sixty (60) days of completion of the 3D seismic survey, submit a survey closure report, completed by the ECO.

5.5 SPECIFIC CONDITIONS

5.5.1 The holder or appointed ECO must, thirty (30) days before the commencement of the seismic surveys, distribute notifications to the I&APs including the Agency informing them of the operational plans. The said notifications must include the following:

5.5.1.1 Commencement date, including survey and support vessel(s) mobilisation date, and anticipated duration of the survey.

5.5.1.2 Details of the seismic survey and support vessels.

5.5.1.3 Sketch plans showing the operational area(s) including survey grids.

5.5.1.4 Details of the ECO, FLO, MMO, PAM Operators and contact details for reporting environmental issues associated with the planned activities.

5.5.1.5 Invitation to I&APs to confirm if they should be included in the distribution list for daily MMO, PAM and FLO reports.

5.5.2 Avoid operating during periods of peak fishing efforts and migratory season of cetaceans and their aggregates on the summer feeding grounds between St Helena Bay and Dassen Island.

5.5.3 The National Environmental Management: Protected Areas Act, 2003 prohibits any exploration activities within the Marine Protected Areas, National Parks, and Nature Reserves. The holder must ensure that none of the authorised activities take place within these areas. Furthermore, a 5 km buffer zone must be implemented around all Marine Protected Areas during seismic survey data acquisition.

5.5.4 Marine Mammal Observers must be equipped with infra-red cameras.

5.5.5 Passive Acoustic Monitoring is mandatory where visual observations are not possible due adverse weather conditions or at night. If PAM system is not functional, operations must temporarily be suspended to prevent any potential impacts to marine mammals.

5.5.6 The holder must submit a Shipboard Oil Pollution Emergency Plan (SOPEP) in accordance with MARPOL 73/78 Annex I and the National Oil Spill Continency Plan (NOSCP).

5.5.7 In addition to SOPEP, Emergency Response and Medical Evacuation Plan must be submitted. The said plans must take into consideration all resources that may be required in case of an oil spill incident or any emergency incident. The plans must be submitted to the Petroleum Agency

JCDS

SA (hereafter referred to as the ' Agency") thirty (30) days before the mobilisation of the seismic survey vessel.

5.5.8 Ensure that 'turtle-friendly' tail buoys are used by the survey contractor or existing tail buoys are fitted with either exclusion or deflector 'turtle guards'.

5.5.9 Ensure that solid streamers are used instead of fluid-filled streamers to avoid leaks.

5.5.10 Maintain a pre-acquisition watch of sixty (60) minutes before any instances of seismic source testing, to confirm that there are no penguins or feeding aggregations of diving seabirds, shoaling large pelagic fish, turtles, seals, or cetaceans within 500 m of the seismic source, and implement a "soft- start" procedure as defined in the approved BAR/EMPr. If only a single lowest power seismic source is tested, the pre-acquisition watch period can be reduced to thirty (30) minutes.

5.5.11 Line changes and break in acquisition must follow the procedures defined in the approved BAR/EMPr and must be synchronized with "soft-start" procedures as defined in the approved BAR/EMPr.

5.5.12 Terminate seismic source on detection and/or observation of mortality or injuries of marine life within the 500m mitigation zone.

5.5.13 Illegal dumping of waste or any equipment aboard the vessels is prohibited. In the event of loss of any equipment that presents risks to the navigational activities, other marine users and the environment, measures to retrieve lost equipment must be undertaken, and such incidents must be reported to the Agency and South African National Hydrographic Office within twelve (12) hours of occurrence.

5.5.14 During the demobilisation process, the holder must ensure that the survey area is left as it was prior to the operations and all I&APs must be informed of the completion of the survey. The holder remains accountable and liable for any residual or latent risks that may occur or are identified at completion of the surveys. In this regard, necessary measures to address such risks are mandatory.

5.5.15 Develop a community engagement protocol that is based on the San Code of Research Ethics. This should be done in consultation with the affected communities and must include a community strategy and grievance mechanism.

5.5.16 All recommended mitigation measures included in the BAR/ EMPr dated 08 December 2022 are deemed to be conditions of this authorisation and must therefore be adhered to.

803

6. GENERAL

A copy of this authorisation and the EMPr must be kept onboard the seismic survey vessel to ensure appropriate implementation of the mitigation measures.

7. DISCLAIMER

The Department shall not be responsible for any damages or losses suffered by the holder in an instance where the operation is temporarily or permanently stopped for reasons of non-compliance with the conditions as set out herein or any other subsequent document or legal action emanating from this decision.

8. RECOMMENDATION

In view of the above, and having taken into consideration environmental management principles as set out in section 2 of NEMA, and information presented in the environmental authorisation application and BAR, and subject to compliance with conditions of this authorisation, this Department is satisfied that the proposed activities will not be in conflict with the objectives of the Integrated Environmental Management set out in Chapter 5 of NEMA and will not result to any detrimental risks to the environment and public. The authorisation is accordingly granted.

.....

MR JACOB MBELE
DIRECTOR-GENERAL
DATE OF THE EA: 17/4/2023

EWS

APPENDIX 1: REASONS FOR DECISION

1. Information Considered in Making the Decision

All the information presented to the Department was considered in making this decision. The said information includes amongst others:

1.1 The provisions of Chapter 5 of the NEMA which relates to the Integrated Environmental Management and section 2 NEMA principles; the EIA Regulations, 2014 and other relevant NEMA regulations and guidelines.

1.2 Environmental Authorisation application dated 06 September 2022.

1.3 The information contained in the final BAR/EMPr, compiled by an independent Environmental Assessment Practitioner (EAP) registered with the Environmental Assessment Practitioner Association of South Africa (EAPASA) from Environmental Impact Management Services (Pty) Ltd, submitted to the Department on 06 December 2022

1.4 The information contained in the following specialist reports received by the Department on 06 December 2022:

1.4.1 Biodiversity and Ecosystem Services Assessment prepared by Pisces Environmental Services (Pty) Ltd

1.4.2 Fisheries Specialist Study prepared by Capricorn Marine Environmental (Pty) Ltd.

1.4.3 Heritage Impact Assessment prepared by PGS Heritage (Pty) Ltd.

1.4.4 Social Impact Assessment prepared by Equispectives Research & Consulting Services.

1.4.5 Sound Transmission Loss Modelling prepared by SLR Consulting Australia (Pty) Ltd.

1.5 The results of the Public Participation Process submitted with the BAR/EMPr, which highlighted issues, objections, concerns, and comments raised by various I&APs and responses by the EAP.

2. Submission and Consideration of the Basic Assessment Report and Environmental Management Programme

2.1 In terms of regulation 19(1)(a) and (b) of the EIA Regulations, 2014, the applicant must, within ninety (90) days of receipt of the application by the competent authority, submit to the competent authority-

(a) A basic assessment report, inclusive of specialist reports, an EMPr and where applicable a closure plan, which was subjected to a public participation process of at least thirty (30) days and which reflects the incorporation of comments received, including any comments of the competent authority; or

(b) a notification, in writing, that the basic assessment report, inclusive of the specialist reports, and EMPr and where applicable a closure plan, will be submitted within one hundred and forty (140) days of receipt of the application by the competent authority, as significant changes were made or significant new information was added to the basic assessment report or EMPr or, where applicable, a closure plan, which changes or information was not contained in the report or plans consulted on during the initial public participation process contemplated in sub-regulation (1)(a) and that the revised reports or EMPr or, where applicable, a closure plan will be subjected to another public participation process of at least thirty (30) days.

2.2 An application for the authorisation was submitted on 06 September 2022 and acknowledged on 19 September 2022, informing the applicant to submit a BAR/EMPr on or before 06 December 2022. The BAR/EMPr was submitted to the Department on 06 December 2022.

3. Key Findings

Careful consideration of information submitted to the Department, thus resulted in the following conclusions:

3.1 All fundamental and procedural requirements prescribed in the applicable legislation is satisfied.

3.2 The proposed 3D seismic survey is a widely used oil and gas exploration technology worldwide. The said technology is currently used in South Africa and is generally regarded as non-intrusive in nature. The technology poses potential impacts on fisheries and marine fauna. However, majority of the impacts were assessed to range between low to very low significance with mitigation.

3.3 The identification and assessment of potential impacts of the activity, including cumulative impacts, was adequately undertaken, and the proposed mitigation and management measures are aligned with potential impacts. Furthermore, the implementation of mitigation measures in all phases of the proposed 3D seismic survey activities will ensure that the planned activities will not result in any detrimental impacts on the environment.

3.4 The motivation for the need and desirability of the proposed 3D seismic survey activity is in line with the requirements of the EIA Regulations, 2014 and it addressed key issues in the Need and Desirability Guideline

3.5 Project Alternatives: The location, layout, scheduling, technology, and no-go alternatives were identified and briefly assessed. However due to the nature of proposed exploration operations, no in-depth assessments were carried out. The preferred location was selected based on its high likelihood of containing significant hydrocarbon reserves. The preferred 3D seismic survey is considered a suitable technology to achieve the intended objective of the proposed project. In addition, seismic survey technology is currently the only commercially available technology to achieve the desired objectives of the project. The no-go alternative was not preferred due to the positive impacts that might be derived from undertaking the planned project. The layout and scheduling alternatives were assessed in consideration of sensitive areas and periods of peak fishing activity and marine fauna movements. The layout and scheduling of the proposed project will therefore consider the aforementioned aspects.

3.6 The Public Participation Process (PPP) complied with chapter 6 of the EIA Regulations, 2014 and related guidelines. The PPP included the following:

(a) Identification and notification of I&APs inclusive of authorities, fisheries, and non-governmental organizations.

(b) Notifications in English, Afrikaans and isiXhosa were distributed to pre-identified I&APs through registered mail, fax, email, and SMS.

(c) Site notices written in English, Afrikaans and isiXhosa were placed at 100 onshore locations along the west coast from 16 to 20 August 2022.

(d) Newspaper advertisements were published in five newspapers i.e., Cape Times (English and IsiXhosa), Sentinel News (English and Afrikaans), Weslander (English and Afrikaans), Ons Kontrei and Die Platteriander (English and Afrikaans) between 19 and 26 August 2022.

(e) Radio advertisements were published in four radio stations i.e., KFM (English), Radio NFM (English and Afrikaans), Radio West Coast (English and isiXhosa) and Radio Namaqualand (English and Afrikaans) between 26 August to 03 September 2022.

(f) Initial series of public meetings were held in Cape Town, Hout Bay, Saldanha Bay, Lamberts Bay, Hondeklip Bay and Port Nolloth between 29 August and 03 September 2022.

(g) A second series of public meeting were held in the same locations between 31 October and 05 November 2022, including a virtual meeting held on MS Teams on 10 November 2022

(h) Comments and issues raised by I&APs were adequately addressed in the BAR/EMPr.

4. Conclusion

In view of the above and having taken into consideration environmental management principles as set out in section 2 of NEMA this Department is satisfied that the proposed activities will not conflict with the objectives of the Integrated Environmental Management set out in Chapter 5 of the National Environmental Management Act, 1998 and will not result to any detrimental risks to the environment and public. This environmental authorisation is accordingly granted.

APPEAL DECISION

APPEALS AGAINST THE DECISION TAKEN BY THE DEPARTMENT OF MINERAL RESOURCES AND ENERGY, TO GRANT AN ENVIRONMENTAL AUTHORISATION TO TGS GEOPHYSICAL COMPANY (UK) LIMITED FOR THE PURPOSE OF THE PROPOSED TGS ORANGE BASIN RECONNAISSANCE PERMIT PROJECT, LOCATED OFFSHORE OFF THE WEST COAST, SOUTH AFRICA

Western Cape Department of Environmental Affairs and Development Planning	First Appellant
Ajkolowa Fisheries Primary Cooperative Ltd	Second Appellant
Angela Joubert	Third Appellant
Oceans not Oil Coalition	Fourth Appellant
Elaine Mills	Fifth Appellant
Natural Justice/Green Connection	Sixth Appellant
TGS Geophysical Company (UK) Limited	Applicant
Department of Mineral Resources and Energy	Competent Authority

APPEALS AGAINST THE DECISION TAKEN BY THE DEPARTMENT OF MINERAL RESOURCES AND ENERGY, DATED 17 APRIL 2023 TO GRANT AN ENVIRONMENTAL AUTHORISATION TO TGS GEOPHYSICAL COMPANY (UK) LIMITED FOR THE PURPOSE OF THE PROPOSED TGS ORANGE BASIN RECONNAISSANCE PERMIT PROJECT, LOCATED OFFSHORE OFF THE WEST COAST, SOUTH AFRICA.

Appeal: These appeals were lodged against the decision taken by the Department of Mineral Resources and Energy to granting an Environmental Authorisation to TGS Geophysical Company (UK) Limited, on 17 April 2023, for certain 3D seismic survey activities in the orange basin, located offshore off the West Coast of South Africa, approximately 120km offshore of St Helena Bay, extending north along the West Coastline to approximately 230km offshore of Hondeklip Bay.

1. BACKGROUND

1.1 On 22 September 2022, TGS Geophysical Company (UK) Limited (the Applicant) applied to the Department of Mineral Resources and Energy (DMRE) for an Environmental Authorisation (EA) to conduct specified 3D seismic survey activities in the Orange Basin, located offshore off the West Coast of South Africa, approximately 120km offshore of St Helena Bay, extending north along the West Coastline to approximately 230km offshore of Hondeklip Bay.

1.2 This application was submitted in terms of the National Environmental Management Act, 1998 (Act No. 107 of 1998) (NEMA) as amended, read with the Environmental Impact Assessment Regulations, 2014 (2014 EIA Regulations) to the DMRE, being the Competent Authority (CA) in respect of this application.

1.3 As required by regulation 12 of the 2014 EIA Regulations, the Applicant commissioned Environmental Impact Management Services (Pty) Ltd (EIMS) as an independent environmental assessment practitioner (EAP), to prepare and submit the application for EA.

1.4 In support of this application for an EA, and as required by Regulation 19 of the 2014 EIA Regulations, the EAP submitted the Basic Assessment Report (BAR) dated 6 December 2022 for consideration and decision making.

TGS

APPEALS AGAINST THE DECISION TAKEN BY THE DEPARTMENT OF MINERAL RESOURCES AND ENERGY, DATED 17 APRIL 2023 TO GRANT AN ENVIRONMENTAL AUTHORISATION TO TGS GEOPHYSICAL COMPANY (UK) LIMITED FOR THE PURPOSE OF THE PROPOSED TGS ORANGE BASIN RECONNAISSANCE PERMIT PROJECT, LOCATED OFFSHORE OFF THE WEST COAST, SOUTH AFRICA.

1.5 In terms of the BAR:

1.5.1 The proposed project area is located between approximately 120km offshore of St Helena Bay, extending north along the western coastline to approximately 230km offshore of Hondeklip Bay over a number of petroleum licence blocks. The Application Area for the proposed 3D seismic survey is approximately 57 400 km² in extent (the Area);

1.5.2 It is proposed that a single survey vessel equipped with seismic sources and streamers be used. The proposed 3D survey would be supported by up to two escort vessels. The 3D survey will take in the order of 70 days including downtime;

1.5.3 The application is, in accordance with the NEMA-Listed activity/ies for Listed Activity 21(b) (GNR 983) as follows:
"Any activity including operation of that activity which requires a reconnaissance permit in terms of section 74 of the Mineral and Petroleum Resource Development Act, as well as any other applicable activity as contained in the Listing Notice or in Listing Notice 3 of 2014, required to exercise the reconnaissance permit, excluding- (a) any desktop study; and (b) any aerial survey."

1.6 On 17 April 2023, the DMRE granted the EA to the applicant under DMRE reference number PSA Ref: 12/1040.

1.7 The registered and affected parties (I&APs) were informed of the decision to grant the EA on 26 April 2023.

1.8 The Directorate: Appeals and Legal Review (Appeals Directorate) within the Department of Forestry and Fisheries and the Environment (the Department) received the following appeals against the decision that was taken to grant the Applicant an EA:

JCS

APPEALS AGAINST THE DECISION TAKEN BY THE DEPARTMENT OF MINERAL RESOURCES AND ENERGY, DATED 17 APRIL 2023 TO GRANT AN ENVIRONMENTAL AUTHORISATION TO TGS GEOPHYSICAL COMPANY (UK) LIMITED FOR THE PURPOSE OF THE PROPOSED TGS ORANGE BASIN RECONNAISSANCE PERMIT PROJECT, LOCATED OFFSHORE OFF THE WEST COAST, SOUTH AFRICA.

1.8.1 First Appellant – Western Cape Department of Environmental Affairs and Development Planning on 15 May 2023

1.8.2 Second Appellant - Aukotowa Fisheries Primary Cooperative Ltd on 15 May 2023;

1.8.3 Third Appellant - Angela Joubert on 12 May 2023;

1.8.4 Fourth Appellant - Oceans not Oil Coalition on 12 May 2023;

1.8.5 Fifth Appellant - Elaine Mills on 12 May 2023; and

1.8.6 Sixth Appellant - Natural Justice/Green Connection on 12 May 2023.

1.19. These appeals were lodged in terms of section 43(1) of NEMA, read together with Regulation 4 of the National Appeal Regulations, 2014 (2014 Appeal Regulations).

1.20. On or between 2-12 June 2023, the Applicant submitted its responding statements to the appeals in terms of Regulation 5 of the 2014 EIA Regulations.

1.21 The DMRE submitted comments in respect of the First, Second, Fourth and Fifth Appellants' grounds of appeal on 26 June 2023.

1.22. The appeals are premised on the grounds summarised below:

1.22.1 First Appellant's grounds of appeal

- Cumulative impacts not assessed and lack of scientific knowledge to gauge the impact of seismic acoustic blasts and their effect on the marine environment;
- Activities approved in the absence of a Strategic Environmental Assessment.

1.22.2. Second Appellant's grounds of appeal

- Concerns about the consultation process;
- Concerns that the process was not open and a transparent participatory in accordance with NEMA;

SWS

- Questioning the submissions from the Applicant regarding the "perceived impact" of proposed activities as opposed to the "actual impact".
- Concerns that granting the EA does not meet South Africa's climate change goals, e.g., Paris Agreement and Kyoto Protocol, and effort to achieve net zero.

1.22.3. Third Appellant's grounds of appeal:

- lack of in-depth studies on impact of acoustics instruments on the ocean and marine life.

1.22.4. Fourth Appellant's grounds of appeal:

- Need and desirability of the project;
- invasive nature of seismic surveys;
- Repeated, persistent or cumulative exposure impacts;
- No formal analysis of impact on livelihoods;
- No-go not properly considered.

1.22.5. Fifth Appellant's grounds of appeal:

- Need and desirability of the project;
- invasive nature of seismic surveys;
- Repeated, persistent or cumulative exposure impacts;
- No formal analysis of impact on livelihoods;
- No-go not properly considered.

1.22.6. Sixth Appellants' grounds of appeal:

- Need and desirability of the project;
- Invasive nature of seismic surveys;
- Repeated, persistent or cumulative exposure impacts;
- No formal analysis of impact on livelihoods;
- No-go not properly considered

1.23. This is an appeal in a "wide" sense. I have therefore approached the appeal by reassessing and re-determining the merits of the EA application.

1.24. Before I deal with each of the grounds of appeal, I wish to stress that I was guided in this appeal by the principles set out in section 2 of NEMA. These principles apply alongside all of the other appropriate and relevant considerations, including Government's responsibility to respect, protect, promote and fulfil the social and economic rights in Chapter 2 of the Constitution and in particular the basic needs of persons disadvantaged by unfair discrimination. My decision has therefore been guided after a careful consideration of all of the principles set out in section 2 of NEMA, including section 2(2) which provides that 'environmental management must place people and their needs at the forefront of its concern and serve their physical, psychological, developmental, cultural and social interests equitably"; also section 2(3) which provides that "*development must be socially, environmentally and economically sustainable*". Moreover, when I considered the issue of sustainable development, I did so with section 2(3) in mind and I considered the proper application of the factors articulated in section 2(4)(a) to (r).

1.25. I am also guided by the judgement in *Earthlife Africa Johannesburg v Minister of Environmental Affairs and Others*[1] where at para 80 of this judgment, the Honourable Murphy J explained that:

> "*NEMA, the act legislation, must be interpreted purposively and in a manner that is consistent with the Constitution, paying due regard to the text and context of the legislation. Section 2 of NEMA sets out binding directive principles that must inform all decisions taken under the Act, including decisions on environmental authorisations. The directive principles serve as guidelines (by reference) to which any organ of state must exercise any function when taking any decision in terms of NEMA or any statutory provision concerning the protection of the environment. They guide the interpretation,*

[1] [2017] 2 All SA 519 (GP)

administration and implementation of NEMA, and any other law concerned with the protection or management of the environment. Competent authorities must take into account the directive principles when considering applications for environmental authorisation. The directive principles promote sustainable development and the mitigating principle that environmental damage must be avoided, minimised and remedied. The environmental impact assessment process is a key means of promoting sustainable development, by ensuring that the need for development is sufficiently balanced with full consideration of the environmental impacts of a project with potential environmental impacts. The directive principles caution decision-makers to adopt a risk-averse and a careful approach, especially in the face of incomplete information."

1.26. **With this in mind, I now deal with the grounds of appeal submitted by each of the appellants and where I deem it appropriate, I shall address those grounds of appeal that are overlapping in nature or duplicated under a single ground of appeal.**

2. GROUNDS OF APPEAL, RESPONSES AND COMMENTS

First Appellant's Grounds of Appeal

2.1. The First Appellant raised the following grounds of appeal:

2.1.1. Cumulative Impacts was not assessed in that there is insufficient scientific knowledge to gauge the impact of seismic acoustic blasts and their effect on the marine environment; and

2.1.2. Activities were approved in the absence of a Strategic Environmental Assessment (**SEA**).

First Appellant's Submissions

FWS

APPEALS AGAINST THE DECISION TAKEN BY THE DEPARTMENT OF MINERAL RESOURCES AND ENERGY, DATED 17 APRIL 2023 TO GRANT AN ENVIRONMENTAL AUTHORISATION TO TGS GEOPHYSICAL COMPANY (UK) LIMITED FOR THE PURPOSE OF THE PROPOSED TGS ORANGE BASIN RECONNAISSANCE PERMIT PROJECT, LOCATED OFFSHORE OFF THE WEST COAST, SOUTH AFRICA.

2.2. The First Appellant made the following submissions in support of its grounds of appeal:

2.2.1. The impact of seismic acoustic blasts is not conclusive and therefore presents an environmental risk to the marine environment if undertaken. It was submitted that in terms of section 2 of NEMA the "precautionary principle" applies in South Africa and that unlike other counties, South Africa's policy and legal framework requires more conclusive evidence to support an activity with a potential significant impact over a large area;

2.2.2. The cumulative impacts of reconnaissance, exploration and mining and drilling activities have not been assessed and evaluated in the context of the impact on other marine and coastal-based economic activities;

2.2.3. it (the First Appellant) commented on the BAR and noted the inconclusiveness of scientific knowledge on the impact of seismic surveys incorporating acoustic blasts on the marine environment;

2.2.4. Reference was made to the decision of the Western Cape High Court judgement in the case of *Christian John Adams & Others v Minister of Mineral Resources and Energy & Others (case number: 13062/22)* where the applicants in that matter presented the argument that cumulative impacts of seismic surveys have not been studied in South Africa and that the impact on fish assemblages was difficult to interpret; and

2.2.5. The activities have been approved in the absence of SEA, which would serve to coherently plan/co-ordinate the activities to manage the cumulative impacts. The decisions taken are "piece-meal" and do not ensure the development of the nation's mineral and petroleum resources in a proper, orderly and ecologically sustainable manner while promoting justifiable social and economic development as per the objectives set out in section 2(h) of the Mineral and Petroleum Resource Development Act 28 of 2002 (MPRDA).

Applicant's response:

2.3. The Applicant responded to the First Appellant's grounds of appeal as follows:

2.3.1. The assumptions and limitations, including knowledge gaps, were included in the BAR. Having regard to these information gaps, the assessment of the impact of the proposed activities adopted a strongly precautionary approach. It is acknowledged that information on deep-water habitats and their associated biota is lacking however, this is primarily due to the difficulties and high costs associated with sampling beyond the inner continental shelf;

2.3.2. Virtually all of the limited information available has been obtained during hydrocarbon exploration projects, which in themselves provided a good opportunity for collecting baseline data at depths beyond which commercial fisheries operate. Information from such ecological baseline surveys is, however, not always made publicly available as it is often considered proprietary information;

2.3.3. Even with the information gaps, the level of certainty (confidence rating) of the impact predictions in the marine fauna report is considered high;

2.3.4. Furthermore, the Project may be able to contribute to conducting independent research on how fish species on the West Coast (such as snoek) respond to seismic surveying. As the location of this particular survey is far offshore, the impact on the biophysical environment is expected to be relatively low. The Project is seen as a good opportunity to obtain local data and to conduct local research that could be useful for similar projects and applications that may take place in the future. The Applicant undertook to liaise with relevant scientific research institutions to investigate the potential of collaborating in independent on-water research during the survey, as recommended in the BAR;

2.3.5. The the decision referred to by the First Appellant in *Christian John Adams & Others v Minister of Mineral Resources and Energy* is not directly comparable to the application for EA, primarily because the extent of the proposed application area is significantly smaller and is located approximately 200km offshore. Thus, the extent of sensitive environments within the Project area is substantially smaller and will affect a substantially smaller number of users;

FWS

2.3.6. For both technical and commercial reasons, it is unlikely that concurrent seismic surveys will be undertaken in the same area during the same survey window. However, the cumulative impacts associated with multiple surveys were assessed and detailed in Section 9.3.5 of the BAR. Furthermore, the cumulative impacts were considered as part of each of the impacts identified for the entire project as detailed and described where relevant in Section 9.3 of the BAR.

2.3.7. In addition, the offshore activities are proposed and authorised within a framework of existing legislation, policies and management plans, such as those described in detail in Sections 4 and 8.6 of the BAR. In addition, the law currently does not require that a SEA be undertaken as a precursor to a project receiving an EA.

2.3.8. Furthermore, it was the submission of the First Appellant that undertaking a SEA would be purely speculative in the context that the Project relates to the reconnaissance for a resource and directly to the development of the resource that may potentially be located offshore. Thus, while a SEA would provide an additional framework within which the potential future development of the resources should be considered, such a SEA would rely on the outcome of the exploration to define the nature and extent of the potential resource. Accordingly, without this information a SEA for development of the resource would be purely speculative.

2.3.9. Finally, as stated in section 8.3.10 of the Social Impact Assessment Report (Mitigation and Management), assessing all cumulative impacts of the seismic survey industry on the livelihoods of communities and addressing perceptions and alleviating fear from a strategic perspective is not the Applicant's responsibility and falls outside the scope of the environmental impact assessment. It is the responsibility of the relevant authorities and the industry. However, the seismic survey industry as a whole has and should continue to assess on an ongoing basis its position and social license to operate as an industry in a South African context and work with stakeholders to conduct a SEA of the impact of the industry and further embark on an awareness raising and education campaign. A participatory process, beyond only having meetings is needed including workshops where communities can engage in experiential learning. If the seismic survey industry fails to

JCDS

address the community's need for education and cooperation, it will result in significant delays and increase the risk for social unrest. The Applicant has already commenced working with the energy industry alliance, EnerGeo, and with PASA to initiate discussion within the industry. EnerGeo has also been engaged in the consultation process on PASA's new community consultation guidelines.

Competent Authority's Response:

2.4. The Competent Authority responded as follows:

2.4.1. The precautionary principle was considered and followed throughout the EIA process. This process assessed potential and cumulative impacts of the proposed activity and recommended mitigation measures. The recommendations and implementation of the mitigation measures for potential impacts is a precautionary measure.

2.4.2. Whilst gaps in knowledge and limitations in experiments on marine species are acknowledged, precautionary measures have been put in place to manage potential impacts. It should be noted that the limitations in experiments are because the experiments were conducted in controlled environments and therefore, the impacts were noted early and were exaggerated. The literature indicates that the behavior of the tested species would differ in their natural environment. Seismic surveys are undertaken globally with standard and specific mitigation measures without any evidence of injuries and behavioral changes of species that were related to the operations. It can therefore be concluded that the implementation of recommended globally used mitigation measures minimizes the impact on marine species.

2.4.3. The Competent Authority is not responsible for conducting a SEA. Furthermore, the authorised activity followed and met the minimum requirements of the current relevant legislation. Hence, it was approved.

2.4.4. It is therefore satisfied with the assessment conducted by the EAP on behalf of the Applicant.

5628

2.5. Evaluation (Reasons for Decision)

2.5.1. The crux of this ground of appeal relates to the cumulative impact of reconnaissance, exploration and mining on the ocean and sea life in general.

2.5.2. In this regard, I take note that the seismic survey right was granted to the applicant under section 24 of the 2014 EIA Regulations and in respect of specific and limited areas being the areas specific to 120km offshore of St Helena Bay, extending north along the Western Coastline to approximately 230km offshore of the Hondeklip Bay, off the West Coast of South Africa.

2.5.3. The EA also sets out detailed conditions that must be met by the Applicant, in conducting the intended seismic surveys and I refer to each of the conditions set out in 5.5 of the EA, as if specifically incorporated herein. These conditions incorporate the mitigation measures set out in the BAR which are specifically designed to limit any interference to marine and sea life in the vicinity of the intended survey, and to ensure adequate and proper monitoring of the intended activities on such marine life.

2.5.4 In relation to cumulative impacts, I note that the cumulative impacts have been evaluated and set out in the BAR.

Cumulative noise impacts:

2.5.5. In light of the limited studies on cumulative impacts and on seismic activities, I note that EAP has recommended a number of measures specifically aimed and curbing any cumulative noise impacts associated with multiple studies, albeit that it is unlikely that such activities will be undertaken during the same survey window due to impacts on operation and data acquisition. Thus, whilst there are currently two EA applications for seismic

surveys pending before the DMRE, which overlap the areas of the Project, it is unlikely that they will proceed at the same time as the Project.

2.5.6. Even if these activities are undertaken during the same window, in considering the associated impacts to marine fauna as a result of the three potential surveys, the EAP concludes that such impacts would be of high intensity and extend regionally over a short term and concludes therefore that the consequence for cumulative survey is medium[2]. In particular EAP notes that three seismic surveys of regional extent, undertaken simultaneously, would be expected to result in an impact of medium negative significance on the large pelagic longline sector, both with and without the application of mitigation measures, but without any residual impact once the activities are completed. The impacts are thus limited to the planning and operational phases, and it is not anticipated that there will be any need for closure or rehabilitation once the 3D surveys have been concluded. Closure will be limited to waste generation and disposal and water contamination and pollution measures which aligns with the pre-development.

2.5.7. I further note that the following mitigation measures in relation to noise have been recommended and included in the EMPr :

- A distance of at least 40 km is maintained between survey vessels until sufficient objective evidence is obtained so that a reduced buffer distance is acceptable;
- Each of the additional activities to those described in the technical noise report would be considered required only in the case where a 40 km buffer distance between active survey ships cannot be maintained;
- Should surveys run simultaneously, it would be required to amend the EMPr, which would be subject to further assessment and consultation.

2.5.8. Having considered that it is firstly unlikely that three survey activities will be conducted during the same window and over the same area and taking into account the mitigation

[2] BAR, para 9.35

JC25

measures proposed by the EMPr, which are part of the specific conditions of the EA, I find that any cumulative impacts on the marine fauna and species is adequately catered for in a precautionary manner.

Noise acoustics

2.5.9. At page 240 of the BAR, it is noted that the impact from immediate exposure to individual airgun array pulses, the maximum zones of PTS effect for sea turtles, are predicted to be within 19 metres from the source location. The behavioural disturbance for sea turtles caused by the immediate exposure to individual pulses are predicted to be within 1.3 km of the source array. In terms of the impact from cumulative exposure to multiple airgun array pulses, the noise impacts related to recoverable injury and TTS on sea turtles are expected to be high at the near field from the source location

2.5.10. As a result, the following mitigation, measures to minimise the seismic impact on assessed marine fauna species has been recommended, and included as part of the EMPr :

- Recommended safety zones- based on the maximum threshold distances modelled for PTS (marine mammals and sea turtles) and potential mortal injury (fish) due to immediate exposure from single pulses and cumulative exposure from multiple pulses;
- Implementing a soft-start procedure if testing multiple seismic sources. Delaying soft-starts if shoaling large pelagic fish, turtles, seals, or cetaceans are observed within the zone of impact;
- Baseline noise measurements can provide useful information (prior to operations) when interpreting underwater noise predictions for the introduction of a new noise source. As such, it is recommended that underwater noise measurements be implemented that would include the deployment of underwater sound monitoring equipment to establish an actual baseline prior to the commencement of the survey and then operational levels of noise during the survey;

5028

- Lower source levels could be achieved through better system optimization, i.e. a better pairing of source and receiver characteristics, and better system gain(s). For example, new receiver technologies, such as fibre optic receivers, may allow the use of lower amplitude sources through a higher receiver density and/or a lower system noise floor. Some evidence exists which indicates that re-engineered seismic sources with "mufflers" can be used to attenuate unwanted high frequency energy without affecting frequencies of interest. In addition, kerosene free hydro-streamers should be used. It is also important to ensure that 'turtle-friendly' tail buoys are used or that existing tail buoys are fitted with either exclusion or deflector "turtle guards'.

2.5.11. In light of the mitigation measures provided, the proposed survey activities to be undertaken by the Applicant are expected to result in impacts on marine invertebrate fauna in the Orange Basin, ranging from negligible to very low significance.

2.5.12. The EAP also considers that some migratory species are now present year-round off the West Coast, e.g. baleen and toothed whales. The BAR recommends that data collected by independent onboard observers should form part of a survey close-out report to be forwarded to the necessary authorities, and any incidence data and seismic source output data arising from surveys should be made available for analysis of survey impacts in Southern African waters. This recommendation has been incorporated into the EA and also sees to the stoppage of any activities in the event of spotting such marine species.

2.5.13. I further note on page 227 of the BAR that the Applicant specifically addresses the concerns in relation to cumulative impact and notes examples where communities can successfully co-exist.

2.5.14. Moreover, I note that the EAP, in the *Impact Prioritisation*, included that each potentially significant impact has been assessed in terms of cumulative impacts as found on page 194 of the BAR.

2.5.15. I am nevertheless aware of the fact that there are certain limitations and gaps in knowledge as confirmed by the Applicant in their response. In this regard, I note that the location of this survey is faroffshore and that the impacts on the biophysical environment are expected to be relatively low. Furthermore, due to the limited local data there is a need for these types of surveys to be conducted to enable the authorities to obtain the much-needed data and conduct local research that will be useful to inform future applications of this manner.

2.5.16. I note the submission that a SEA should have been conducted, however I do not believe that the absence of a SEA is an impediment to the granting of an EA, because neither NEMA nor the EIA Regulations prohibit the undertaking of reconnaissance activities where there is no SEA or Marine Spatial Plan (MSP).

2.5.17. In the circumstances, these grounds of appeal are without merit and are accordingly dismissed.

Second Appellant's Grounds of Appeal

2.6. The Second Appellant raised the following grounds of appeal:

2.6.1. Concerns about the consultation process.

2.6.2. The process was not an open and a transparent participatory process in accordance with NEMA.

2.6.3. The submissions from the Applicant regarding the "perceived impact" of proposed activities as opposed to the "actual impact".

2.6.4. Concerns that granting the EA does not meet South Africa's climate change goals, e.g., Paris Agreement and Kyoto Protocol.

Second Appellant's Submissions

2.7. The Second Appellant made the following submissions in support of its grounds of appeal:

2.7.1. That the consultation process was not properly conducted, and the information presented during the consultation process was not accurate. As community and small-scale fisher organisation, it does not share Government's position of promoting oil and gas exploration especially as there are various concerns related to such activities. Furthermore, this position of Government is particularly concerning when regard is had to the state of the environment in other countries that have adopted a similar approach. It (the Second Appellant) is concerned about safeguarding South Africa's environmental resources for future generations.

2.7.2. The consultation process was not open and transparent as required by NEMA. There was a failure to consult meaningfully with communities on ways to make a positive impact on communities and that this issue should form part of the consultation process. Instead, communities were presented with limited options that do not have regard to the specific needs of communities. Accordingly, the consultation process is not meaningful.

2.7.3. That the reference "perceived impact" as opposed to the "actual impact" is of concern because there are studies that show the actual impact of the proposed activities on marine life. The Second Appellant cites the incident of the 2010 Gulf of Mexico, Deepwater Horizon blowout as an example.

Applicant's Response

2.8. The Applicant submits that:

2.8.1. The Public Partnership Process (PPP) was conducted in line with the 2014 EIA Regulations and the Second Appellant was specifically identified as a key Interested and Affected Party (I&AP) and thus included in the PPP throughout the basic assessment process. It (the Applicant) scheduled public meetings with the Second Appellant, both at the pre-application and at the BAR review phases; however the Second Appellant refused to engage meaningfully during such meetings.

2.8.2. The purpose of the pre-application meeting was to capture the initial concerns of the members and key I&AP's including the Second Appellant. Community members attended this meeting but only for the purposes of publicly protesting and they left before any presentations could be made. During the BAR review phase meeting, members of the Second Appellant did attend and were given an opportunity to present their views and interact with the EAP.

2.8.3. The information in the BAR report regarding the impact of the proposed project is based on the latest research and that the proposed project will not significantly add to the marine traffic in South African waters as it will only involve two vessels. Whilst the Applicant acknowledges that there may have been projects in other countries that have negatively impacted the environment, lessons have been learnt from these projects and protective and mitigatory measures implemented contributing to internationally accepted best practice as reflected in the BAR. These mitigation measures are set out in the EMPr which has been approved.

2.8.4. Significant measures are taken to ensure that there are no unplanned spills and notes further that the vast majority of exploration industry related pollution events have been down to drilling and extraction activities rather than surveying and further, that the findings

of the specialist studies concluded that there are no fatal flaws that should prevent the proposed project from proceeding. Furthermore, the significant levels of identified negative impacts can generally be reduced to acceptable levels through the recommended mitigation measures that form part of the EA.

2.8.5. The consultation process was carried out in compliance with NEMA, read together with the 2014 EIA Regulations. The Applicant noted that the purpose of consultation was not consent seeking but rather an opportunity for affected parties to raise concerns and for these concerns to be considered and brought to the attention of the decision makers, which in this case is the DMRE. In this regard, there was compliance and that the consultations were therefore meaningful.

2.8.6. It (the Applicant) noted that the use of the offshore environment is not restricted to fishing activities and insofar as the small scale fishing industry is concerned, in terms of the impact assessments undertaken and with the implementation of the approved mitigation measures, the significance of the impact of the proposed project can be reduced to acceptable levels and thus would not lead to significant impacts on users of the same environment in terms of biological and socio-economic environment. Accordingly, the proposed project would not lead to the destruction of the livelihood of small-scale fishing industries.

Competent Authority's Response

2.9. The Competent Authority responded as follows:

2.9.1. It found that that the PPP was undertaken in accordance with the PPP Guideline and thus the minimum requirements of NEMA were met. The Second Appellant had an opportunity to and was involved in the PPP process from the onset and was identified as an I&AP and received all relevant information and notifications.

ECOS

2.9.2. All information provided during the PPP was related to the proposed activity and general information was provided relevant to oil and gas in South African and globally. The information referred to by the Second Appellant is unclear and it is therefore not possible to provide a clear response thereto. Oil and gas projects are undertaken in a sustainable manner as regulated by NEMA. Furthermore, the EIA process is designed to ensure that the proposed project is undertaken in a sustainable manner.

2.9.3. The PPP is undertaken in relation to the proposed project activities. In this instance, the proposed project concerned the activity of a seismic survey. The Second Appellant's participation in the PPP is related to raising their concerns, views, objections, and any other related matter that might help in minimizing the impacts of the proposed project activity. As such, the Applicant cannot undertake development activities proposed by communities. It is also important to note that the proposed project has the potential to produce long-term benefits to South Africa, even though immediate benefits are limited. According to the results of the EIA process, the proposed project activity will not result in detrimental impact to the receiving environment.

2.9.4. The impacts on fishing sector were assessed, including impacts on catch rates and it was found that any such negative impacts will be low. The BAR sets out various mitigation measures, such as avoidance of the peak fishing season for the affected sector, and these mitigation measures formed part of the conditions of the EA. Furthermore, blowouts are not expected during the proposed activity.

2.9.5. Past incidences, such as the Deepwater Horizon incident, has led to great improvements in terms of safety during the undertaking on oil and gas activities globally. However, it is to be noted that the proposed project activity differs from the activities undertaken during this incident. Therefore, the potential impacts will also differ. The scientific reports and

information referred to by the Appellant is unclear and therefore it is not possible to respond clearly thereto.

2.9.6. However, there are various resources engaged to monitor and secure the environment and in particular in relation to the fishing activities of the Second Applicant. An Environmental Officer will be appointed to ensure implementation of the approved EMPr. The Marine Mammal Observer and Passive Operator are responsible for monitoring movements of marine species and advising the crew on actions to take. The Fisheries Liaison Officer is responsible for monitoring impacts on marine fauna and communications with maritime vessels.

2.9.7. The authorised activities will not result in detrimental impacts on the receiving environments and therefore, the need for compensation is not expected. The affected area is an open space and thus the focus action would be to clean up the area and make it safe for the activities to continue, should there be a need.

2.9.8. The protocols referred to recognise that there is a need for an energy mix in South Africa and reference various policies that provide for minimization of climate change impacts. The nature and the duration of the planned activities make it impossible to assess the impacts on climate change. According to the results of the EIA, the proposed activity will not result in detrimental impacts on the receiving environment. Whilst there are no immediate benefits anticipated from the proposed activity, however, dependent on the success of the proposed project, there might be future benefits.

2.10. <u>Evaluation (Reasons for Decision)</u>

2.10.1. I have addressed aspects regarding the veracity of the application process and compliance with NEMA, above.

JCDS

2.10.2. Regarding whether the Applicant conducted the PPP in accordance with the 2014 EIA Regulations, I am mindful that one of the purposes of the public participation provisions in NEMA and the 2014 EIA Regulations is to afford I&APs the opportunity to express their views on matters affecting them. This principle was reiterated by the Constitutional Court in *Fuel Retailers Association of Southern Africa v Director General Environmental Management Department of Agriculture and Conservation and Environment Mpumalanga Province*[3] (the Fuel Retailers case).

2.10.3. The 2014 EIA Regulations prescribes the specific requirements for the public participation process (PPP).

2.10.4. Regulations 41(2)(b) & (c) and 41(3) of the 2014 EIA Regulations requires the person conducting the PPP to "*give notice to all potential interested and affected parties of an application or proposed application which is subjected to public participation*" by giving written notice, in any of the manners provided for in section 47D of the Act, and by placing an advertisement in a local newspaper, which "*give details of the application or proposed application which is subjected to public participation.*

2.10.5. Regulations 3(8), 19, 40(1) and 43(1) of the 2014 EIA Regulations require that potential or registered I&APs be given a period of at least 30 days to submit their comments on the BAR and EMPr, amongst other reports, prior to submitting the BAR to the competent authority for decision-making purposes.

2.10.6. Regulation 41(6) of the 2014 EIA Regulations requires the person conducting the PPP to ensure that information containing all relevant facts in respect of the application is made available to potential I&APs and that participation by potential or registered I&APs is

---

3 *Fuel Retailers Association of Southern Africa v Director General Environmental Management Department of Agriculture and Conservation and Environment Mpumalanga Province* 2007 (6) SA 4 (CC) at para 76.

JLS

facilitated in such a manner that they are provided with a reasonable opportunity to comment on the application or proposed application.

2.10.7. Regulation 44(1) requires the applicant to ensure that the comments of I&APs are recorded in the report and that such written comments, including responses to such comments, are attached to the reports that are submitted to the competent authority.

2.10.8. These provisions are written in peremptory terms.

2.10.9. In evaluating the Second Appellants' contentions that they were not adequately consulted in respect of the EA application for the proposed project, I considered page 37 of the BAR, which sets out the process followed in terms of PPP, and which cites the following:

2.10.9.1. The Applicant identified organs of state and Key Stakeholders on page 37 of the BAR who was consulted, and the Second Appellant's name is reflected on page 37;

2.10.9.2. The PPP commenced on 14 August 2022 with an initial notification and call to register as I&APs for a period of 30 days;

2.10.9.3. Notification letters were distributed in English, IsiXhosa and Afrikaans to all I&APs;

2.10.9.4. Newspaper advertisements describing the proposed project and EIA process was placed in the Cape Times (English and isiXhosa), Sentinel News (English and Afrikaans), Weslander (English and Afrikaans), Ons Kontrei (English and Afrikaans) and Die Plattelander (English and Afrikaans) as well as in the National Gazette;

2.10.9.5. Site notices were placed in English Afrikaans and IsiXhosa at 100 onshore locations adjacent to the application area during the week of 16 to 20 August 2022;

5CDS

2.10.9.6. Radio adverts were aired on KFM Radia NFM Radio Namakwaland and Radio West Coast;

2.10.9.7 The BAR was placed for public review to all registered I&APs for a period of 30 days from 21 October -32 November 2022 and hard copies were made available at various venues as set out on page 41 of the BAR;

2.10.9.8. Public meetings were held from 29 August -3 September 2022 at various venues as set out in page 41 of the BAR.

2.10.10. Accordingly, the information before me confirms that the Applicant conducted the PPP in accordance with Chapter 6 of the 2014 EIA Regulations.

2.10.11. Insofar as the Second Appellant has expressed concerns about the perceived impact of the proposed project activities on small scale fishers, I note that with the implementation of the project controls and mitigation measures, that the residual impact of the proposed survey is considered to be of low negative significance.

2.10.12. I further take note that the impact on catch rates due to sound elevation levels was also assessed. The noise effects assessed included physiological effects (physical injurypermanent threshold shift (PTS) and temporary threshold shift (TTS)) and behavioural disturbance due to either immediate impact from single airgun pulses or cumulative effects of exposure to multiple airgun pulses over a period of 24 hours. Sound levels for the seismic survey could notionally be expected to attenuate to below levels for behavioural disturbance at a distance of 4 km from the source. The spatial extent of the impact of sound (produced by the airgun array) on catch rates is expected to be regional, although localised at any one time. In this regard I note that the impact is considered to be of intermediate duration and reversible without additional time or cost. Based on the distance of fishing grounds from the Reconnaissance Permit area, only the large pelagic longline and tuna pole-line sectors are considered to be susceptible to effects of elevated sound. The EAP notes that with the implementation of the project controls and mitigation,

JOS

measures, the residual impact due to seismic noise is considered to be of low negative significance. There is no impact expected on the demersal trawl, midwater trawl, demersal longline, small pelagic purse-seine, linefish, west coast rock lobster, netfish and small-scale fishing sectors.

2.10.13. The BAR also confirms that the application Area does not overlap with the key spawning or nursery areas therefore the risk of noise disturbance to spawning behaviour and fishery recruitment is considered unlikely.

2.10.14. I also note that the following mitigation measures imposed to limit any impact on the fisheries concerned:

2.10.14.1. In order to mitigate the impacts on the large pelagic longline sector, the survey should avoid taking place during June and July;

2.10.14.2. Prior to the commencement of survey activities, affected parties should be informed of the navigational co-ordinates of the proposed survey acquisition area, timing and duration of proposed activities and any implications relating to the safety zone that would be requested, as well as the movements of support vessels related to the project (FishSA, SA Tuna Association, SA Tuna Longline Association and Fresh Tuna Exporters Association);

2.10.14.3. Other key stakeholders should be notified prior to commencement and on completion of the survey (DFFE, the South African Navy Hydrographic Office (SANHO), South African Maritime Safety Association (SAMSA) and Ports Authorities);

2.10.14.4. For the duration of the survey, a navigational warning should be broadcast to all vessels via Navigational Telex (Navtex) and Cape Town radio;

2.10.14.5. Updates of the scheduled weekly survey plan should be circulated to the operators of affected fishing vessels on a daily basis;

508

2.10.14.6.A Fisheries Liaison Officer (FLO) should be present on board the seismic vessel or escort vessel for the duration of the survey In order to facilitate communications between the seismic and fishing vessels in the project area.

2.10.15.Considering the mitigation measures from the specialist studies, I find that the measures to limit the survey to avoid sensitive areas and periods for some marine fauna; movement of migratory cetaceans (particularly beleen whales) from their southern feeding grounds into low latitude waters (June/July and late October/November) and their aggregation on the summer feeding grounds between St Helena Bay and Dassen Island from late October to late December; ensure that migration paths are not blocked by seismic operations; and to avoid periods of peak fishing activity during June and July in order to reduce the probability of disruption to the large pelagic longline fishing sector and tuna pole line fishing sector; are reasonable and sufficient to mitigate against any impact to such fisheries.

2.10.16.I have also considered the Heritage and Social Assessment impact studies report and note that the identified impact on fishing stock is confirmed to be low for all species. By inference, a potential impact on fishing yield could be expected and thus potential economic impact on communities due to reduced caught fish volumes. Pre-mitigation negative impact on a regional scale over the long term with a moderate intensity is predicted due to the potential indirect impact on the communities and, ultimately, their heritage, with a high probability of this impact occurring. The pre-mitigation impact on heritage resources is rated as medium. The potential residual impact on heritage resources, with mitigation measures from the scientific studies, is projected as low with a medium confidence factor.

2.10.17.Although the marine fauna and fisheries specialists have indicated that the impacts on the marine fauna would be negligible, the concern of communities remains that there are significant gaps in the available data. Fishing communities, with generations of experience in the ocean, fear that the behaviour of the fish will change and that this would affect their

catch rates and consequently their livelihoods. The concern of cumulative impacts that will push the ocean beyond recovery from such activities is raised. I do however note that the EAP indicated that the Applicant, as well as other companies that want to do surveys or exploration in the area, currently do not have social license to operate. A large part of this is due to a lack of meaningful consultation by previous applicants from a community perspective. If the Applicant or any other seismic survey company wants to proceed with the project, they will need to engage in meaningful conversation with the communities and try to restore relationships. From a community and social risk perspective this is not negotiable. I further note that the EAP suggested that the project proceed subject to the mitigation measure of meaningful consultation, local research, education, and awareness raising in the project-affected communities. These conditions were incorporated into the EA, which are requirements prior to the commencement of the survey.

2.10.18. I am accordingly satisfied that the impact on the fishing industry has been properly mitigated.

2.10.19. In the circumstances, there is no merit to these grounds of appeal, and they are dismissed.

Third Appellant's Grounds of Appeal

2.11. The Third Appellant raised the following grounds of appeal:

2.11.1. The impact of the 2D and 3D seismic surveys and the sound impulses and multiple hydrophone streamers on the marine mammals and environment is significantly high and detrimental to their well-being, survival and normal functioning, including marine life and the marine eco-system, both short-term and long-term, in various respects including:

- causing physical injuries as well as mobility and orientation within the ocean body, including sea turtles and whales;
- behavioural patterns will be altered;

508

- Mortality rates may increase;
- Negative impact on entire populations and exerting cumulative pressures on already stressed species;
- Impacting on marine fish and mammal food sources like zooplankton.

2.11.2. Detailed impacts of seismic surveying are still unknown; and more research is required;

2.11.3. There is a risk of irreversible damage;

2.11.4. The resultant increase in noise levels is a high risk that will directly and negatively impact marine fish, mammals, fauna and flora and thus the environment.

Applicant's Response

2.12. There was no response from the Applicant.

Competent Authority's Response

2.13. There was no response from the Competent Authority.

2.14. **Evaluation (Reasons for Decision)**

The Third Appellant's appeal is concerned with the impact of the seismic pulses on marine mammals. This aspect has been addressed in detail in the preceding appeals and I refer to my comments in relation thereto.

2.14.1. Accordingly, there is no merit to this ground of appeal, and it is dismissed.

JWS

Fourth, Fifth and Sixth Appellants' Submissions

2.15. The Fourth, Fifth and Sixth Appellants raise the substantially similar grounds of appeal, albeit that some submissions are more detailed than others. The Sixth Appellant made detailed submission in respect of these grounds of appeal and these submissions encapsulate the appeal grounds submitted by the Fourth and Fifth Appellants. As set out above, I address grounds of appeal that are overlapping in nature or duplicated under a single ground of appeal. It is to be noted that these grounds of appeal are extensive extending into over 100 pages. It is therefore not practical to restate the appeal submissions and instead, the grounds of appeal and responses are summarised herein. Regard can be had to the Appeal Response Reports for greater detail.

2.16. The following grounds of appeal were raised:

2.16.1. The desirability assessment is flawed for the following reasons:

- Climate Change Impacts
- The climate crisis
- South Africa's international climate change commitments
- Need for seismic data;

2.16.2. Failure to adequately consider the impact on Marine life;

- Underwater sound from acoustic seismic surveys.
- Harms to marine life
- Acoustic Modelling
- Heightened Legislative Requirements are Not Considered for Critical Biodiversity Areas (CBAs), Ecologically or Biologically Significant Marine Areas (EBSAs), and Marine Protected Areas (MPAs).
- CBAs
- EBSAs and MPAs.

5128

- Cape Fur Seals
- Whale and Dolphins.
- Fish.
- Zooplankton
- The proposed mitigation measures are inadequate to prevent unacceptable harm to marine life.
- Simultaneous Surveys
- Lack of baseline noise assessment
- Chronic Noise Impacts

2.16.3. Failure to adequately assess cumulative impacts;

2.16.4. Failure to conduct meaningful consultation with communities and local people (and in particular small-scale fishers), within the PPP, including the Social Impact Assessment process;

2.16.5. The BAR does not contain a proper and objective assessment of the negative impacts of the project on people's human rights;

2.16.6. Failure to consider relevant coastal management considerations or to comply with the National Environmental Management: Integrated Coastal Management, 2008(Act No. 24 of 2008);

2.16.7. Failure to provide adequate reasons for the decision.

- The Appeal was timeously submitted in accordance with the requirements of NEMA, the 2014 EIA Regulations and the Appeal Regulations, 2014, in writing and accompanied by a detailed appeal document, being a statement setting out the detailed grounds of appeal and accompanied by relevant supporting documentation;

JCS

- There are grounds for judicial review under PAJA because the EA comprises administrative action that *inter alia* it:
  - is unconstitutional and unlawful;
  - was taken because of the failure to consider relevant considerations;
  - is not rationally connected to the information before the decision-maker in making the Decision or to the reasons provided by the decision-maker for the Decision; and
  - is so unreasonable that no reasonable person could have granted it.

<u>Response by the Applicant</u>

2.17. The Applicant also provided a comprehensive response to the grounds of appeal raised by the Sixth Appellant. A summary of the response is set out below and more detail can be obtained from the Appeal Response Reports. I note that the Applicant did not respond to the Fourth and Fifth Appellants; however, as indicated above, the grounds of appeal relied upon by these Appellants are encapsulated in the detailed grounds of appeal raised by the Sixth Appellant and accordingly so are the Applicant's responses.

2.18. The Applicants responds that thee Basic Assessment process was conducted in line with the requirements of the 2014 EIA Regulations. This included amongst others that:

2.18.1. The Need and Desirability of the Project was adequately addressed and assessed (Section 5 of the BAR); Marine and cumulative impacts were considered in detail (Section 9 of the BAR);

2.18.2. The EAP appointed for the project conducted an extensive Public Consultation Process, which resulted in meaningful consultation (Section 7 and Appendix 2 of the BA);

2.18.3. As stated in Section 11.3 of the BAR, the findings of the specialist studies conclude that there are no environmental fatal flaws that should prevent the proposed project from proceeding, provided that the recommended mitigation and management measures are

SWS

implemented. Based on the nature and extent of the proposed project, the local level of disturbance predicted as a result of the reconnaissance activities, the findings of the specialist studies, and the understanding of the significance level of potential environmental impacts, it is the opinion of the EIA project team and the EAP that the significance levels of the majority of identified negative impacts can generally be reduced to an acceptable level by implementing the recommended mitigation measures and the project should be authorized;

2.18.4. It is not clear from the evidence presented by Appellant, that they have a sufficient mandate from the communities that they claim to represent.

Competent Authority's Response

2.19. The Competent Authority provided a response to the Fourth and Fifth Appellants' grounds of appeal but not to the Sixth Appellant's grounds of appeal. As indicated above, the grounds of appeal relied upon by these Appellants are the same and therefore, the Competent Authority's response applies to all these appeals.

2.20. The following response was submitted by the Competent Authority:

2.20.1. Due to the nature and the duration of the authorised activity, the assessment of the climate change impacts was impossible.

2.20.2. The GHG emissions from the activity will not differ from levels produced by vessels passing through the application area.

2.20.3. Seismic surveys are part of the non-destructive exploration activities as listed in Table 8 of Harris et al., 2022 paper, presenting a list of sea use activities and their compatibility. However, the impacts of seismic surveys are known and will be managed according to industry best practices.

2.20.4. The compatibility of seismic surveys on CBAs is conditional, hence the need to undertake the Impact Assessment to understand the impacts associated with the activity and the

measures to mitigate such impacts. Based on the outcomes of the assessment, the potential impacts of the authorised activity can be managed successfully with the implementation of recommended mitigation measures.

2.20.5. Heritage Impact Assessment undertaken by PGS Heritage (Pty) Ltd included in Appendix 3 of the Basic Assessment provide detailed assessment of intangible heritage. Section 8.8.4 of the BAR provides a synopsis of the intangible heritage aspects considered and assessed in the heritage study.

2.20.6. Cumulative impacts and the possibility of multiple surveys being undertaken simultaneously are considered and assessed in section 9.3.1.4 of the BAR. Cumulative impact of the multiple surveys was found to be of medium significance.

2.20.7. The impacts on livelihoods were assessed satisfactorily. The assessment began by first understanding the dynamics of the affected communities including other aspects that might have caused a negative impact on livelihoods such as the COVID 19 pandemic and lastly considered impacts of the activity. This means that the assessment also considered current impacts on communities' livelihoods. The assessment is in section 9.3.3 of the BAR and the impacts of the authorised activity on livelihoods was found to be on low significance with implementation of recommended mitigation measures.

2.20.8. The "no-go alternative" was considered but was not preferred based on the benefits that might be derived from the success of the authorised project. The project did consider climate impacts, but these could not be assessed due to the nature and duration of the authorised activity. Furthermore, the project will emit GHG emissions levels that will be below the threshold that requires reporting. This indicates that the project will not have significant negative contribution to climate change.

2.21. Evaluation (Reasons for Decision)

2.21.1. The Fourth, Fifth and Sixth Respondent's raise certain issues which have already been addressed in relation to the other appeals lodged and I accordingly refer to my assessment of these issues as set out above including:

JW28

2.21.1.1. The cumulative impact of reconnaissance, exploration and mining on the ocean and sea life in general;

2.21.1.2. The PPP; and

2.21.1.3. The impact of the proposed project activities on small scale fishers.

2.21.2. I note that some of the concerns raised by the Appellants extend beyond the proposed project activity in respect of which the EA was granted. I confirm that any activity beyond the EA will be subject to a separate application and a separate assessment process. Accordingly, it is not relevant and therefore not necessary to consider submissions in respect of activities that fall outside the EA for the purposes of this appeal.

2.21.3. I have considered the needs and desirability of the Project. The BAR on page 21-33 thereof addresses the needs and desirability of the Project and further covers the context of the oil and gas industry, applicable policies and planning frameworks (local, national, and international) and broadly societal needs and public interest. I note that the Project is in alignment with government policies and plans such as the Integrated Resources Plan 2019 (IRP) which recognises the need for South Africa to employ a diversified energy mix to meet the country's electricity requirements. I have furthermore considered the Guideline on Need and Desirability as well as the No- Go alternative which is also addressed on page 36 of the final BAR.

2.21.4. I am therefore satisfied that the criteria for the need and desirability for the Project has been demonstrated by the Applicant, in particular that the Project accords with legislative requirements and government policies and plans, including the IRP, the National Development Plan (NDP) and the draft Marine Spatial Planning Sector Plans which includes a Marine Offshore Oil and Gas Sector Plan (the Draft MS Plan). The IRP and the Integrated Energy Plan (IEP) recognise natural gas as a required source to produce electricity and direct thermal energy. Its role to contribute to maintaining base-load

2023

electricity and peak-load electricity is acknowledged, and it is also recognised as a way to transition South Africa towards a lower carbon economy providing the flexibility required to complement renewable energy sources and as a lower-carbon option compared to coal.

2.21.5. Having considered the grounds of appeal and the response thereto by the Applicant and the Competent Authority, I am of the view that the potential impacts and mitigation measures in respect of the Project and environmental receptors have been adequately identified, considered and addressed.

2.21.6. I am satisfied that the socio-economic impacts and mitigation measure on *inter alia*, marine fauna, small scale and commercial fishing have been considered and addressed. Any spill is unlikely, and it is therefore unlikely that there will be a need for compensation.

2.21.7. Many of the comments made by the appellants were made on the assumption that the impacts associated with production had to be considered, not just those associated with exploration. This approach is incorrect. The EA and accordingly, this appeal is limited to considerations of the impacts of exploration which are far less significant and far less invasive than they will be if extraction and production takes place. As such, it is not necessary nor appropriate to consider the possible impacts of a project that is not yet planned and that falls outside the scope of the EA.

2.21.8. That being said, I am concerned about the plight of small-scale fishers and the communities that they belong to. I appreciate this Project presents a cause of concern and anxiety for small scale fishers and communities for whom the well-being of the sea, fish stocks and the environment is crucial to their own physical and emotional wellbeing.

2.21.9. Whilst I am satisfied that communities were consulted and that their concerns were taken into account, I nevertheless take the view that the Applicant needs to do more, on an ongoing basis, to allay their fears and anxiety. This can be done if the communities have

an open channel of communication with the Applicant. Thus, if they have concerns that arise from, for example, things that they may see or hear about that worry them or cause them anxiety, they should be able to raise these with the Applicant and the Applicant should spend time investigating the source of the fears and anxiety to allay them or otherwise address them.

2.21.10. For that reason, I am including a new condition in the EA, requiring the Applicant to appoint a community / fisheries liaison officer, who must be available to the affected communities. The communities must have access to the liaison officer who, in turn, must keep them informed of the activities at regular intervals and be available to answer any questions that they may have. This will go a long way to allying fears and anxiety. This is separate from the grievance procedure.

2.21.11. I note the grounds of appeal related to aspects of human rights and constitutionality. As discussed above, I am guided in this appeal by the principles set out in section 2 of NEMA which apply alongside all of the other relevant considerations including constitutional considerations. I am satisfied that the principles in NEMA are constitutionally sound and that the requirements of the Constitution were met during the EAI process. To the extent that parties are dissatisfied with the constitutional compliance of the process I am advised that the principle of subsidiarity applies and that the appropriate course of action would be for the Constitutionality of NEMA to be challenged.

2.21.12. I note that it is submitted that there was a failure to consider relevant coastal management considerations or to comply with the National Environmental Management: Integrated Coastal Management Act, 2008 (Act No. 24 of 2008) (ICMA). I have considered the BAR and am satisfied that that the provisions of the ICMA and section 63 were considered.

2.21.13. I am accordingly satisfied that all relevant factors have been considered that the decision is lawful and constitutionally sound and administratively fair.

JC28

2.21.14. Therefore, save for including the new condition of creating a liaison officer, I find that the grounds of appeal have no merit and are accordingly dismissed.

3. DECISION

3.1. In reaching my decision on these appeals, I have taken the following information into consideration;

3.1.1. The EA dated 17 April 2023;
3.1.2. Responding statements submitted by the Applicant on 2, 6, 7 and 12 June 2023;
3.1.3. Comments submitted by the CA on 26 June 2023 ; and
3.1.4. The information contained in the project file PASA ref: 12/1/040;
3.1.5. The final EAR report, together with relevant specialist studies annexed thereto.

3.2. In terms of section 43(6) of NEMA, I have the authority, after considering the appeal, to confirm, set aside or vary the decision, provision, condition or directive or to make any other appropriate decision.

3.3. Having carefully considered the appeals and responses to them, together with all other relevant information, I have decided as follows:

3.3.1. The applicant's environmental authorisation is confirmed with the same conditions of authorisation as appeared in section 5 of the competent authority's Reasons for Decision dated 17 April 2023. I have however included a special direction, namely a community / fisheries liaison officer be appointed, and this is to be included in the EA.

3.4. In arriving at my decision, it should be noted that I have not responded to each, and every statement set out in the appeals and/or responses thereto. I have, however, considered all of them. Where a particular statement is not directly addressed, the absence of any

EC25

response thereto should not be interpreted to mean that I agree with or abide by the statement made.

3.5. Should any party be dissatisfied with my decision, it may apply to a competent court to have my decision judicially reviewed. Judicial review proceedings must be instituted within 180 days of notification hereof in accordance with the provisions of sections 6 and 7 of the Promotion of Administrative Justice Act No.3 of 2000.

VMEs	Vulnerable Marine Ecosystems

EXECUTIVE SUMMARY

TGS Geophysical Company (UK) (hereafter TGS) has applied for Environmental Authorization (EA) for a 3D seismic survey off the West Coast of South Africa. Environmental Impact Management Services (Pty) Ltd (EIMS) has been appointed by TGS to prepare and submit an application for EA as per the requirements of the Environmental Impact Assessment (EIA) Regulations, 2014, as amended, promulgated under the National Environmental Management Act (Act No. 107 of 1998- NEMA) and the requirements of the Minerals and Petroleum Resources Development Act (Act No. 28 of 2002 – MPRDA).

The proposed project area is located between approximately 120 km offshore of St Helena Bay, extending north along the western coastline to approximately 290 km offshore of Hondeklip Bay over a number of petroleum licence blocks. The Application Area for the proposed 3D seismic survey is approximately 57 400 km² in extent. It is proposed that a single survey vessel equipped with seismic sources and streamers be used. The proposed 3D survey would be supported by up to two escort vessels. The 3D survey will take in the order of 70 days including downtime.

A Basic Assessment (BA) process is being undertaken to accompany the EA for the EIA Listing Notices listed activities applicable to the project namely:

- **GN983, Listing Notice 1: Activity 21(b):** Any activity including the operation of that activity which requires a reconnaissance permit in terms of section 74 of the Mineral and Petroleum Resources Development Act, as well as any other applicable activity as contained in this Listing Notice or in Listing Notice 3 of 2014, required to exercise the reconnaissance permit, excluding -

  (a) any desktop study; and

  (b) any aerial survey.

PUBLIC PARTICIPATION PROCESS

The PPP for the proposed project has been undertaken in accordance with the requirements of the NEMA EIA Regulations (2014), and in line with the principles of Integrated Environmental Management (IEM). IEM implies an open and transparent participatory process, whereby stakeholders and other I&APs are afforded an opportunity to comment on the project and have their views considered and included as part of project planning.

The comments received from I&APs during the initial call to register and commenting period so far have been captured in the Public Participation Report (PPR) in Appendix 2. This BA report is being made available for public review from 21 October 2022 to 21 November 2022. A high-level summary of the key comments and concerns raised to date are presented below:

- Effects on migratory patterns of fauna along the West Coast;
- Long term marine life impact if the survey finds exploitable resources;
- Impacts on marine life between the survey site and the coast and how this will impact the future of tourism and agriculture;
- Climate change impacts associated with oil and gas;
- Effects on fisheries and catch rates;
- Food security;
- Free Prior and Informed Consent in public participation processes;
- Previous Public Consultation Processes have been viewed as a "tick box exercise";
- Impact on indigenous cultural heritage, historical connection to the sea;
- EIMS' independence if the applicant pays for the services rendered;
- Alternative technologies to seismic surveys;

- Cumulative impacts; and
- A lot of the communities are very poor. Concern that there will be no economic benefits for the communities as a direct result of the survey.

IMPACT ASSESSMENT

The BA report aims to achieve the following:

- Provide an overall assessment of the social and biophysical environments affected by the proposed project.
- Assess potentially significant impacts (direct, indirect and cumulative, where required) associated with the proposed project.
- Identify and recommend appropriate mitigation measures for potentially significant environmental impacts; and
- Undertake a fully inclusive public involvement process to ensure that Interested and Affected Parties (I&APs) are afforded the opportunity to participate, and that their issues and concerns are recorded.

The most significant risks and impacts identified were those that remain high/medium in terms of significance even if post mitigation measures being considered. The following impacts were determined to have a potentially moderate negative final significance:

- Perceived impacts on livelihoods;
- Impacts on sense and spirit of place;
- Impacts on social licence to operate;
- Community expectations;
- Social unrest;
- Uncertainty from a social perspective;
- Concerns about cumulative social impacts; and
- Further marginalization of vulnerable groups.

Mitigation measures have been identified based on input from the Environmental Assessment Practitioner (EAP), public consultation, and specialist assessments. The associated EMPr Appendix 5) includes suggested mitigation mechanisms for avoidance, minimisation and / or management of the negative impacts.

The conclusions and recommendations of this BA are the result of the assessment of identified impacts by specialists, and the parallel process of public participation. The public consultation process has been extensive, and every effort has been made to include representatives of all stakeholders in the study area. The main conclusions from each of the specialist studies are presented below.

NOISE / ACOUSTICS

The zones of potential injuries for fish species with a swim bladder (e.g. shoek), turtles and fish eggs and fish larvae are predicted to be within 180 m from the array source (noise source). However, fish species without swim bladders have higher injury impact thresholds, and therefore have smaller zones of potential injuries within 90 m from the airgun array source.

The zones of potential mortal injuries for fish species with a swim bladder, fish eggs, and fish larvae are predicted to be within 30 m from the adjacent survey lines for all the 24-hour survey operation scenarios considered. For recoverable injury, the zones of impact are predicted to be within 60 m from the adjacent survey lines for fish with a swim bladder for all the operation scenarios considered. Fish without swim bladder are not expected to suffer or any potential injury. The zones of temporary auditory threshold shift (TTS) affect for fish species with

and without swim bladders are predicted to be within 2.9 km from the adjacent survey lines for the relevant 24-hour survey operation scenarios considered. Existing experimental data regarding recoverable injury and TTS impacts for fish eggs and larvae is sparse and no guideline recommendations have been provided. However, based on a subjective approach, noise impacts are expected to be moderate for fish eggs and larvae. Impact is expected to be low for all of them at intermediate and far field from the source location.

Three (3) long range modelling source locations are proposed for the 3D seismic survey. The modelling is representative of the noise propagation within the proposed 3D seismic area. Source location L1 is adjacent to the marine sensitive area (Tripp Seamount – located to the north and outside of the Application Area). L2 represents the average depth of the south survey area and L3 is located towards the deeper water environment of the survey area. As can be seen from the horizontal and vertical contour figures, the received noise levels at far-field locations vary at different angles and distances from the source locations. This directivity of received levels is due to a combination of the directivity of the source array, and propagation effects caused by bathymetry and sound speed profile variations. Thus, it can be said that he sound levels don't change equally over vertical and horizontal distance from the source due to the shape of the sea floor and the direction of the noise source.

In general, the bathymetry profiles with significant upslope section across the continental slope region have the sound propagations experiencing significant attenuation due to the strong interaction between the sound signal and the seabed. The bathymetry profiles with downslope section have much less sound attenuation. These effects are evident in all locations for propagation paths towards shoreline directions.

For all source locations and except for downslope sections, the seabed depth variations are not significant along the propagation paths within the deep-water region. Therefore, the directivity of received noise is dominated by the directionality of the source array.

In terms of the impact from immediate exposure to individual airgun array pulses, the maximum zones of PTS effect for sea turtles are predicted to be within 19 m from the source location. On the other hand, the maximum zones of TTS effect for sea turtles are predicted to be within 24 m of the source array. The behavioural disturbance for sea turtles caused by the immediate exposure to individual pulses are predicted to be within 1.3 km of the source array.

In terms of the impact from cumulative exposure to multiple airgun array pulses, the noise impacts related to recoverable injury and TTS on sea turtles are expected to be high at the near field from the source location. The maximum zones of PTS impact are predicted to range within 10 m of the source array. The maximum zones of TTS effect for sea turtles are predicted to be within 500 m of the source array.

Relevant mitigation measures are recommended to minimise the seismic impact on assessed marine fauna species:

- Recommended safety zones are based on the maximum threshold distances modelled for PTS (marine mammals and sea turtles) and potential mortal injury (fish) due to immediate exposure from single pulses and cumulative exposure from multiple pulses.
- Implement a soft-start procedure if testing multiple seismic sources. Delay soft-starts if shoaling large pelagic fish, turtles, seals, or cetaceans are observed within the zone of impact.
- Baseline noise measurements can provide useful information (prior to operations) when interpreting underwater noise predictions for the introduction of a new noise source. As such, it is recommended that underwater noise measurements be implemented that would include the deployment of underwater sound monitoring equipment to establish an actual baseline prior to the commencement of the survey and then operational levels of noise during the survey.

MARINE ECOLOGY

The Reconnaissance Permit Area, which is approximately 57 400 km² in size, is located in water depths ranging from ~1 500 m to nearly 4 000 m off the South African West Coast between Alexander Bay and Cape Columbine. The seabed sediments comprise sandy muds. Although influenced by the Benguela Current the Reconnaissance

Permit area is located on the western extent of the coastal upwelling cells. Winds come primarily from the southeast, whereas virtually all swells throughout the year come from the S and SSW direction. The bulk of the seawater in the study area is South Atlantic Central Water characterised by low oxygen concentrations, especially at depth. Surface waters in the Reconnaissance Permit Application area will primarily be nutrient poor and clear, being beyond the influence of coastal upwelling, with seasonal (September to March) nutrient peaks expected on the eastern edge of the Reconnaissance Permit Area during periods of upwelling.

The Application Area falls into the Southeast Atlantic Deep Ocean Ecoregions. Although there is a lack of knowledge of the community structure and diversity of benthic macrofauna off the shelf edge, the South Atlantic bathyal and abyssal unconsolidated habitat types have been rated as 'Least Threatened', reflecting the great extent of these habitats in the South African Exclusive Economic Zone (EEZ). Only sections along the shelf edge and in the Cape Canyon are rated as 'Vulnerable' and 'Endangered' (outside of the Application Area). Geological features of note in, and adjacent to, the Application Area are Child's Bank situated at about 31°S and Tripp Seamount situated at about 29°40'S. Two canyons, the Cape Canyon and Cape Valley also occur to the south, but outside of, of the Reconnaissance Permit Area. Features such as banks and seamounts often host deepwater corals and boast an enrichment of bottom-associated communities relative to the otherwise low-profile, homogenous seabed habitats.

Due to its offshore location, plankton abundance is expected to be low, with the major fish spawning and migration routes occurring inshore on the shelf. The dominant fish in the area would include the migratory large pelagic species such as tunas, billfish and pelagic sharks. Seabirds will be dominated by the pelagic species such as albatross, petrels and shearwaters. Migrating turtles in the area would include the leatherback and loggerhead turtles. Marine mammals likely to occur offshore include a variety of baleen whales including humpbacks, Antarctic minke, fin and sei whales. Toothed whales will include sperm and killer whales, as well as a variety of beaked whales and dolphins. There are six offshore Marine Protected Areas (MPAs) in the general project area but none fall within the Reconnaissance Permit Area. The Application Area lies well offshore of these MPAs. There is some overlap of the Reconnaissance Permit Area with the Orange Seamount and Canyon Complex Ecologically and Biologically Significant Areas (EBSAs). Critical biodiversity areas (CBAs) within the Reconnaissance Permit area include both CBA1 (natural) and CBA2 (natural areas), with a small section of CBA2 (restore) being located in the north.

Potential impacts to the marine fauna as a result of the proposed 3D seismic acquisition include:

- Physiological injury and/or mortality;
- Behavioural avoidance;
- Reduced reproductive success/spawning;
- Masking of environmental sounds and communication;
- Collision of turtles/marine mammals with the survey and support vessels or entanglement in towed acoustic apparatus; and
- Indirect impacts on piscivorous predators due to seismic effects on prey species.

The highest sensitivities in response to the proposed 3D surveys are:

- Humpback whales, which migrate through the area between June and November (inclusive);
- Sperm whales, beaked whales and other odontocetes that frequent offshore waters;
- Large migratory pelagic fish and shark species that show seasonal association with Child's Bank and Tripp Seamount;
- Leatherback turtles which frequent offshore waters in low numbers and aggregate around seamounts to feed on jellyfish; and
- Various pelagic Albatross, Petrel, Storm Petrel and Shearwater species.

If all environmental guidelines, and appropriate mitigation measures recommended in this report are implemented, there is no reason why the proposed seismic survey programme should not proceed. It should also be kept in mind that some of the migratory species are now present year round off the West Coast, and that certain baleen and toothed whales are resident and/or show seasonality opposite to the majority of the baleen whales. Data collected by independent onboard observers should form part of a survey close-out report to be forwarded to the necessary authorities, and any incidence data and seismic source output data arising from surveys should be made available for analyses of survey impacts in Southern African waters.

FISHERIES ASSESSMENT

The potential impacts of the seismic survey programme on fisheries relate to :

- Exclusion of fishing vessels from accessing fishing ground;
- the impact on catch rates as a result of increased noise levels associated with the seismic survey operation;
- accidental loss of equipment from the survey array; and
- accidental release of marine diesel at sea.

Under the Convention on the International Regulations for Preventing Collisions at Sea (COLREGS, 1972, Part A, Rule 10), a seismic survey vessel that is engaged in surveying is defined as a "vessel restricted in its ability to manoeuvre" which requires that power-driven and sailing vessels give way to a vessel restricted in her ability to manoeuvre. Furthermore, under the Marine Traffic Act, 1981 (No. 2 of 1981), a vessel used for the purpose of exploiting the seabed falls under the definition of an "offshore installation" and as such it is protected by a 500m safety zone. It is an offence for an unauthorised vessel to enter the safety zone. In addition to a statutory 500 m safety zone, a seismic contractor would request a safe operational limit (that is greater than the 500 m safety zone) that it would like other vessels to stay beyond. Safety clearances for seismic surveys are usually 6 Nm ahead and astern and 2 Nm to either side of the survey vessel, resulting in an exclusion area of approximately 165 km^2 around the survey vessel. The temporary exclusion of fisheries from the safety zone may reduce access to fishing grounds, which in turn could potentially result in a loss of catch and/or displacement of fishing effort (direct negative impact). The safety zone would be implemented around the seismic vessel for the duration of the project, resulting in an immediate impact that would endure for the duration of the proposed survey (~70 days). The impact of exclusion from fishing ground was assessed on each fishing sector based on the type of gear used and the proximity of fishing areas relative to the Reconnaissance Permit area. With the implementation of the project controls and mitigation measures, the residual impact of the proposed survey is of LOW NEGATIVE significance to large pelagic longline and tuna pole-line sectors. There is no impact expected on the demersal trawl, midwater trawl, demersal longline, small pelagic purse-seine, linefish, west coast rock lobster, netfish and small-scale fishing sectors.

The impact on catch rates due to sound elevation levels was assessed and sensitivity/vulnerability differences amongst the targeted fish species identified for each sector. Sound generated during the proposed seismic survey is expected to be in the order of 255 dB re 1 µPa at 1 m at an operating frequency range of 5 – 300 Hz. This falls within the hearing range of most fish species. A sound transmission loss modelling study (SLR 2021) identified predicted zones of impact for fish species (amongst other marine fauna species of concern) based on relevant noise impact assessment criteria. The noise effects assessed included physiological effects (PTS) and TTS) and behavioural disturbance due to either immediate impact from single airgun pulses or cumulative effects of exposure to multiple airgun pulses over a period of 24 hours. Based on the current project description, sound levels for the seismic survey could notionally be expected to attenuate to below levels for behavioural disturbance at a distance of 4 km from the source. The spatial extent of the impact of sound (produced by the airgun array) on catch rates is expected to be regional, although localised at any one time. The impact is considered to be of immediate duration and reversible without additional time or cost. Based on the distance of fishing grounds from the Reconnaissance Permit area, only the large pelagic longline and tuna pole-line sectors are considered to be susceptible to the effects of elevated sound. With the implementation of the project controls and mitigation measures, the residual impact due to seismic noise is considered to be of LOW NEGATIVE

significance. There is no impact expected on the demersal trawl, midwater trawl, demersal longline, small pelagic purse-seine, linefish, west coast rock lobster, netfish and small-scale fishing sectors.

The Reconnaissance Permit area is situated in the Orange Basin, offshore of the shelf break and offshore of grounds of importance for many of South Africa's commercial fishing sectors, as well as small-scale and recreational fisheries. The large pelagic longline sector operates across the extent of the Reconnaissance Permit area, with activity focussed along the continental shelf break. The Application Area does not overlap key spawning or nursery areas therefore the risk of noise disturbance to spawning behaviour and fishery recruitment is considered unlikely.

In order to mitigate the impacts on the large pelagic longline sector, it is recommended that the survey avoid taking place during June and July. Prior to the commencement of survey activities, affected parties should be informed of the navigational co-ordinates of the proposed survey acquisition area, timing and duration of proposed activities and any implications relating to the safety zone that would be requested, as well as the movements of support vessels related to the project. The relevant fishing associations include FishSA, SA Tuna Association, SA Tuna Longline Association and Fresh Tuna Exporters Association.

Other key stakeholders should be notified prior to commencement and on completion of the survey. These include; Department of Forestry, Fisheries and the Environment (DFFE), the South African Navy Hydrographic Office (SANHO), South African Maritime Safety Association (SAMSA) and Ports Authorities. For the duration of the survey, a navigational warning should be broadcast to all vessels via Navigational Telex (Navtext) and Cape Town radio. In addition, it is recommended that updates of the scheduled weekly survey plan should be circulated to the operators of affected fishing vessels on a daily basis. A Fisheries Liaison Officer (FLO) should be present on board the seismic vessel or escort vessel for the duration of the survey in order to facilitate communications between the seismic and fishing vessels in the project area.

It is the reasoned opinion of the specialist that the reconnaissance activities may be authorised, subject to the implementation of the mitigation measures proposed.

HERITAGE ASSESSMENT

The scientific studies conducted for this project identified impacts on fishing stock as low for all species. By inference, a potential impact (albeit low) on fishing yield could be expected and thus potential economic impact on communities due to reduced caught fish volumes. The recommended mitigation measures, as listed in the specialist reports for the project, focus on the reduction of impacts on fish species and the projected reduction of the impact on the commercial and small-scale fishery catch yield. These mitigation measures should then indirectly positively impact the potential negative impacts on the cultural heritage of the communities to be impacted.

The cultural heritage and living heritage related to the communities linked to fisheries and ocean subsistence and further identifying as indigenous communities can potentially be impacted by the proposed project. A pre-mitigation negative impact on a regional scale over the long term with a moderate intensity due to the potential indirect impact on the communities and, ultimately, their heritage, with a high probability of this impact occurring. The pre-mitigation impact on heritage resources is rated as MEDIUM. The potential residual impact on heritage resources, with mitigation measures from the scientific studies, is projected as LOW with a medium confidence factor.

Considering the assessment based on the findings of the fieldwork as well as the scientific studies relating to the impact on fisheries, the specialist is of the opinion that the impact of the proposed project on the cultural heritage resources can be mitigated through the implementation of the recommendations in this report.

SOCIAL ASSESSMENT

TGS's activities for this application would be of short duration if approved, and if viewed in isolation considering only technical risks as discussed in various specialist reports conducted as part of the EIA process, the impacts will be negligible. However, communities feel that there are significant gaps in the available data and from a social perspective the non-technical or social risks can potentially cause significant impacts. Although the marine fauna and fisheries specialists have indicated that the impacts on the marine fauna would be negligible, the

communities, with generations of experience in the ocean, fear that the behaviour of the fish will change and that this would affect their catch rates and consequently their livelihoods. What is seen as a minor impact in a large ecosystem may be experienced as a major impact by an individual. The marine fauna might not be affected greatly, but the fishing community fear that marine fauna might change its behaviour in response and that is a main concern from a social perspective.

Another concern is the cumulative impact of activities in the ocean where these communities earn their livelihoods. Their fears about the tipping point where their source of livelihood does not recover from all the activities in the ocean, and they are no longer able to make their livelihood as fishing communities must be considered. Currently these communities are able to sustain themselves, although it is difficult. The communities are not against development, but they want to see it happen in a sustainable way that does not jeopardise their source of livelihood. They have already seen how their livelihoods are being affected by mining that is taking place in the sea, pollution, climate change, overfishing and businesses such as factories that come and go and often and do not leave in a socially responsible way.

TGS, as well as other companies that want to do surveys or exploration in the area, currently do not have social license to operate. A large part of this is due to a lack of meaningful consultation by previous applicants from a community perspective. If TGS or any other seismic survey company wants to proceed with the project, they will need to engage in meaningful conversation with the communities and try to restore relationships. From a community and social risk perspective this is not negotiable.

Seismic reconnaissance projects are controversial in South Africa and have been in the news frequently in the last year. For many stakeholders it is an emotional matter, for others the potential of impacting their livelihoods is the biggest fear. There are also stakeholders that feel that the exploration for fossil fuels is not in line with sustainable development and the fight against climate change. Other stakeholders feel that it is imperative for the growth and development of the South African economy to engage in these investigations.

From a social perspective it is clear that the communities and majority of local people are opposed to the project. If the project is considered in isolation, the impacts are negligible. However, the project does not happen in a vacuum, and the social environment is much wider than the footprint of the project. If the social risks and potential damage to cultural and indigenous rights are considered the impact on the social fabric of already vulnerable communities may be significant. At this stage communities feel that they cannot make informed decisions. Although all legal processes have been followed, the seismic survey industry is not moving at the pace of the community, and in the long run this will be detrimental to the industry. Potential future benefits and the economic development of the country should the surveys find any significant resources are not disputed. From a social perspective it is recommended that the project proceed subject to the mitigation measures (i.e. meaningful consultation, local research, education, and awareness raising in the project-affected communities) forming part of the conditions for authorisation and being implemented prior to the commencement of the actual survey.

IMPACT STATEMENT

The findings of the specialist studies conclude that there are no environmental fatal flaws that should prevent the proposed project from proceeding, provided that the recommended mitigation and management measures are implemented. Based on the nature and extent of the proposed project, the level of disturbance predicted as a result of the survey activities, the findings of the specialist studies, and the understanding of the significance level of potential environmental impacts, it is the opinion of the EIA project team and the EAP that the significance levels of the majority of identified negative impacts can generally be reduced to an acceptable level by implementing the recommended mitigation measures and the project should be authorised.

Some of the key critical mitigation measures are listed below (more detail is provided in Section 11 of this report):

- Plan seismic surveys to avoid sensitive areas and periods for some marine fauna: Movement of migratory cetaceans (particularly baleen whales) from their southern feeding grounds into low latitude waters (June/July and late October/November), and their aggregation on the summer feeding grounds between St Helena Bay and Dassen Island from late October to late December and ensure that

migration paths are not blocked by seismic operations. If possible, the survey should be undertaken from North to South to avoid these feeding aggregations;

- Although a seismic vessel and its gear may pass through a declared Marine Protected Area, acoustic sources must not be operational during this transit;
- Ensure the seismic vessel is fitted with Passive Acoustic Monitoring (PAM) technology, which detects some animals through their vocalisations;
- Define and enforce the use of the lowest practicable seismic source volume for production, and design arrays to maximise downward propagation, minimise horizontal propagation and minimise high frequencies in seismic source pulses;
- Ensure that 'turtle-friendly' tail buoys are used by the survey contractor or that existing tail buoys are fitted with either exclusion or deflector 'turtle guards';
- Ensure that solid streamers rather than field-filled streamers are used to avoid leaks;
- Make provision for the placing of qualified Marine Mammal Observers (MMOs) on board the seismic vessel;
- Maintain a pre-acquisition watch of 60-minutes before any instances of seismic source testing. If only a single lowest power seismic source is tested, the pre- acquisition watch period can be reduced to 30 minutes;
- Implement a "soft-start" procedure in certain identified scenarios or if testing multiple seismic sources;
- Implement a dedicated MMO and PAM pre- acquisition watch of at least 60 minutes (to accommodate deep-diving species in water depths greater than 200 m);
- Terminate seismic source on observation and/or detection of penguins or feeding aggregations of diving seabirds, turtles, slow swimming large pelagic fish (including whale sharks, basking sharks, manta rays) or cetaceans within the 500 m mitigation zone;
- Terminate seismic source on observation of any obvious mortality or injuries to cetaceans, turtles, seals or mass mortalities of squid and fish (specifically large shoals of tuna or surface shoaling small pelagic species such as sardine, anchovy and mackerel) when estimated by the MMO to be as a direct result of the survey;
- Avoid operating during June and July, in order to avoid periods of peak fishing effort by the large pelagic longline sector;
- Prior to the commencement of seismic survey activities the key stakeholders should be consulted and informed of the proposed seismic survey programme;
- An experienced FLO should be placed on board the seismic or guard vessel to facilitate communications with fishing vessels in the vicinity of the seismic survey areas;
- Notify any fishing vessels at a radar range of 12 nm from the seismic vessel via radio regarding the safety requirements around the seismic vessel;
- Implement a grievance mechanism in case of disruption to fishing or navigation;
- Re-assess post project, the effects on the identified communities and their intangible cultural heritage as well as of related economic damage and losses, and human development impacts. Based on the outcomes, provide resources and support for communities to develop and undertake safeguarding measures or plans to enhance the mitigation capacity of their intangible cultural heritage by fostering dialogue, mutual understanding and reconciliation between and within communities. It is anticipated that this can be achieved through the implementation of the mitigation measures in the Social Impact Assessment.

5/08

- TGS should develop a community engagement protocol that is based on the San Code of Research Ethics. This should be done in consultation with the affected communities. This should include a communication strategy and grievance mechanism.
- TGS should contribute to assisting with collaboration on independent research on how fish species on the West Coast such as snoek respond to seismic surveying. TGS will further contact relevant scientific research institutions to offer the potential of collaborating in independent on-water research during the survey.
- Baseline noise measurements can provide useful information (prior to operations) when interpreting underwater noise predictions for the introduction of a new noise source. As such, it is recommended that underwater noise measurements be implemented that would include the deployment of underwater sound monitoring equipment to establish an actual baseline prior to the commencement of the survey and then operational levels of noise during the survey.
- Consult with communities on potential ways in which to make a positive contribution to the communities.

1 INTRODUCTION

TGS Geophysical Company (UK) (hereafter TGS) has applied for Environmental Authorization for a 3D seismic survey off the West Coast of South Africa. Environmental Impact Management Services (Pty) Ltd (EIMS) has been appointed by TGS to prepare and submit an application for Environmental Authorisation (EA) as per the requirements of the Environmental Impact Assessment (EIA) Regulations, 2014, as amended, promulgated under the National Environmental Management Act (Act No. 107 of 1998- NEMA) and the requirements of the Minerals and Petroleum Resources Development Act (Act No. 28 of 2002 – MPRDA).

The proposed project area is located between approximately 120 km offshore of St Helena Bay (closest point), extending north along the western coastline to approximately 230 km offshore of Hondeklip Bay over a number of petroleum licence blocks. The Application Area for the proposed 3D seismic survey is approximately 57 400 km^2 in extent. It is proposed that a single survey vessel equipped with seismic sources and streamers be used. The proposed 3D survey would be supported by up to two escort vessels. The 3D survey will take in the order of 70 days including downtime.

A Basic Assessment (BA) process is being undertaken to accompany the application for the EA Listing Notices listed activities applicable to the project namely:

- GN985, Listing Notice 1: Activity 21(b): Any activity including the operation of that activity which requires a reconnaissance permit in terms of section 74 of the Mineral and Petroleum Resources Development Act, as well as any other applicable activity as contained in this Listing Notice or in Listing Notice 3 of 2014, required to exercise the reconnaissance permit, excluding –

  (a) any desktop study; and

  (b) any aeial survey.

The Application Area corner coordinate points are listed in Table 1 below. Close towns or points of interest include Cape Town, Hout Bay, Saldanha, Lamberts Bay, Hondeklip Bay and Port Nolloth.

Table 1: Application Area Corner Coordinate Points

Point	Latitude	Longitude	Point	Latitude	Longitude
1	32°59'53.46"S	16°35'02.75"E	6	30°40'16.36"S	13°20'38.26"E

1.1 REPORT STRUCTURE

This report has been compiled in accordance with the NEMA EIA Regulations, 2014, as amended. A summary of the report structure, and the specific sections that correspond to the applicable regulations, is provided in Table 2 below.

Table 2: Report structure

Environmental Regulation	Description – NEMA Regulation 982 (2014) as amended	Section in Report
Appendix 3(1)(a)	Details of – i. The Environmental Assessment Practitioner (EAP) who prepared the report; and ii. The expertise of the EAP, including a curriculum vitae;	1.2
Appendix 3(1)(b)	The location of the activity, including – i. The 21-digit Surveyor General code of each cadastral land parcel; ii. Where available, the physical address and farm name; iii. Where the required information in items (i) and (ii) is not available, the coordinates of the boundary of the property or properties;	2
Appendix 3(1)(f	A plan which locates the proposed activity or activities applied for at an appropriate scale, or, if it is – i. A linear activity, a description and coordinates of the corridor in which the proposed activity or activities is to be undertaken; or ii. On a land where the property has not been defined, the coordinates within which the activity is to be undertaken;	2
Appendix 3(1)(d)	A description of the scope of the proposed activity, including – i. All listed and specified activities triggered and being applied for; and ii. A description of the associated structures and infrastructure related to the development;	3
Appendix 3(1)(	A description of the policy and legislative context within which the development is proposed including:	4

Environmental Regulation	Description – NEMA Regulation 982 (2014) as amended	Section in Report
	i. an identification of all legislation, policies, plans, guidelines, spatial tools, municipal development planning frameworks, and instruments that are applicable to this activity and have been considered in the preparation of the report; and ii. how the proposed activity complies with and responds to the legislation and policy context, plans, guidelines, tools frameworks, and instruments	
Appendix 3(1)(f)	A motivation for the need and desirability for the proposed development including the need and desirability of the activity in the context of the preferred location;	5
Appendix 3(1)(g)	A motivation for the preferred site, activity and technology alternative	6, 8 and 9
Appendix 3(1)(h)	A full description of the process followed to reach the proposed preferred alternative within the site, including: – i. Details of the development footprint alternatives considered; ii. Details of the public participation process undertaken in terms of regulation 41 of the Regulations, including copies of the supporting documents and inputs; iii. A summary of the issues raised by interested and affected parties, and an indication of the manner in which the issues were incorporated, or the reasons for not including them; iv. The environmental attributes associated with the alternatives focusing on the geographical, physical, biological, social, economic, heritage and cultural aspects; v. The impacts and risks identified for each alternative, including the nature, significance, consequence, extent, duration and probability of the impacts, including the degree to which these impacts – a. Can be reversed; b. May cause irreplaceable loss or resources; and c. Can be avoided, managed or mitigated; vi. The methodology used in determining and ranking the nature, significance, consequences, extent, duration and probability of potential environmental impacts and risks associated with the alternatives;	6, 7, 8 and 9

Environmental Regulation	Description – NEMA Regulation 982 (2014) as amended	Section in Report
	vii. Positive and negative impacts that the proposed activity and alternatives will have on the environment and on the community that may be affected focusing on the geographical, physical, biological, social, economic, heritage and cultural aspects; viii. The possible mitigation measures that could be applied and level of residual risk; ix. The outcome of the site selection matrix; x. If no alternatives, including alternative locations for the activity were investigated, the motivation for not considering such; and; xi. A concluding statement indicating the preferred alternatives, including preferred location of the activity.	
Appendix 3(1)(h)	A full description of the process undertaken to identify, assess and rank the impacts the activity will impose on the preferred location through the life of the activity, including – i. A description of all environmental issues and risks that were identified during the environmental impact assessment process; and ii. An assessment of the significance of each issue and risk and an indication of the extent to which the issue and risk could be avoided or addressed by the adoption of mitigation measures;	6, 7, 8 and 9
Appendix 3(1)(i)	An assessment of each identified potentially significant impact and risk, including – i. Cumulative impacts; ii. The nature, significance and consequences of the impact and risk; iii. The extent and duration of the impact and risk; iv. The probability of the impact and risk occurring; v. The degree to which the impact and risk can be reversed; vi. The degree to which the impact and risk may cause irreplaceable loss of resources; and vii. The degree to which the impact and risk can be mitigated;	6, 7, 8 and 9

Environmental Regulation	Description – NEMA Regulation 982 (2014) as amended	Section in Report
Appendix 3(1)(k)	Where applicable, a summary of the findings and impact management measures identified in any specialist report complying with Appendix 6 to these Regulations and an indication as to how these findings and recommendations have been included in the final report;	11
Appendix 3(1)(l)	An environmental impact statement which contains – I. A summary of the key findings of the environmental impact assessment; II. A map at an appropriate scale which superimposes the proposed activity and its associated structures and infrastructure on the environmental sensitivities of the preferred site indicting any areas that should be avoided, including buffers; and III. A summary of the positive and negative impacts and risks of the proposed activity and identified alternatives;	11.1 11.2 11.3 11.4
Appendix 3(1)(m)	Based on the assessment, and where applicable, recommendations from specialist reports, the recording of proposed impact management outcomes for the development for inclusion in the EMPr;	11.4
Appendix 3(1)(n)	Any aspects which were conditional to the findings of the assessment either by the EAP or specialist which are to be included as conditions of authorisation;	11.2
Appendix 3(1)(o)	A description of any assumptions, uncertainties and gaps in knowledge which relate to the assessment and mitigation measures proposed;	12
Appendix 3(1)(p)	A reasoned opinion as to whether the proposed activity should or should not be authorised, and if the opinion is that it should be authorised, any conditions that should be made in respect of that authorisation;	11
Appendix 3(1)(q)	Where the proposed activity does not include operational aspects, the period for which the environmental authorisation is required and the date on which the activity will be concluded and the post construction monitoring requirements finalised;	N/A
Appendix 3(1)I	An undertaking under oath or affirmation by the EAP in relation to – iv. The correctness of the information provided in the reports; v. The inclusion of comments and inputs from stakeholders and interested and affected parties;	13

276

Environmental Regulation	Description – NEMA Regulation 982 (2014) as amended	Section in Report
	vi. The inclusion of inputs and recommendations from the specialist reports where relevant; and vii. Any information provided by the EAP to interested and affected parties and any responses by the EAP to comments or inputs made by interested or affected parties;	
Appendix 3(1)(t)	Any specific information that may be required by the competent authority; and	None
Appendix 3(1)(u)	Any other matters required in terms of section 24(4)(a) and (b) of the Act.	None

1.2 DETAILS OF THE EAP

EIMS has been appointed by TGS as the Independent Environmental Assessment Practitioner (EAP) to prepare and submit the EA application, Basic Assessment Report, and undertaking a Public Participation Process (PPP) to accompany the Reconnaissance Permit Application. The contact details of the EIMS consultant's and EAP's who compiled this Report are as follows:

- Name: GP Kriel (compiler)/ Liam Whitlow (Reviewer)
- Tel No: +27 11 789 7170
- Fax No: +27 86 571 9047
- E-mail address: tgs@eims.co.za

In terms of Regulation 13 of the EIA Regulations, 2014, as amended, an independent EAP, must be appointed by the applicant to manage the application. EIMS is compliant with the definition of an EAP as defined in Regulations 1 and 13 of the EIA Regulations, as well as Section 1 of the NEMA. This includes, inter alia, the requirement that EIMS is:

- Objective and independent;
- Has expertise in conducting EIA's;
- Comply with the NEMA, the environmental regulations and all other applicable legislation;
- Considers all relevant factors relating to the application; and
- Provides full disclosure to the applicant and the relevant environmental authority.

EIMS is a private and independent environmental management-consulting firm that was founded in 1993. EIMS has in excess of 29 years' experience in conducting EIA's. Please refer to the EIMS website (www.eims.co.za) for further details of expertise and experience.

GP holds an M.Env.Sci (Water Sciences) Cum Laude from the North-West University (Potchefstroom Campus) and has been employed as an Environmental Consultant since 2007. GP is a Registered Professional Natural Scientist (South African Council for Natural and Scientific Professions) and a Registered Environmental Assessment Practitioner (Environmental Assessment Practitioners Association of South Africa). He has delivered presentations locally and internationally concerning the use of bio-indicators for the determination of water quality, and has experience in a wide variety of environmental management projects including: Environmental Impact Assessments, Basic Assessments, Geographic Information Systems (GIS), Environmental Compliance Monitoring, Environmental Awareness Training, Aquatic Ecological Assessments, Drinking and Waste Water Treatment Process Audits, Wetland Delineation and Assessments, ISO 14001 Aspect Registers, Water Use Licence Applications, Waste Management Licence Applications, Integrated Waste and Water Management Plans (IWWMP) and Green House Gas Assessments.

Liam holds a B. Sc. Hons degree in Environmental Management and has completed an additional B. Sc. honours course in applied limnology. In addition, he has completed a higher certificate in Project Management with Damelin Business School and a course on ISO14001 Auditing Principles and Environmental Management Systems Auditor Training. Liam is a registered professional natural scientist with the South African Council for Natural Scientific Professions. Liam's professional experience, gained over more than 21 years, lies mainly with environmental impact assessments including project managing significantly large EIA's in the mining and infrastructure sectors. Liam's other experience includes ISO14001, Site Assessments, Water-use licensing, Environmental monitoring, and Environmental Management Plans. Liam's experience lies mainly within South Africa, but he has been involved in projects in both Lesotho and Botswana.

The Curriculum Vitae of the EAP responsible for the compilation of this Report is included in Appendix 1.

1.3 SPECIALIST CONSULTANTS

Specialist studies have been undertaken to address the key impacts that require further investigation, and these include:

- Acoustic Technical Report – SLR Consulting Australia (Pty) Ltd;
- Marine Ecological Assessment – Pisces Environmental Services (Pty) ltd;
- Fisheries Assessment – undertaken by CapMarine (Pty) Ltd;
- Heritage Assessment – PGS Heritage (Pty) Ltd; and
- Social Assessment – Equispectives Research and Consulting Services (Pty) Ltd.

The specialist studies involved the gathering of data relevant to identifying and assessing environmental impacts that may occur as a result of the proposed project. These impacts were assessed according to pre-defined impact rating methodology (Section 9.1). Mitigation / management measures to minimise potential negative impacts or enhance potential benefits are put forward in this BA Report. The specialist reports that informed this BA report are included in Appendix 3.

2 DESCRIPTION OF THE PROJECT AREA

Table 3 indicates the details of the project area for the proposed project including details on the project location as well as the distance from the proposed project area to the nearest towns.

Table 3: Locality details

Project Area	The proposed project area is located between approximately 120 km offshore of St Helena Bay, extending north along the western coastline to approximately 230 km offshore of Hondeklip Bay over a number of petroleum licence blocks.
Application Area	Proposed 3D Seismic Application Area: approximately 57 400 km^2 in extent.
Magisterial District	Adjacent to the Namakwaland and West Coast District Municipalities.
District Municipality	Adjacent to the Namakwaland and West Coast District Municipalities.
Local Municipalities	Adjacent to various local municipalities: • City of Cape Town; • Cederberg Local Municipality; • Saldanha Bay Local Municipality; • Bergrivier Local Municipality; • Swartland Local Municipality; • Nama Khoi Local Municipality; • Kamiesberg Local Municipality; • Richtersveld Local Municipality; and • Matzikama Local Municipality.
Petroleum License Blocks Covered by Application Area	The following license blocks are covered by the application area: • 12/3/274 ER; • 12/3/348 ER; • 12/3/939 ER; • 12/3/248 ER; and • Open area.

The locality of the proposed Application Area is shown in Figure 1. The proposed project area is located between approximately 120 km offshore of St Helena Bay, extending north along the western coastline to approximately 230 km offshore of Hondeklip Bay over a number of petroleum licence blocks. The Application Area for the proposed 3D seismic survey is approximately 57 400 km^2 in extent.

3 DESCRIPTION OF THE PROPOSED ACTIVITY

Seismic survey programmes comprise of data acquisition in either two-dimensional (2D) and/or three-dimensional (3D) scales, depending on information requirements. 2D surveys are typically applied to obtain regional data from widely spaced survey grids and provide a vertical profile through the subsurface, highlighting geophysical, geological information and features along the seismic-line. Infill surveys on closer grids subsequently provide more detail over specific areas of interest. In contrast, 3D seismic surveys are conducted on a very tight survey grid spacing in specific target areas, often identified during 2D applications, providing a cube image of the subsurface geology within the survey volume. The current proposed seismic survey as discussed in this report is a 3D seismic survey and does not include any provision for exploration drilling.

During seismic surveys high-level, low frequency sound pulses are generated by an acoustic instrument towed behind a survey vessel, just below the sea surface. The sounds are directed towards the seabed and the seismic signal is reflected by the geological interfaces below the seafloor. The reflected signals are received by an array of receivers or sets of hydrophones towed behind the vessel in a single streamer (2D) or in multiple streamers (3D) and are fed back to the recording instruments on board. The spacing between the hydrophone groups is commonly 25 m or shorter, depending on the purpose of the seismic survey. Each group contains many hydrophones, spaced less than 1 m apart. The hydrophone streamers must be towed at constant depth (6 – 10 m), with flotation usually achieved by filling the cables with kerosene, gel or flexible polymer foam, so that they are neutrally buoyant. To compensate for minor adjustments, Automatic Cable Levellers, or "birds" are used. The ends of the hydrophone streamers are marked with tail buoys, to warn shipping about the presence of the cable in the water. The tail buoys also act as a platform for surface positioning systems so that the cable locations can be accurately monitored. Refer to Figure 3, Figure 4 and Figure 5 for illustrative examples of typical survey vessel, equipment and activities.

Figure 3: Example of seismic survey vessel and associated equipment (FishSAFE, 2021).

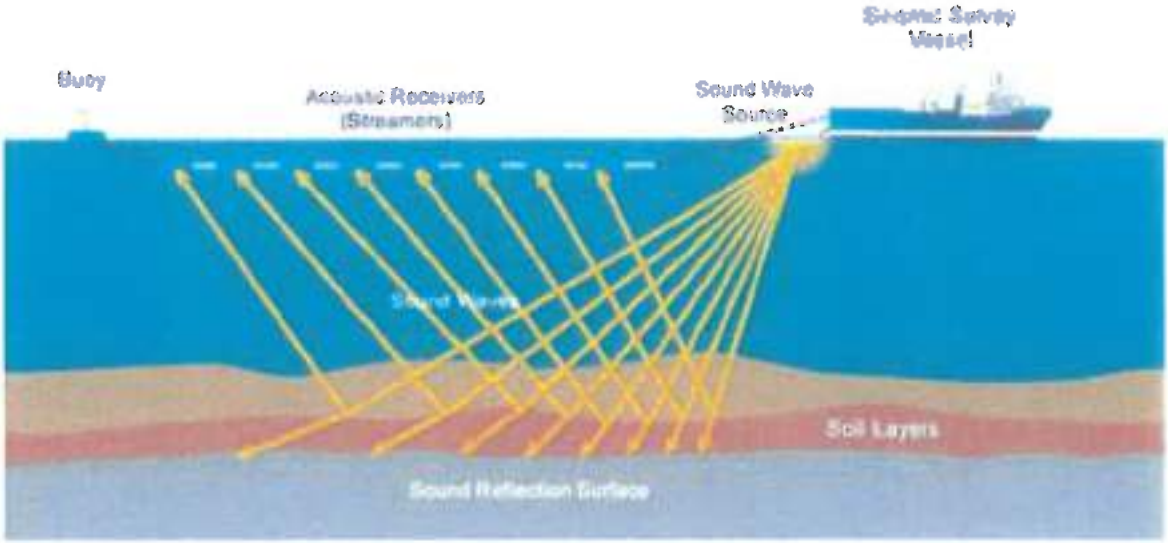

Figure 4: Example demonstration of seismic survey activities (Fish SAFE, 2021).

Figure 5: Schematic diagram showing side-view of the seismic source array and hydrophone cable ("streamer")

While acquiring the seismic data, the survey vessel would travel along transects of a prescribed grid within the Application Area that have been chosen to cross any known or suspected geological structure in the area. The vessel typically travels at a speed of between four and six knots (i.e. 2 to 3 meters per second / 7.2 to 10.8 kilometres per hour) while surveying. The survey vessel length is approximately 100 m.

The proposed survey would involve a seismic sound source and multiple hydrophone streamers, which would be approximately 8 000 m long and 2 000 m wide. The streamers would be towed at a depth of 8 m below the surface and would not be visible, except for the tail-buoy at the terminal end of the cable. The array has an operating pressure of 2 000 pounds per square inch. The sound source would be towed behind the vessel at a depth of between 5 – 25 m below the surface. As the survey vessel would be restricted in manoeuvrability, other vessels should remain clear of it and therefore a support vessel usually assists in the operation of keeping other vessels at a safe distance.

Each triggering of a sound source is termed a seismic pulse, and these are discharged at intervals of 6 – 20 seconds (depending on water depth and other environmental characteristics). Each seismic pulse is usually only between 5 and 30 milliseconds in duration, and despite peak levels within each pulse being high, the total energy delivered into the water is low. Seismic sources have most of their energy in the 5-300 Hz frequency range, with the optimal frequency required for deep penetration seismic work being 50-80 Hz.

Sound levels from individual sound sources used today in the seismic industry range from 200 to 255 dB re 1 µPa at 1 m, for small to large individual seismic sources, respectively. For sound source arrays, sound levels range from 235 dB re 1 µPa at 1 m for a small array (500 cubic inches) to 260 dB re 1 µPa at 1 m for large arrays (7 900 cubic inches). The majority of the produced energy is below 250 Hz, with 90% of the energy between 70 to 140 Hz, although pulses do contain some higher frequencies up to 16 kHz. It must be noted, however, that the sound level specifications for sound source arrays refer to sound levels in the vertical direction directly beneath the sound source array, generally near its centre, with nominal sound levels in the horizontal direction being ~10-20 dB lower.

4 POLICY AND LEGISLATIVE CONTEXT

This section provides an overview of the governing legislation identified which relates to the proposed project. Additional legislation and other guidelines and policies are discussed in Table 5 below.

4.1 CONSTITUTION OF THE REPUBLIC OF SOUTH AFRICA

The constitution of any country is the supreme law of that country. The Bill of Rights in chapter 2 section 24 of the Constitution of South Africa Act (Act No. 108 of 1996) makes provisions for environmental issues and declares that: *"Everyone has the right –*

a) to an environment that is not harmful to their health or well-being; and

b) to have the environment protected, for the benefit of present and future generations, through reasonable legislative and other measures that:

i. prevent pollution and ecological degradation;

ii. promote conservation; and

iii. secure ecologically sustainable development and use of natural resources while promoting justifiable economic and social development"

The BA and associated impact mitigation actions are conducted to fulfil the requirement of the Bill of Rights.

4.2 THE MINERAL AND PETROLEUM RESOURCES DEVELOPMENT ACT

The aim of the MPRDA is to *"make provision for equitable access to and sustainable development of the nation's mineral and petroleum resources"*. The MPRDA outlines the procedural requirements that need to be met to acquire mining rights in South Africa. Further to an Acceptance Letter of Reconnaissance Permit (Ref: 12/1/040) dated 15 December 2021 from PASA (and the subsequent extension letters dated 10 February 2022 and 19 May 2022, TGS must apply for Environmental Authorisation in terms of NEMA for any activities requiring a reconnaissance permit as per Section 74 of the MPRDA.

Several amendments have been made to the MPRDA. These include, but are not limited to, the amendment of Section 102, concerning amendment of rights, permits, programmes and plans, to requiring the written permission of the Minister for any amendment or alteration; and the section 5A) requirement that landowners or land occupiers receive twenty-one (21) days' written notice prior to any activities taking place on their properties. One of the most recent amendments requires all mining related activities to follow the NEMA process as per the EIA Regulations, 2014, which came into effect on 4 December 2014.

4.3 THE NATIONAL ENVIRONMENTAL MANAGEMENT ACT

The main aim of the National Environmental Management Act, 1998 (Act 107 of 1998 – NEMA) is to provide for co-operative governance by establishing decision-making principles on matters affecting the environment. In terms of the NEMA EIA Regulations, the applicant is required to appoint an EAP to undertake the EIA process, as well as conduct the public participation process towards an application for EA. In South Africa, EIA's became a legal requirement in 1997 with the promulgation of regulations under the Environment Conservation Act (ECA). Subsequently, NEMA was passed in 1998. Section 24(2) of NEMA empowers the Minister and any MEC, with the concurrence of the Minister, to identify activities which must be considered, investigated, assessed and reported on to the competent authority responsible for granting the relevant EA. On 23 April 2006, the Minister of Environmental Affairs and Tourism (now Department of Environment, Forestry and Fisheries – DFFE) promulgated regulations in terms of Chapter 5 of the NEMA. These regulations, in terms of the NEMA, were amended in June 2010 and again in December 2014 as well as April 2017. The NEMA EIA Regulations, 2014, as amended, are applicable to this project. Exploration activities officially became governable under the NEMA EIA Regulations in December 2014 with the competent authority identified as the DMRE.

The objective of the EIA Regulations is to establish the procedures that must be followed in the consideration, investigation, assessment and reporting of the listed activities that are triggered by the proposed project. The

purpose of these procedures is to provide the competent authority with adequate information to make informed decisions which ensure that activities which may impact negatively on the environment to an unacceptable degree are not authorised, and that activities which are authorised are undertaken in such a manner that the environmental impacts are managed to acceptable levels.

In accordance with the provisions of Sections 24(5) and Section 44 of the NEMA the Minister has published Regulations (GN R. 982) pertaining to the required process for conducting EIA's in order to apply for, and be considered for, the issuing of an EA. These EIA Regulations provide a detailed description of the EIA process to be followed when applying for EA for any listed activity.

In terms of these regulations a Basic Assessment process is required for the proposed project. The Table 4 below identifies the listed activities the proposed project triggers and consequently requires authorisation prior to commencement.

Table 4: NEMA listed activities to be authorised

Activity	Activity Description	Applicability
Listing Notice 1 Activity 21(b)	Any activity including the operation of that activity which requires a reconnaissance permit in terms of section 74 of the Mineral and Petroleum Resources Development Act, as well as any other applicable activity as contained in this Listing Notice or in Listing Notice 3 of 2014, required to exercise the reconnaissance permit, excluding- (a) any desktop study; and (b) any arial survey	The undertaking of 3D survey reconnaissance activities requires a reconnaissance permit in terms of section 74 of the Mineral and Petroleum Resources Development Act.

4.4 THE NATIONAL HERITAGE RESOURCES ACT

The National Heritage Resources Act (Act 25 of 1999 – NHRA) stipulates that cultural heritage resources may not be disturbed without authorisation from the relevant heritage authority. Section 34(1) of the NHRA states that, *"no person may alter or demolish any structure or part of a structure which is older than 60 years without a permit issued by the relevant provincial heritage resources authority..."* The NHRA is utilised as the basis for the identification, evaluation and management of heritage resources and in the case of Cultural Resource Management (CRM) those resources specifically impacted on by development as stipulated in Section 38 of NHRA, and those developments administered through the NEMA, MPRDA and the Development Facilitation Act (DFA) legislation. In the latter cases the feedback from the relevant heritage resources authority is required by the State and Provincial Departments managing these Acts before any authorisations are granted for a development. The last few years have seen a significant change towards the inclusion of heritage assessments as a major component of Environmental Impact Processes required by the NEMA and MPRDA. This change requires an evaluation of the Section of these Acts relevant to heritage.

The NHRA provides for the protection of South Africa's natural heritage, including wrecks or associated debris or artefacts that may be found or disturbed on the seabed. Section 13 states that the South African Heritage Resources Agency (SAHRA) is the statutory organisation responsible for the protection of South Africa's cultural heritage. SAHRA thus has jurisdiction over any shipwrecks that may occur within the territorial waters and the maritime cultural zone fall. According to Section 35 of the NHRA, any person who discovers archaeological objects or material (including wrecks) in the course of a development must immediately report the find to SAHRA. No person may, without a permit issued by SAHRA, destroy, damage, excavate, alter, deface or otherwise disturb any archaeological site.

Furthermore, Section 38 deals with matters of Heritage Resource Management. Section 38(8) states that *"(8) The provisions of this section do not apply to a development as described in subsection (1) if an evaluation of the impact of such development on heritage resources is required in terms of the Environment Conservation Act, 1989 (Act No. 73 of 1989), or the integrated environmental management guidelines issued by the Department of Environment Affairs and Tourism, or the Minerals Act, 1991 (Act No. 50 of 1991), or any other legislation:*

Provided that the consenting authority must ensure that the evaluation fulfils the requirements of the relevant heritage resources authority in terms of subsection (3), and any comments and recommendations of the relevant heritage resources authority with regard to such development have been taken into account prior to the granting of the consent."

In terms of the above, in terms of this section, the South African Heritage Resources Agency (SAHRA) would need to be notified regarding the proposed development and would act as a key commenting authority.

4.5 NATIONAL ENVIRONMENTAL MANAGEMENT: PROTECTED AREAS ACT

The National Environmental Management Protected Areas Act (Act No. 57 of 2003 – NEMPAA) is intended to *"provide for the protection and conservation of ecologically viable areas representative of South Africa's biological diversity and its natural landscapes and seascapes"* and creating a *"national system of protected areas in South Africa as part of a strategy to manage and conserve its biodiversity"*.

The NEMPAA defines various kinds of protected areas, namely: *"special nature reserves, national parks, nature reserves (including wilderness areas) and protected environments; world heritage sites; marine protected areas; specially protected forest areas, forest nature reserves and forest wilderness areas declared in terms of the National Forests Act, 1998 (Act 84 of 1998); and mountain catchment areas declared in terms of the Mountain Catchment Areas Act, 1970 (Act 63 of 1970)"*.

There are six offshore Marine Protected Areas (MPAs) in the general project area but none fall within the Application Area. The proposed 3D Application Area lies well offshore of these MPAs. Critical biodiversity areas (CBAs) within the Reconnaissance Permit and 3D Application Areas include both CBA1: natural and CBA2: natural areas.

4.6 ADDITIONAL SOUTH AFRICAN LEGISLATION

Additional legislation may be applicable to the proposed project. These are presented in Table 5 below.

Table 5: Applicable legislation and guidelines overview

Legislation / Guidelines	Description
Potentially Applicable Legislation	
Dumping at Sea Control Act (Act No. 73 of 1980)	This Act controls the dumping of substances at sea. The Act lists substances that are prohibited to be dumped at sea (Schedule 1) and substances that are restricted when dumping at sea (Schedule 2). The Director-General may on application grant a special permit authorising the dumping of substances listed in Schedule 1 or 2.
Environment Conservation Act (Act No. 73 of 1989)	The Environment Conservation Act (Act No. 73 of 1989 – ECA) was, prior to the promulgation of the NEMA, the backbone of environmental legislation in South Africa. To date the majority of the ECA has been repealed by various other Acts, however Section 25 of the Act and the Noise Regulations (GN R. 154 of 1992) promulgated under this section are still in effect. These Regulations serve to control noise and general prohibitions relating to noise impact and nuisance.
Hazardous Substances Act (Act No. 15 of 1973)	This Act provides for the control of substances which may cause injury or ill-health to or death of human. No person may, without a licence: (1) sell any Group I Hazardous Substance; (2) use, operate or apply any Group III Hazardous Substance (listed electronic products); and (3) install or keep any Group III Hazardous Substance.
Marine Living Resources Act (Act No. 18 of 1998)	This Act provides for the conservation of marine ecosystems, the long-term sustainable utilisation of marine living resources and the orderly access to exploitation, utilisation and protection of certain marine living resources.

FW28

Legislation / Guideline	Description
	The Small Scale Fishers Policy was gazetted in May 2019 under the Marine Living Resources Act.
Marine Traffic Act (Act No. 2 of 1981)	This Act regulates marine traffic in South Africa's territorial waters. It regulates the entry and dropping of anchor within 500 m safety zone of installations.
Marine Pollution (Control and Civil Liability) Act (Act No. 6 of 1981)	The purpose of this Act is to provide protection of the marine environment from pollution by oil and other harmful substances, by giving power to South African Maritime Safety Authority (SAMSA) to take steps to prevent harmful substances being discharged from vessels. The applicant would have to disclose to SAMSA before the commencement of proposed activities the amounts and types of chemicals that would be used and disposed of during operations. No disposal of waste at sea is proposed.
Marine Pollution (Prevention of Pollution from Ships) Act (Act No. 2 of 1986)	This Act regulates pollution from ships, tankers and offshore installations, and for that purpose gives effect to MARPOL 73/78. In terms of the Act, it is an offence to discharge any oil from a ship, tanker or offshore installation within 12 miles (19 km) off the South African coast. The discharge of oily water or oil and any other substance which contains more than a hundred parts per million of oil is prohibited between 19 – 80 km offshore. No dumping at sea is proposed as part of this application.
Marine Pollution (Intervention) Act (Act No. 65 of 1987)	This Act gives effect to the international convention relating to the intervention of the High Seas in cases of oil pollution casualties, and to the Protocol relating to intervention of the High Seas in cases of Marine Pollution by substances other than Oil in South African Waters.
Maritime Safety Authority Act (Act No. 5 of 1998)	This Act provides for the establishment and functions of SAMSA. The objectives of the Act are to, inter alia: (1) ensure safety of life and property at sea; (2) prevent and combat pollution of the marine environment by ship; and (3) promote South Africa's maritime interests.
Maritime Safety Authority Levies Act (Act No. 6 of 1998)	This Act provides for the imposition of levies by SAMSA. SAMSA is permitted to raise and collect a levy on all vessels calling at South African ports and operating in South African waters.
Maritime Zones Act (Act No. 15 of 1994)	The Act defines the maritime zones, including territorial waters, contiguous zone, exclusive economic zone and continental shelf. Section 9(1) states that any law in force in South Africa shall also apply on and in respect of an installation.
National Environmental Management: Biodiversity Act (Act No. 10 of 2004)	This Act regulates the carrying out of restricted activities that may harm listed threatened or protected species or activities that encourage the spread of alien or invasive species subject to a permit.
Maritime Safety Authority Levies Act (Act No. 6 of 1998)	This Act provides for the imposition of levies by SAMSA. SAMSA is permitted to raise and collect a levy on all vessels calling at South African ports and operating in South African waters.
National Environmental Management: Integrated Coastal Management Act (Act No. 24 of 2008)	This Act supports the authorisation requirements of NEMA but specifies additional criteria for regulating activities or developments (Section 63) and provides for pollution control within the coastal zone (Sections 69 to 73), where the coastal zone includes the Exclusive Economic Zone defined in the Maritime Zone Act.

Legislation / Guidelines	Description
National Ports Act (Act No. 12 of 2005)	This Act regulates and controls navigation within port limits and the approaches to ports, cargo handling, and the pollution and the protection of the environment within the port limits. The Act specifies a requirement for an agreement with or a licence from the National Ports Authority to operate a port facility or service.
Sea-Shore Act (Act No. 21 of 1935)	This Act declares the State President the owner of the seashore and the sea within the territorial waters of South Africa and provides for the grant of rights in respect of the seashore and the sea and for the alienation of portions of the seashore and the sea.
Applicable Guidelines	
Integrated Environmental Management Information Guidelines Series	The various guidelines will be considered throughout this environmental Scoping and Impact Assessment process. This series of guidelines was published by the Department of Environmental Affairs (DEA – now DFFE) and refers to various environmental aspects. Applicable guidelines in the series for the project include: Guideline 5: Companion to NEMA EIA Regulations (October 2012); Guideline 7: Public participation (October 2012); and Guideline 9: Need and desirability (October 2014). Additional guidelines published in terms of the NEMA EIA Regulations, 2014 (as amended), in particular: Guideline 3: General Guide to Environmental Impact Assessment Regulations, 2006; Guideline 4: Public Participation in support of the EIA Regulations, 2006; and Guideline 5: Assessment of alternatives and impacts in support of the EIA Regulations, 2006.

4.7 NATIONAL POLICY AND PLANNING CONTEXT

Various other national policy and planning may be of specific relevance to the needs and desirability of the project with respect to overarching energy and climate change policy and planning in South Africa. These are described below:

4.7.1 INTEGRATED RESOURCE PLAN 2019

The Minister of Mineral Resources and Energy (Minister) published the current Integrated Resource Plan (IRP 2019) as GN 1360 of 18 October 2019 in Government Gazette No. 4278. The Determination provides for various energy sources to be procured from Independent Power Producers (IPPs) through one or more IPP Procurement Programmes as contemplated in the Electricity Regulations on New Generation Capacity, 2011. The plan aimed to balance a number of objectives, namely to ensure security of supply, to minimize cost of electricity, to minimize negative environmental impact (emissions) and to minimize water usage. The IRP 2019 makes provision for gas from year 2024.

4.7.2 NATIONAL DEVELOPMENT PLAN 2030

The NDP aims to eliminate poverty and reduce inequality by 2030. According to the plan, South Africa can realise these goals by drawing on the energies of its people, growing an inclusive economy, building capabilities, enhancing the capacity of the state, and promoting leadership and partnerships throughout society. One of the

568

key priorities is "faster and more inclusive economic growth". To transform the economy and create sustainable expansion for job creation, an average economic growth exceeding 5% per annum is required. The NDP makes numerous mentions of the need to act responsibly to mitigate the effects of climate change. Diversification of the energy mix away from fossil fuels will be key as energy generation makes up 48 percent of South Africa's GHG emissions. The NDP indicates that "the country will explore the use of natural gas as a less carbon intensive transitional fuel".

4.7.3 WHITE PAPER ON THE ENERGY POLICY OF THE REPUBLIC OF SOUTH AFRICA (1998)

- The White Paper on the Energy Policy (1998) is the overarching policy document which guides future policy and planning in the energy sector. The policy objectives include the stimulation of economic development, management of energy related environmental and health impacts and diversification of the country's energy supply to ensure energy security. The paper states that the government will, inter alia, "promote the development of South Africa's oil and gas resources..." and "ensure private sector investment and expertise in the exploitation and development of the country's oil and gas resources". The successful exploitation of these natural resources would contribute to the growth of the economy and relieve pressure on the balance of payments.

4.7.4 NATIONAL GAS INFRASTRUCTURE PLAN (2005)

- The gas infrastructure plan is intended to be a strategy for the development of the natural gas industry in South Africa. Government wishes to promote the gas industry based on its energy policy objectives as set out in the White Paper on Energy (1998). These include:

  - Increasing access to affordable energy services;
  - Improving energy governance;
  - Stimulating economic activity;
  - Managing energy-related environmental impacts;
  - Securing security of supply through diversity of supply;
  - Competition within and between energy carriers; and
  - Promoting New Partnership for African Development (NEPAD) cross-border type projects.

4.7.5 PARIS AGREEMENT – UNITED NATIONS FRAMEWORK CONVENTION ON CLIMATE CHANGE

The Paris Agreement is a legally binding international treaty on climate change. It was adopted by 196 Parties at COP 21 in Paris, on 12 December 2015 and entered into force on 4 November 2016. The Paris Agreement aims to limit the global temperature increase to below 2 °C. Each individual country is responsible for determining their contribution (referred to as the "nationally determined contribution") in reaching this goal. As a signatory to the Agreement, South Africa will be required to adopt the agreement within its own legal systems, through ratification, acceptance, approval or accession. "As a signatory to the Paris Agreement, South Africa is required to investigate alternatives to existing industries which have high carbon emissions. A shift away from coal-based energy production within the energy sector and increased reliance on alternative energy sources is therefore anticipated."

4.7.6 NATIONAL CLIMATE CHANGE RESPONSE WHITE PAPER

The majority of South Africa's energy emissions arise from electricity generation. The Paper sets out South Africa's overall response strategy though strategic priorities, leading to a series of adaption, mitigation, response measures and priority flagship programmes. Policy decisions on new infrastructure investments must consider climate change impacts to avoid the lock-in of emissions intensive technologies into the future. In the medium-

term, the Paper indicates that a mitigation option with the biggest potential includes a shift to lower-carbon electricity generation options.

4.8 INTERNATIONAL LEGISLATION

4.8.1 UNITED NATIONS CONVENTION ON THE LAW OF THE SEA

The United Nations Convention on the Law of the Sea 1982 sets out the roles and responsibilities of the signatory nations in the use of the oceans. The convention establishes guidelines for governments, businesses, and other organisations for the management of marine natural resources. The fundamental principle established in the Convention is that States should cooperate to ensure conservation and promote the objective of the optimum utilization of fisheries resources both within and beyond the exclusive economic zone.

The Agreement attempts to achieve this objective by providing a framework for cooperation in the conservation and management of those resources. It promotes the effective management and conservation of international marine resources by establishing, among other things, detailed minimum international standards for the conservation and management of straddling fish stocks and highly migratory fish stocks; ensuring that measures taken for the conservation and management of those stocks in areas under national jurisdiction and in the adjacent international waters are compatible and coherent; ensuring that there are effective mechanisms for compliance and enforcement of those measures in international waters; and recognizing the special requirements of developing States in relation to conservation and management as well as the development and participation in fisheries of straddling and highly migratory fish stocks.

4.8.2 INTERNATIONAL REGULATIONS FOR PREVENTING COLLISIONS AT SEA

Under the convention on the International Regulations for Preventing Collisions at Sea, a seismic survey vessel that is engaged in surveying is defined as a "vessel restricted in its ability to manoeuvre" and power-driven and sailing vessels are therefore required to give way to it. Vessels engaged in fishing shall, in so far as possible, keep out of the way of the seismic survey operation. Furthermore, under the Marine Traffic Act, 1981 (No. 2 of 1981), a seismic survey vessel and its array of sound sources and hydrophones fall under the definition of an "offshore installation" and as such it is protected by a 500 m horizontal safety zone. It is an offence for an unauthorised vessel to enter the safety zone. In addition to a statutory 500 m safety zone, seismic contractors generally request a safe operational limit (that is greater than the 500 m safety zone) that they would like other vessels to stay beyond. Support vehicles are usually commissioned as 'chase' boats to ensure that other vessels adhere to the safe operational limits.

4.8.3 INTERNATIONAL MARINE CONVENTIONS

The following international marine conventions may be applicable to the proposed survey activities:

- International Convention for the Prevention of Pollution from Ships, 1973/1978 (MARPOL);
- Amendment of the International Convention for the Prevention of Pollution from Ships, 1973/1978 (MARPOL) (Bulletin 567 – 2/08);
- International Convention on Oil Pollution Preparedness, Response and Co-operation, 1990 (OPRC Convention);
- Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter, 1972 (the London Convention) and the 1996 Protocol (the Protocol);
- International Convention relating to Intervention on the High Seas in case of Oil Pollution Casualties (1969) and Protocol on the Intervention on the High Seas in Cases of Marine Pollution by substances other than oil (1973);
- Basel Convention on the Control of Trans-boundary Movements of Hazardous Wastes and their Disposal (1989);

5.02

- Convention on Biological Diversity (1992); and
- Benguela Current Convention (2013).

5 NEED AND DESIRABILITY OF THE PROPOSED ACTIVITY

The area proposed for the seismic survey is a large under-explored area with potential for both oil and gas. Based on the initial information review undertaken, TGS has designed a 3D seismic survey to specifically target the area highlighted in Figure 1.

5.1 GUIDELINE ON NEED AND DESIRABILITY IN TERMS OF THE EIA REGULATIONS

The needs and desirability analysis component of the "Guideline on need and desirability in terms of the EIA Regulations (Notice 819 of 2014)" includes, but is not limited to, describing the linkages and dependencies between human well-being, livelihoods and ecosystem services applicable to the area in question, and how the proposed development's ecological impacts will result in socio-economic impacts (e.g. on livelihoods, opportunity costs, etc.). Table 6 present the needs and desirability analysis undertaken for the project.

293

Table 6: Needs and desirability analysis for the proposed co-disposal facility.

Ref No.	Question	Answer
1	Securing ecological sustainable development and use of natural resources	
1.1	How were the ecological integrity considerations taken into account in terms of: Threatened Ecosystems, Sensitive and vulnerable ecosystems, Critical Biodiversity Areas, Ecological Support Systems, Conservation Targets, Ecological drivers of the ecosystem, Environmental Management Framework, Spatial Development Framework (SDF) and global and international responsibilities.	A number of specialist studies have informed this application and include: • Marine Ecological Impact Assessment; • Fisheries Impact Assessment; • Heritage Impact Assessment; • Social Impact Assessment; and • Acoustic (Noise) Technical Report The conclusions of these studies are included in this report.
1.2	How will this project disturb or enhance ecosystems and / or result in the loss or protection of biological diversity? What measures were explored to avoid these negative impacts, and where these negative impacts could not be avoided altogether, what measures were explored to minimise and remedy the impacts? What measures were explored to enhance positive impacts?	Refer to baseline marine ecological statement in Section 8, and the impact assessment in Section 9 of this report.
1.3	How will this development pollute and / or degrade the biophysical environment? What measures were explored to either avoid these impacts, and where impacts could not be avoided altogether, what measures were explored to minimise and remedy the impacts? What measures were explored to enhance positive impacts?	
1.4	What waste will be generated by this development? What measures were explored to avoid waste, and where waste could not be avoided altogether, what measures were explored to minimise, reuse and / or recycle the waste? What measures have been explored to safely treat and/or dispose of unavoidable waste?	Waste will be generated during the operational phase. The types of waste generated include sewage waste, biodegradable galley wastes, and non-biodegradable solid waste. Waste has been identified as an impact and assessed in Section 9 below. However, it is anticipated that the following measures can be utilised to reduce the impact of the waste on the receiving environment: • Visual inspection that waste does not leave the vessel; • Waste must be securely stored.

Ref No.	Question	Answer
		• All hazardous waste such as oil must be stored seperately and disposed of at a registered facility. • Proof of disposal must be kept by the Applicant.
1.5	How will this project disturb or enhance landscapes and / or sites that constitute the nation's cultural heritage? What measures were explored to firstly avoid these impacts, and where impacts could not be avoided altogether, what measures were explored to minimise and remedy the impacts? What measures were explored to enhance positive impacts?	There are six offshore Marine Protected Areas (MPAs) in the general project area, but none fall within the Application Area. The proposed 3D Application Area lies well offshore of these MPAs. CBAs within the Application Area include both CBA1: natural and CBA2: natural areas. It is recommended that post project, the effects on the identified communities and their intangible cultural heritage as well as of related economic damage and losses, and human development impacts be assessed to verify the findings of the predictive impact assessment. Based on the outcomes resource provision and support for communities to develop and undertake safeguarding measures or plans to enhance the mitigation capacity of their intangible cultural heritage by fostering dialogue, mutual understanding and reconciliation between and within communities is recommended. It is anticipated that this can be achieved through the implementation of the mitigation measures in the Social Impact Assessment.
1.6	How will this project use and / or impact on non-renewable natural resources? What measures were explored to ensure responsible and equitable use of the resources? How have the consequences of the depletion of the non-renewable natural resources been considered? What measures were explored to firstly avoid these impacts, and where impacts could not be avoided altogether, what measures were explored to minimise and remedy the impacts? What measures were explored to enhance positive impacts?	Refer to the impact assessment in Section 9 of this report. As a result of the fact that this project entails a 3D seismic survey only it is anticipated that this project will not lead to a significant impact or depletion of non-renewable resources.
1.7	How will this project use and / or impact on renewable natural resources and the ecosystem of which they are part? Will the use of the resources and / or impacts on the ecosystem jeopardise the integrity of the resource and / or system taking into account carrying capacity restrictions, limits of acceptable change, and thresholds? What measures were explored to firstly avoid the use of resources, or if avoidance is not possible, to minimise the use of resources? What measures were taken to ensure responsible and equitable use of the resources? What measures were explored to enhance positive impacts?	Refer to the impact assessment in Section 9 of this report. It is anticipated that the project will have a low impact on the localised marine ecology and fisheries.

Ref No.	Question	Answer
1.7.1	Does the proposed project exacerbate the increased dependency on increased use of resources to maintain economic growth or does it reduce resource dependency (i.e. de-materialised growth)?	The proposed project aims to identify oil and gas resources to be used in the energy production and/ or processing or manufacturing of materials.
1.7.2	Does the proposed use of natural resources constitute the best use thereof? Is the use justifiable when considering intra- and intergenerational equity, and are there more important priorities for which the resources should be used?	The proposed project aims to identify oil and gas resources and will not, at this stage, involve the use of the natural resources identified as part of the proposed survey project.
1.7.3	Do the proposed location, type and scale of development promote a reduced dependency on resources?	The proposed project aims to identify oil and gas resources and will not, at this stage, involve the use of the natural resources identified as part of the proposed survey project.
1.8	How were a risk-averse and cautious approach applied in terms of ecological impacts:	
1.8.1	What are the limits of current knowledge (note: the gaps, uncertainties and assumptions must be clearly stated)?	The limitations and/or gaps in knowledge are presented in Sections 11.4.5 and 12.
1.8.2	What is the level of risk associated with the limits of current knowledge?	The level of risk is considered low at this stage.
1.8.3	Based on the limits of knowledge and the level of risk, how and to what extent was a risk-averse and cautious approach applied to the development?	As a result of the fact that this project entails only survey activities, it is anticipated that this project will not lead to a significant impact on the receiving environment. Refer to the impact assessment in Section 9 of this report. There is a deficiency in terms of local research in SA waters, but that international research is, in the view of the specialists, adequate for predicting risk- result and risk has been identified as low. Recommendations have been included to take the opportunity presented by this project to enhance/ encourage site-specific local research.
1.9	How will the ecological impacts resulting from this development impact on people's environmental right in terms following?	
1.9.1	Negative impacts: e.g. access to resources, opportunity costs, loss of amenity (e.g. open space), air and water quality impacts, nuisance (noise, odour, etc.), health impacts, visual impacts, etc. What measures were taken to firstly avoid negative impacts, but if avoidance is not possible, to minimise, manage and remedy negative impacts?	The proposed activities are anticipated to have low negative ecological impacts. Refer to the impact assessment in Section 9 in this report.
1.9.2	Positive impacts: e.g. improved access to resources, improved amenity, improved air or water quality, etc. What measures were taken to enhance positive impacts?	

Ref No.	Question	Answer
1.10	Describe the linkages and dependencies between human wellbeing, livelihoods and ecosystem services applicable to the area in question and how the development's ecological impacts will result in socio-economic impacts (e.g. on livelihoods, loss of heritage site, opportunity costs, etc.)?	A medium to low impact on third party wellbeing, livelihoods and ecosystem services is foreseen. Refer to the impact assessment in Section 9 of this report.
1.11	Based on all of the above, how will this development positively or negatively impact on ecological integrity objectives / targets / considerations of the area?	The proposed survey activities are anticipated to have generally low negative marine ecological impacts. Refer to the impact assessment in Section 9 in this report.
1.12	Considering the need to secure ecological integrity and a healthy biophysical environment, describe how the alternatives identified (in terms of all the different elements of the development and all the different impacts being proposed), resulted in the selection of the "best practicable environmental option" in terms of ecological considerations?	Refer to Section 8, details of the alternatives considered.
1.13	Describe the positive and negative cumulative ecological / biophysical impacts bearing in mind the size, scale, scope and nature of the project in relation to its location and existing and other planned developments in the area?	Refer to Section 9 of this report.
2	Promoting justifiable economic and social development	
2.1	What is the socio-economic context of the area, based on, amongst other considerations, the following:	
2.1.1	The IDP (and its sector plans' vision, objectives, strategies, indicators and targets) and any other strategic plans, frameworks or policies applicable to the area	The offshore area of activity, as well as the Exclusive Economic Zone (EEZ) as a whole, do not fall within the borders of any municipality or province of South Africa. Thus, the related planning documentation, especially at the District and Local Municipality level, typically don't directly address offshore areas and activities in a significant level of detail. The Application Area is located adjacent to the Namakwa District Municipality and the West Coast District Municipality. Refer to Section 8.7 of this report for a breakdown of the demographics and social environment in these areas. The Namakwa IDP (2022 – 2027) aligns with the Nine Point Plan identified by the National Government and identifies the Growing the Oceans Economy and Tourism – Small Harbour Development & Coastal and Marine Tourism. The IDP does not specifically mention offshore activities or exploration. The impact of the actual seismic survey activities on the local economy is anticipated to be limited. Spatial Development Goal 4 of the West Coast District Municipality IDP (2022 – 2027) states that the district should promote sustainable utilisation of the District's natural resource base

2297

Ref No.	Question	Answer
		to extract economic development opportunities. The impact of the seismic survey activities on the local economy is anticipated to be limited however it will potentially allow significant economic growth in the future. More detail is provided in the Social Assessment report included in Appendix 3.
2.1.2	Spatial priorities and desired spatial patterns (e.g. need for integration of segregated communities, need to upgrade informal settlements, need for densification, etc.).	Survey activities typically require highly skilled employment. However, where feasible, it is anticipated that the use of local labour could be utilised, but it is anticipated that this will be extremely limited, if at all.
2.1.3	Spatial characteristics (e.g. existing land uses, planned land uses, cultural landscapes, etc.); and	Refer to the baseline environment in Section 6 of this report.
2.1.4	Municipal Economic Development Strategy ("LED Strategy").	Considering the location of the activities, it is not anticipated to significantly promote or facilitate spatial transformation and sustainable urban development.
2.2	Considering the socio-economic context, what will the socio-economic impacts be of the development (and its separate elements/aspects), and specifically also on the socio-economic objectives of the area?	Refer to the impact assessment in Section 9 in this report."
2.2.1	Will the development complement the local socio-economic initiatives (such as local economic development (LED) initiatives), or skills development programs?	Survey activities typically require highly skilled employment. However, where feasible, it is anticipated that the use of local labour could be utilised, but it is anticipated that this will be extremely limited, if at all. It is recommended that TGS consult with communities on potential ways in which to make a positive contribution to the communities.
2.3	How will this development address the specific physical, psychological, developmental, cultural and social needs and interests of the relevant communities?	Refer to the public participation process and feedback contained in Appendix 2.
2.4	Will the development result in equitable (intra- and inter-generational) impact distribution, in the short- and long-term? Will the impact be socially and economically sustainable in the short- and long-terms?	Refer to the impact assessment and mitigation measures in Section 9 of this report.
2.5	In terms of location, describe how the placement of the proposed development will:	

Ref No.	Question	Answer
2.5.1	Result in the creation of residential and employment opportunities in close proximity to or integrated with each other.	Survey activities typically require highly skilled employment. However, where feasible, it is anticipated that the use of local labour could be utilised, but it is anticipated that this will be extremely limited, if at all.
2.5.2	Reduce the need for transport of people and goods.	The activities are not anticipated to have an impact on the transportation of goods and people.
2.5.3	Result in access to public transport or enable non-motorised and pedestrian transport (e.g. will the development result in densification and the achievement of thresholds in terms of public transport).	The activities are not anticipated to have an impact on the public transport.
2.5.4	Compliment other uses in the area.	The offshore area has been subjected to a number of previous exploration activities as well as previous 2D and 3D surveys.
2.5.5	Be in line with the planning for the area.	Refer to item 2.1.1 of this table (above).
2.5.6	For urban infill development, make use of underutilised land available with the urban edge.	Not applicable. The proposed project is not located in an urban area.
2.5.7	Optimise the use of existing resources and infrastructure.	Refer to Section 3 of this report.
2.5.8	Opportunity costs in terms of bulk infrastructure expansions in non-priority areas (e.g. not aligned with the bulk infrastructure planning for the settlement that reflects the spatial reconstruction priorities of the settlement).	
2.5.9	Discourage "urban sprawl" and contribute to compaction / densification.	Not applicable. The proposed project is not located in an urban area.
2.5.10	Contribute to the correction of the historically distorted spatial patterns of settlements and to the optimum use of existing infrastructure in excess of current needs.	Refer to items 2.5.7 – 2.5.9 of this table (above).
2.5.11	Encourage environmentally sustainable land development practices and processes	As a result of the fact that this project does not directly entail the exploration for oil and gas, it is anticipated that this project will not lead to a highly significant impact on the receiving environment.

Ref No.	Question	Answer
2.5.12	Take into account special locational factors that might favour the specific location (e.g. the location of a strategic mineral resource, access to the port, access to rail, etc.),	The proposed project aims to identify potentially strategic oil and gas resources.
2.5.13	The investment in the settlement or area in question will generate the highest socio-economic returns (i.e. an area with high economic potential).	The proposed project aims to identify oil and gas resources. Given the location offshore, it is not anticipated that the survey activities will contribute to the significantly to settlements or areas in terms of socio-economic returns.
2.5.14	Impact on the sense of history, sense of place and heritage of the area and the socio-cultural and cultural-historic characteristics and sensitivities of the area, and	Refer to impact assessment in Section 9 of this report.
2.5.15	In terms of the nature, scale and location of the development promote or act as a catalyst to create a more integrated settlement?	Given the location offshore, it is not anticipated that the activities will contribute to the significantly to settlements or areas in terms of socio-economic returns.
2.6	How was a risk-averse and cautious approach applied in terms of socio-economic impacts:	
2.6.1	What are the limits of current knowledge (note: the gaps, uncertainties and assumptions must be clearly stated)?	Refer to Sections 11.4.5 and 12 of this report.
2.6.2	What is the level of risk (note: related to inequality, social fabric, livelihoods, vulnerable communities, critical resources, economic vulnerability and sustainability) associated with the limits of current knowledge?	The level of risk is low as the project is not expected to have far reaching negative impacts on socio-economic conditions.
2.6.3	Based on the limits of knowledge and the level of risk, how and to what extent was a risk-averse and cautious approach applied to the development?	The level of risk is low as the project is not expected to have far reaching highly negative impacts on socio-economic conditions. The survey area is located 120 km offshore, outside of the fisheries ringfence area. Since the survey activities will not include any drilling at this stage, a risk averse and cautious approach has been implemented to limit the impact on the surrounding environment.
2.7	How will the socio-economic impacts resulting from this development impact on people's environmental right in terms following:	
2.7.1	Negative impacts: e.g. health (e.g. HIV-Aids), safety, social ills, etc. What measures were taken to firstly avoid negative impacts, but if avoidance is not possible, to minimise, manage and remedy negative impacts?	Refer to the impact assessment in Section 9 of this report.

Ref No.	Question	Answer
2.7.2	Positive impacts. What measures were taken to enhance positive impacts?	Refer to the impact assessment in Section 9 of this report.
2.8	Considering the linkages and dependencies between human wellbeing, livelihoods and ecosystem services, describe the linkages and dependencies applicable to the area in question and how the development's socioeconomic impacts will result in ecological impacts (e.g. over utilisation of natural resources, etc.)?	Refer to the impact assessment in Section 9 of this report.
2.9	What measures were taken to pursue the selection of the "best practicable environmental option" in terms of socio-economic considerations?	Refer to the impact assessment in Section 9 of this report.
2.10	What measures were taken to pursue environmental justice so that adverse environmental impacts shall not be disributed in such a manner as to unfairly discriminate against any person, particularly vulnerable and disadvantaged persons (who are the beneficiaries and is the development located appropriately)? Considering the need for social equity and justice, do the alternatives identified, allow the "best practicable environmental option" to be selected, or is there a need for other alternatives to be considered?	Refer to the impact assessment in Section 9 of this report. The survey activities typically require highly skilled employment. However, where feasible, it is anticipated that the use of local labour could be utilised, but it is anticipated that this will be extremely limited, if at all.
2.11	What measures were taken to pursue equitable access to environmental resources, benefits and services to meet basic human needs and ensure human wellbeing, and what special measures were taken to ensure access thereto by categories of persons disadvantaged by unfair discrimination?	By conducting a Basic Assessment Process, the applicant ensures that equitable access has been considered. Refer to the impact assessment in Section 9 of this report.
2.12	What measures were taken to ensure that the responsibility for the environmental health and safety consequences of the development has been addressed throughout the development's life cycle?	Refer to the impact assessment in Section 9 of this report. The EMPr will specify timeframes within which mitigation measures must be implemented.
2.13	What measures were taken to:	
2.13.1	Ensure the participation of all interested and affected parties.	Refer to Section 7 of this report, describing the public participation process undertaken for the proposed project.
2.13.2	Provide all people with an opportunity to develop the understanding, skills and capacity necessary for achieving equitable and effective participation.	Refer to Section 7 of this report, describing the public participation process undertaken for the proposed project. The BID, advertisement, notification letter and site notice have been

Ref No.	Question	Answer
2.13.3	Ensure participation by vulnerable and disadvantaged persons,	made available in English, isiXhosa and Afrikaans to assist in understanding of the project. In addition, the BA report executive summary will be made available in all three of these languages. Further public consultation will be held during the review period of the BA report for the project.
2.13.4	Promote community wellbeing and empowerment through environmental education, the raising of environmental awareness, the sharing of knowledge and experience and other appropriate means;	
2.13.5	Ensure openness and transparency, and access to information in terms of the process,	
2.13.6	Ensure that the interests, needs and values of all interested and affected parties were taken into account, and that adequate recognition were given to all forms of knowledge, including traditional and ordinary knowledge.	
2.13.7	Ensure that the vital role of women and youth in environmental management and development were recognised and their full participation therein will be promoted?	
2.14	Considering the interests, needs and values of all the interested and affected parties, describe how the development will allow for opportunities for all the segments of the community (e.g. a mixture of low-, middle-, and high-income housing opportunities) that is consistent with the priority needs of the local area (or that is proportional to the needs of an area)?	Refer to Section 7 of this report, describing the public participation process undertaken for the proposed project.
2.15	What measures have been taken to ensure that current and / or future workers will be informed of work that potentially might be harmful to human health or the environment or of dangers associated with the work, and what measures have been taken to ensure that the right of workers to refuse such work will be respected and protected?	Potential future workers will have to be educated on a regular basis as to the environmental and safety risks that may occur within their work environment. Furthermore, adequate measures will have to be taken to ensure that the appropriate personal protective equipment is issued to workers based on the conditions that they work in and the requirements of their job.
2.16	Describe how the development will impact on job creation in terms of, amongst other aspects:	
2.16.1	The number of temporary versus permanent jobs that will be created.	Reconnaissance and exploration activities typically require highly skilled employment. However, where feasible, it is anticipated that the use of local labour could be utilised, but it is anticipated that this will be extremely limited, if at all. The majority of the work will be done remotely through the acquisition and processing of existing information. However,
2.16.2	Whether the labour available in the area will be able to take up the job opportunities (i.e. do the required skills match the skills available in the area).	

Ref No.	Question	Answer
2.16.3	The distance from where labourers will have to travel.	should local labour be required during the possible 3D seismic survey, then travel will be from suitable ports.
2.16.4	The location of jobs opportunities versus the location of impacts.	
2.16.5	The opportunity costs in terms of job creation.	
2.17	What measures were taken to ensure:	
2.17.1	That there were intergovernmental coordination and harmonization of policies, legislation and actions relating to the environment.	The EIA Process requires governmental departments to communicate regarding any application. In addition, all relevant departments are notified at various phases of the project by the EAP.
2.17.2	That actual or potential conflicts of interest between organs of state were resolved through conflict resolution procedures.	
2.18	What measures were taken to ensure that the environment will be held in public trust for the people, that the beneficial use of environmental resources will serve the public interest, and that the environment will be protected as the people's common heritage?	Refer to Section 7 of this report, describing the public participation process implemented for the application, as well as Section 8, the impact on any national estate.
2.19	Are the mitigation measures proposed realistic and what long-term environmental legacy and managed burden will be left?	Refer to the impact assessment and mitigation measures in Section 9 of the report.
2.20	What measures were taken to ensure that the costs of remedying pollution, environmental degradation and consequent adverse health effects and of preventing, controlling or minimising further pollution, environmental damage or adverse health effects will be paid for by those responsible for harming the environment?	The proposed survey activities are not anticipated to produce significant pollution, environmental damage or adverse health effects in the long term.
2.21	Considering the need to secure ecological integrity and a healthy bio-physical environment, describe how the alternatives identified (in terms of all the different elements of the development and all the different impacts being proposed), resulted in the selection of the best practicable environmental option in terms of socio-economic considerations?	Refer to Section 6, description of the process followed to reach the proposed preferred site.

303

Ref No.	Question	Answer
2.22	Describe the positive and negative cumulative socio-economic impacts bearing in mind the size, scale, scope and nature of the project in relation to its location and other planned developments in the area?	Refer to the impact assessment and mitigation measures in Section 9 of the BA Report.

5.2 NEED FOR SEISMIC DATA

In addition to the information presented in Table 6 above, a discussion of the needs and desirability of the project would not be complete without understanding the need for acquisition of the seismic data and possible oil and gas exploration and production that could potentially take place in the future as a result of the survey. It cannot be said with absolute certainty that exploration drilling, let alone production activities, will be undertaken in the future. As such, it is not currently possible to accurately assess the risks associated with these activities, given that the specific details of these potential future activities are not known. While it is acknowledged that the risks mentioned would need assessment, such assessment falls outside of the scope of the current application and would need to be assessed in detail during subsequent Scoping and EIA processes, should exploration drilling or production be proposed. The environmental consequences applicable to the planned survey activities have been identified and assessed in this BA Report.

The fastest growing sector for the use of natural gas is for the generation of electric power. Natural gas power plants usually generate electricity in gas turbines, directly using the hot exhaust gases from the combustion of the gas (USCUSA, 2015). Of the three fossil fuels used for electric power generation (coal, oil and natural gas), natural gas emits the least carbon dioxide per unit of energy produced. Natural gas emits 30% and 45% less carbon dioxide than burning oil and coal, respectively. Burning natural gas also releases lower amounts of nitrogen oxides, sulphur dioxide, particulates and mercury when compared to coal and oil.

The increased use of natural gas can, in the short term, serve as a transition fuel on the path to the carbon-neutral goal of the Paris Agreement. In addition to gas as a key transitional fuel reducing reliance on coal, the benefits of oil and gas could include significant amount of job creation, especially if local beneficiation takes place. An increase in domestic natural gas reserves would enable South Africa to take steps to secure the countries' energy supply (through diversification), assist in reducing the emissions of greenhouse gases (by reducing the country's reliance on coal for electricity generation) and reduce the need for the importation of gas. As such, exploration for additional domestic hydrocarbon reserves is considered important and supported by national policy, and any discoveries would be well received by the local market and are consistent with the objectives stated in the 2019 IRP. Natural gas emits 30% and 45% less carbon dioxide than burning oil and coal, respectively, and 65% less carbon dioxide than coal when the increased efficiency of Combined Cycle Gas Turbines versus coal fired power stations is considered. Eskom produces over 200MtCO2/yr, over 40% of South Africa's total. South Africa also has SASOL's Secunda coal to liquids plant, the biggest single source of CO_2 in the world at 57MtCO2/yr (~12.5% of South Africa's total) to produce 160k barrels of products per day. Supplying these products from conventional oil production and refining would generate approximately 10% of those emissions, 5 to 6MtCO2/yr.

According to the 2019 IRP the availability of gas in the short to medium term is a risk as South Africa does not currently have gas resources. There is also a supply and foreign exchange risk associated with likely increase in gas volumes depending on the energy mix adopted post 2030 when a large number of coal fired power stations are decommissioned. South Africa's economic growth is dependent on the availability of energy, ensuring a sustainable and reliable supply of electricity with sufficient capacity is a key aspect to growing the economy of South Africa in the future. The electricity shortages experienced in South Africa over the past decade are a contributing factor to the significant slowdown in economic growth rate. To enable economic growth within the target rate of between 5% and 8% to be achieved, it will be necessary for Government to continue increasing electricity generating capacity in the country. The use of natural gas for electricity generation is identified in national policy, together with renewable energy technologies, as an alternative in diversifying the domestic energy supply away from its current reliance on coal. Gas is identified in the draft Integrated Resources Plan as significant contributor to South Africa's energy mix in the period up to 2030. Availability of gas also provides an opportunity to convert to Combined Cycle Gas Turbine and run open-cycle gas turbine plants at Ankerlig (Saldanha Bay), Gourikwa (Mossel Bay), Avon (Outside Durban) and Dedisa (Coega IDZ) on gas (IRP 2019).

From a climate change perspective, it is not currently possible to accurately assess the risks associated with oil and gas activities, given that the specific details of these potential future activities are not known and therefore climate change impacts would need to be assessed in detail during any subsequent Scoping and EIA processes for any potential subsequent oil and gas production projects.

The feasibility of using natural gas for domestic power generation is considered to be dependent on the extent of available domestic reserves of natural gas, as well as the financial cost of importing natural gas should those reserves be insufficient. The acquisition of seismic survey data is therefore considered important with respect

to understanding the potential for future oil and gas production as part of the energy mix of the country going forward and the need and desirability of the project is therefore supported from an energy security perspective.

In addition to the above, seismic surveying is not only used for petroleum and natural gas exploration and development, it can in certain instances also be used for development of offshore wind, geothermal energy, and low-carbon solutions such as carbon capture and storage and also more generally for providing more insight and understanding into the regional geology of the area for scientific purposes.

This project can also provide an opportunity to conduct independent research on how fish species on the West Coast such as snoek respond to seismic surveying. Bearing in mind that the location of this particular survey is far offshore and impacts on the biophysical environment are expected to be relatively low this project is seen as a good opportunity to obtain local data and conduct local research which could be useful for similar projects and applications that may take place in the future.

8428

6 PROJECT ALTERNATIVES

This section provides a description of the alternatives considered as part of this BA process.

6.1 LOCATION ALTERNATIVES

The application area has been selected by TGS due to the high likelihood of containing significant hydrocarbon reserves. The application area is considered as the optimal area for such a survey due to its location well offshore and well outside of the fisheries ring-fence area. As such no location alternatives are considered feasible for the project.

6.2 LAYOUT ALTERNATIVES

Most of the ecosystem types in the Reconnaissance Permit Area are either poorly protected or not protected. CBAs within the Application Areas include both CBA1: natural and CBA2: natural areas (see Figure 91). CBA 1 indicates irreplaceable or near-irreplaceable sites that are required to meet biodiversity targets with limited, if any, option to meet targets elsewhere, whereas CBA 2 are "best design sites" and there are often alternative areas where feature targets can be met; however, these will be of higher cost to other sectors and / or will be larger areas. Activities within these management zones are classified into those that are "compatible", those that are "not compatible", and those that have "restricted compatibility". Non-invasive (e.g. seismic surveys) and invasive (e.g. exploration wells) exploration activities are classified as having "restricted compatibility". Activities with restricted compatibility require a detailed assessment to determine whether the recommendation is that they should be permitted (general – as is the case for this assessment), permitted subject to additional regulations (consent), or prohibited, depending on a variety of factors. Petroleum production is, however, classified as "not compatible" in CBAs, but may be compatible, subject to certain conditions, in Ecological Support Areas (ESAs). The CBA areas are not considered no-go areas for the purposes of seismic survey activities and TGS would still want to survey these areas. Seismic surveying is not only used for petroleum and natural gas exploration and development. It is also used for development of offshore wind, geothermal energy, and low-carbon solutions such as carbon capture and storage and also more generally for providing more insight and understanding into the regional geology of the area for scientific purposes therefore the CBA areas are not considered no-go areas for the purpose of the seismic survey. In addition, according to the National Coastal and Marine Spatial Biodiversity Plan for the coast and ocean around the South African mainland states that petroleum production may be possible in CBAs using lateral drilling or other techniques that do not result in biodiversity impacts. According to the plan, if significant petroleum resources are identified in these areas, the selection of the site as a CBA could be re-evaluated, although this would require alternative CBAs to be identified to meet biodiversity targets.

No Marine Protected Areas (MPAs) are located within the Application Area. No no-go areas within the Application Area have been identified in any of the specialist studies conducted. As such no layout alternatives or exclusion areas are considered applicable – refer to sensitivity map included as Figure 124 below.

6.3 TECHNOLOGY ALTERNATIVES

The activities proposed in this application require specialised technology and skills. The available technology alternatives are limited by most suitable technology for conducting seismic surveys. To this end, it was concluded by Weilgart (2010) that seismic source design can be optimized to reduce unwanted energy. Imaging deep geological targets requires an acoustic source outputting relatively low frequency content (200Hz) and in directions (both inline and horizontal to the plane of interest) that are not of use. During collection of seismic data for deep imaging purposes one should strive to reduce unnecessary acoustic energy (noise) through array, source, and receiver design optimization. Weilgart (2013) further concluded that that regardless of the imaging target, anyone collecting seismic data should strive to reduce unwanted energy or noise. It should be noted that even if unwanted frequencies (> 200 Hz) are removed, there will still be frequency overlap with several marine animals (including most baleen whales) that can and should be minimized. It was further concluded that, lower source levels could be achieved through better system optimization, i.e. a better pairing of source and receiver characteristics, and better system gain(s). For example, new receiver technologies, such as fibre optic receivers, may allow the use of lower amplitude sources through a higher receiver density and/or a lower system noise

5L28

floor. Some evidence exists which indicates that re-engineered seismic sources with "mufflers" can be used to attenuate unwanted high frequency energy without affecting frequencies of interest. TGS must define and enforce the use of the lowest practicable seismic source volume for production, and design arrays to maximise downward propagation, minimise horizontal propagation and minimise high frequencies in seismic source pulses.

Refer to the detailed mitigation measures included in the EMPr (Appendix 5) for recommendations regarding source design. The above optimisation techniques should be implemented including better seismic source design and system optimisation with the selected survey contractor. In addition, kerosene free hydro-streamers should be used. It is also important to ensure that 'turtle-friendly' tail buoys are used or that existing tail buoys are fitted with either exclusion or deflector 'turtle guards'.

6.4 SCHEDULING ALTERNATIVES

Based on the findings of the Acoustics, Marine Ecology and Fisheries recommendations, it is recommended that the survey window of January – May be utilised in order to:

- Avoid sensitive areas and periods for some marine fauna: Movement of migratory cetaceans (particularly baleen whales) from their southern feeding grounds into low latitude waters (June/July and late October/November), and their aggregation on the summer feeding grounds between St Helena Bay and Dassen Island from late October to late December and ensure that migration paths are not blocked by seismic operations;
- Avoid periods of peak fishing activity during June and July in order to reduce the probability of disruption to the large pelagic longline fishing sector and tuna pole line fishing sector.

6.5 NO GO ALTERNATIVE

The no go alternative would imply that no seismic survey activities are undertaken. As a result, the opportunity to identify potential oil and gas resources within the Application Area would not exist. This will negate the potential negative and positive impacts associated with the proposed survey activities.

5123

7 STAKEHOLDER ENGAGEMENT

The Public Participation Process (PPP) is a requirement of several pieces of South African legislation and aims to ensure that all relevant interested and Affected Parties (I&APs) are consulted, involved and their comments are considered, and a record included in the reports submitted to the Authorities. The process ensures that all stakeholders are provided this opportunity as part of a transparent process which allows for a robust and comprehensive environmental study. The PPP for the proposed project needs to be managed sensitively and according to best practises to ensure and promote:

- Compliance with international best practice options;
- Compliance with national legislation;
- Establishment and management of relationships with key stakeholder groups; and
- Involvement and participation in the environmental study and authorisation/approval process.

As such, the purpose of the PPP and stakeholder engagement process is to:

- Introduce the proposed project;
- Explain the authorisations required;
- Explain the environmental studies already completed and yet to be undertaken (where applicable);
- Solicit and record any issues, concerns, suggestions, and objections to the project;
- Provide opportunity for input and gathering of local knowledge;
- Establish and formalise lines of communication between the I&APs and the project team;
- Identify all significant issues for the project; and
- Identify possible mitigation measures or environmental management plans to minimise and/or prevent negative environmental impacts and maximize and/or promote positive environmental impacts associated with the project.

7.1 GENERAL APPROACH TO PUBLIC PARTICIPATION

The PPP for the proposed project has been undertaken in accordance with the requirements of the NEMA EIA Regulations (2014), and in line with the principles of Integrated Environmental Management (IEM). IEM implies an open and transparent participatory process, whereby stakeholders and other I&APs are afforded an opportunity to comment on the project and have their views considered and included as part of project planning.

An initial I&AP database has been compiled based on known key I&AP's and stakeholder databases available from existing sources. The I&AP database includes amongst others, adjacent landowners, rights holders, communities, regulatory authorities and other special interest groups.

7.1.1 LIST OF PRE-IDENTIFIED ORGANS OF STATE/ KEY STAKEHOLDERS IDENTIFIED AND NOTIFIED

Pre-identified Key Stakeholders were notified of the proposed project and include:

- Abalobi
- Africa Conservation Trust
- Afriforum
- Agri Westcape
- Anglo American
- Aukotowa Fishing Co-Op
- Iziko Museums of South Africa
- Japan Marine Supplies & Services
- Jayfish cc
- Kernel Marine (Pty) Ltd
- Khulani Fishing (Pty) Ltd
- Kobush

309

- Birdlife
- Centre for Environmental Rights
- Chapmans Peak Fisheries
- Cochoqua Tribal Authority
- Combined Fishing Enterprise cc
- Community Processors and Distributors (Pty) Ltd
- Conservation South Africa
- Council for Geoscience
- CSIR
- Dangle Conservancy
- De Beers Group of Companies
- EarthLife Africa
- Endangered Wildlife Trust
- Eskom Holdings SOC Ltd
- Federation for a Sustainable Environment
- Fisherman Development Organisation
- FishSA
- Frackfree SA
- Fresh Tuna Exporters Association
- Gansbaai Marine (Pty) Ltd
- Green Connection
- GroundWork SA
- Hickisons Fishing Company Ltd
- Hondeklip Bay Women's Group
- Hondeklipbaai Visserye Bpk.
- iAfrica
- iGas
- Ikamva Lethu Fishing Company (Pty) Ltd
- Imbize
- Impact Oil and Gas
- Impala Fishing (Pty) Ltd
- Inert Fas Industries
- Ingwe Emnyama Fishing Enterprises (Pty) Ltd
- IRASA Kholsan
- Irvin & Johnson Limited
- Local Ward Councillors
- Lucky Star
- Masifundise Development Trust
- NamaquaRIGHTS
- Natural Justice
- Namibian Government
- North Western Cape Mining Forum
- Observatory Civic Organisation
- Oceana Group Limited
- Oceans Not Oil
- Pescalura
- PetroSA
- Port Nolloth Abalone
- Port Nolloth Fish Factory
- Port Nolloth Fisheries
- Port Nolloth Sea Farm Ranching
- Premier Fishing
- Premier Fishing (SA) (Pty) Ltd
- Protect the West Coast
- Quayside Fish Suppliers Cape (Pty) Ltd
- Reiga Visserye cc
- Risar Fishing
- SA Foundation for the Conservation of Coastal Bird
- SA Tuna Association
- SA Tuna Longline Association
- South African Navy Hydrographic Office
- South African National Biodiversity Institute
- South African Maritime Safety Association
- South African Pelagic Fishing Industry Association
- South African United Fishing Front
- Sunbird Energy
- Sungu Sungu Petroleum
- Thombo Petroleum/Africa Energy corp
- Transnet SOC Ltd
- West Coast National Park

- Isinde Tlent (Pty) Ltd
- World Wildlife Fund

Pre-identified authorities were notified of the proposed project and include:

- Bergrivier Local Municipality
- Cape Nature
- Cederberg Local Municipality
- City of Cape Town Metropolitan
- Eskom SOC ltd
- Heritage Western Cape
- Kamiesberg Local Municipality
- Matzikama Local Municipality
- Nama Khoi Local Municipality
- Namakwa District Municipality
- National Department of Agriculture, Land Reform and Rural Development
- National Department of Forestry, Fisheries and the Environment
- National Department of Mineral Resources
- National Department of Public Works
- National Department of Social Development
- National Department of Transport
- National Department of Water and Sanitation; and
- National Energy Regulator of South Africa
- Northern Cape Department of Nature and Conservation
- Northern Cape Provincial Heritage Resource Agency
- Petroleum Agency of South Africa
- Ritchersveld Local Municipality
- Saldanha Bay Local Municipality
- SANPARKS
- South African Heritage Resources
- Swartland Local Municipality
- West Coast District Municipality
- West Coast Marine Conservation Society
- Western Cape Department of Environmental Affairs and Development Planning

7.1.2 INITIAL NOTIFICATION

The PPP commenced on 16 August 2022 with an initial notification and call to register for a period of 30 days. The initial notification was given in the following manner:

7.1.2.1 REGISTERED LETTERS, FAXES AND EMAILS

Notification letters (English, isiXhosa and Afrikaans), faxes, and emails were distributed to all pre-identified key I&APs including government organisations, NGOs, relevant municipalities, ward councillors, landowners and other organisations that might be affected.

The notification letters included the following information to I&APs:

- List of anticipated activities to be authorised;
- Scale and extent of activities to be authorised;
- Information on the intended reconnaissance operation to enable I&APs to assess/surmise what impact the activities will have on them or on the use of their land;
- The purpose of the proposed project;
- Details of the affected properties (including details of where a locality map could be obtained);
- Details of the relevant regulations;

5608

- Initial registration period timeframes; and
- Contact details of the EAP.

7.1.2.2 NEWSPAPER ADVERTISEMENTS / GOVERNMENT GAZETTE

Advertisements describing the proposed project and EIA process were placed in newspapers with circulation in the vicinity of the study area. The initial advertisements were placed in Cape Times (English and isiXhosa), Sentinel News (English and Afrikaans), Weslander (English and Afrikaans), Ons Kontrei (English and Afrikaans), and Die Plattelander (English and Afrikaans) as well as in the National Gazette. The newspaper adverts included the following information:

- Project name;
- Applicant name;
- Project location;
- Nature of the activity and application;
- Details of initial round of public meetings; and
- Relevant EIMS contact person for the project.

7.1.2.3 SITE NOTICE PLACEMENT

A1 Correx site notices in English, Afrikaans and isiXhosa were placed at 100 onshore locations adjacent to the application area during the week of 16-20 August 2022. The on-site notices included the following information:

- Project name;
- Applicant name;
- Project location;
- Map of proposed project area;
- Project description;
- Legislative requirements;
- Details of initial round of public meetings; and
- Relevant EIMS contact person for the project.

7.1.2.4 POSTER PLACEMENT

A3 posters in English, Afrikaans and isiXhosa were placed at local public gathering places at various onshore locations. The notices and written notification afforded all pre-identified I&APs the opportunity to register for the project as well as to submit their issues/queries/concerns and indicate the contact details of any other potential I&APs that should be contacted. The contact person at EIMS, contact number, email and faxes were stated on the posters. Comments/concerns and queries were encouraged to be submitted in either of the following manners:

- Electronically (fax, email);
- Telephonically; and/or
- Written letters.

7.1.2.5 RADIO ADVERTS

Radio adverts were aired notifying I&APs of the project on the following radio stations:

- KFM (English);
- Radio NFM (English and Afrikaans);

- Radio Namakwaland (English and Afrikaans); and
- Radio West Coast (English and isiXhosa).

7.1.3 AVAILABILITY OF BA REPORT

Notification regarding the availability of this BA Report for public review will be given in the following manner to all registered I&APs (which includes key stakeholders and landowners):

- Registered letters with details on where the report can be obtained and/or reviewed, public meeting date and time, EIMS contact details as well as the public review comment period;
- Facsimile notifications with information similar to that in the registered letter described above; and/or
- Email notifications with a letter attachment containing the information described above.

This BA report is being made available for public review from 21 October 2022 to 21 November 2022. Hard copies of the report are available at the following venues:

- The Hout Bay Public Library (Melkhout Crescent, Hout Bay, Cape Town, Western Cape)
- The Sea Point Public Library (Civic Centre, Cor Three Anchor Bay and Main roads, Sea Point, Cape Town, Western Cape)
- The Vredenburg Public Library (2 Academy Street,(close to West Coast College), Vredenburg, West Coast, Western Cape)
- The Lamberts Bay Public Library (Church Street, Lamberts Bay, Western Cape)
- Kamiesburg Local Municipality in Hondeklip Bay (Wag Wey street)
- J Bekeur Library (Robson St, Port Nolloth, Richtersveld, Northern Cape)

The report is also available for review and download at www.eims.co.za. Data free access to the report download was also available to those I&APs who required such. The executive summary has also been made available in English, Afrikaans and isiXhosa.

7.1.4 PUBLIC MEETINGS

A series of initial public meetings were held between from 29 August 2022 to 5 September 2022 at the following venues:

- Hout Bay: Hout Bay Public Library (Monday, 29 August 2022 at 16:00 – 18:00);
- Cape Town: Life Church (Tuesday, 30 August 2022 at 16:00 – 18:00);
- Saldanha: Hoedjies Bay Hotel (Wednesday, 31 August 2022 at 16:00 – 18:00);
- Lamberts Bay: Community Hall (Thursday, 1 September 2022 at 16:00 – 18:00);
- Hondeklip Bay: Eric Baker Hall (Friday, 2 September 2022 at 16:00 – 18:00); and
- Port Nolloth: Port Nolloth Country Club (Saturday, 3 September 2022 at 10:00 – 12:00).

The aim of the first round of public meetings was to ensure as many concerns and issues were captured prior to release of the draft BA report. This was done in order to ensure that the BA report addresses as many of the potential concerns from the public and affected stakeholders as possible. A second round of public meetings is scheduled for during the review period of this draft BA report.

Figure 6: Protest held outside the venue of the Initial Port Nolloth Public Meeting on 3 September 2022.

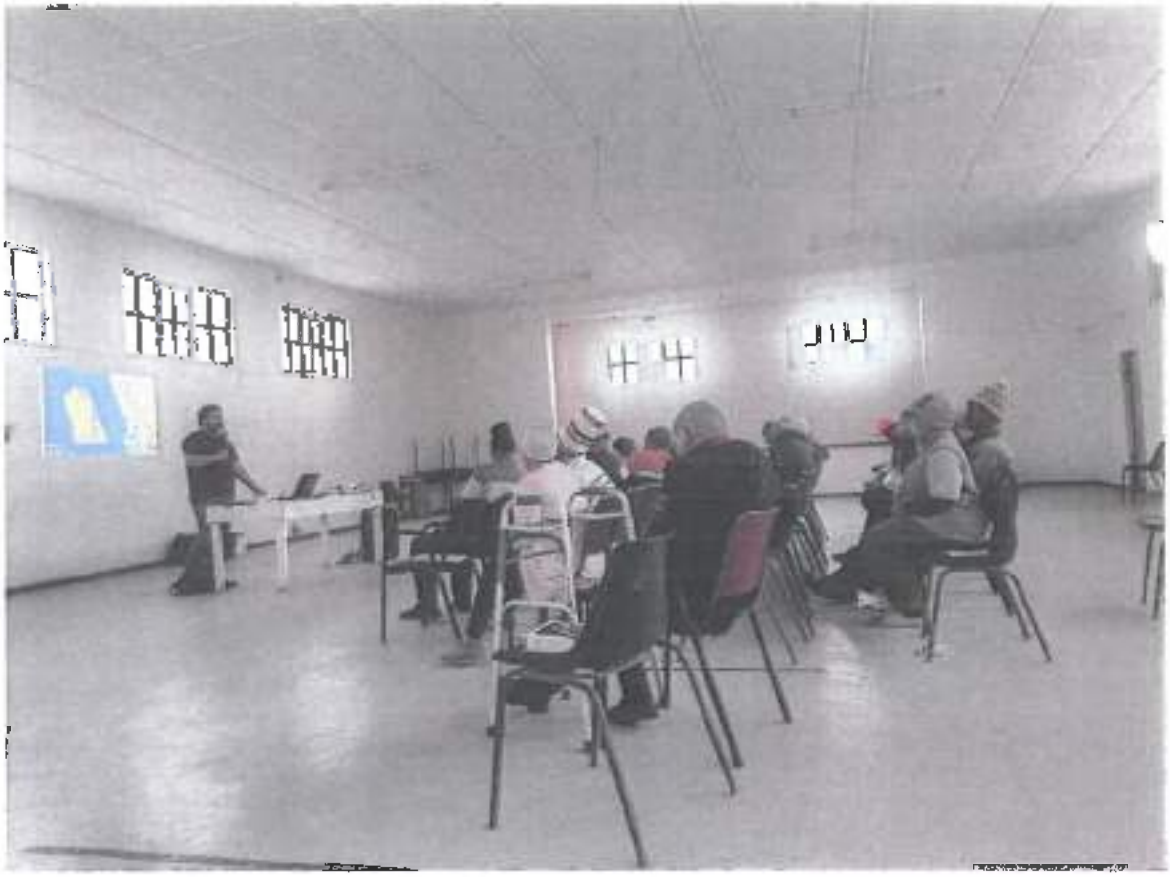

Figure 7: Public Meeting held in Hondeklip Bay on 1 September 2022.

Figure 8: Public Meeting held in Lamberts Bay on 1 September 2022.

7.1.5 FOCUS GROUP MEETINGS

In addition to the above, a number of focus group meetings and other interviews were undertaken by the Social and Heritage Specialists as part of their assessments. Please refer to the Social and Heritage Specialist Reports in Appendix B for further details.

7.2 PUBLIC PARTICIPATION PROGRESS

Comments raised to date have been addressed in a transparent manner and included in the Public Participation Report (Appendix 2). A high-level summary of the key comments and concerns raised to date are presented below.

- I&AP registrations and deregistration;
- Notification/information document requests;
- Notification of I&APs registered on the previous Searcher application database;
- Effects on migratory patterns along the West Coast;
- Long term marine life impact if the survey finds exploitable resources;
- Impacts on marine life between the survey site and the coast and how this will impact the future of tourism and agriculture;
- Climate change impacts associated with oil and gas;
- Effects on fisheries and catch rates;
- Food security;
- Free Prior and Informed Consent in public participation processes;

- Public Consultation Process as a "tick box exercise";
- Impact on indigenous cultural heritage, historical connection to the sea;
- Overlap between the Searcher and TGS application areas;
- Lessons learnt from the Searcher and Shell court cases;
- EIMS' independence if the applicant pays for the services rendered;
- Free Prior and Informed Consent in public participation processes;
- Alternative technologies to seismic surveys;
- Requests for mapping data;
- Objections to the proposed TGS Seismic Survey;
- Cumulative impacts;
- Need and desirability of seismic surveys;
- EIA process related comments;
- A lot of the communities are very poor. Concern that there will be no economic benefits for the communities as a direct result of the survey;
- Impact on livelihoods of the coastal communities; and
- The need for an Strategic Environmental Assessment (SEA).

Seismic reconnaissance projects are controversial in South Africa and has been in the news frequently in the last year. For many stakeholders it is an emotional matter, for others the potential of impacting their livelihoods is the biggest fear. There are also stakeholders that feel that the exploration for fossil fuels is not in line with sustainable development and the fight against climate change. Other stakeholders feel that it is imperative for the growth and development of the South African economy to engage in these investigations.

8 ENVIRONMENTAL BASELINE ASSESSMENT

8.1 LOCATION

The Application Area is located between approximately 120 km offshore of St Helena Bay, extending north along the western coastline to approximately 230 km offshore of Hondeklip Bay over a number of petroleum licence blocks. The locality of the proposed Application Area is shown in Figure 1.

8.2 GEOPHYSICAL CHARACTERISTICS

This section provides a description of the geophysical characteristics of the application area. The information has been sourced from the Marine Ecological Study undertaken by Pisces Environmental Services (Pty) Ltd included in Appendix 3.

8.2.1 BATHYMETRY

The continental shelf along the West Coast is generally wide and deep, although large variations in both depth and width occur. The shelf maintains a general NNW trend, widening north of Cape Columbine and reaching its widest off the Orange River (180 km) (Figure 9). The nature of the shelf break varies off the South African West Coast. Between Cape Columbine and the Orange River, there is usually a double shelf break, with the distinct inner and outer slopes, separated by a gently sloping ledge. The immediate inshore[1] area consists mainly of a narrow (about 8 km wide) rugged rocky zone and slopes steeply seawards to a depth of around 80 m. The middle (-80 to -150 m) and outer shelf (-150 to -350 m) normally lacks relief and slopes gently seawards reaching the shelf edge at a depth of between -350 to -500 m (Sink *et al.* 2019). The three shelf zones characterising the West Coast are recognised following both abiotic (de Wet 2013) and biotic (Karenyi *et al.* 2016) patterns.

Banks on the continental shelf include the Orange Bank (Shelf or Cone), a shallow (180 - 190 m) zone that reaches maximal widths (180 km) offshore of the Orange River, and Child's Bank, situated ~150 km offshore at about 31°S, and within the northern portion of the project target area. Child's Bank is a major feature on the West Coast margin and is the only known submarine bank within South Africa's Exclusive Economic Zone (EEZ), rising from a depth of 350 - 400 m water to less than -200 m at its shallowest point. It is a rounded, flat topped, sandy plateau, which lies at the edge of the continental shelf. The bank has a gentle northern, eastern and southern margin but a steep, slump-generated outer face (Birch & Rogers 1973; Dingle *et al.* 1989; de Wet 2013). At its southwestern edge, the continental slope drops down steeply from -350 to -1 500 m over a distance of less than 60 km (de Wet 2013) creating precipitous cliffs at least 150 m high (Birch & Rogers 1973). The bank consists of resistant, horizontal beds of Pliocene sediments, similar to that of the Orange Banks, and represents another perched erosional outlier formed by post-Pliocene erosion (Dingle 1973; Siesser *et al.* 1974). The top of this feature has been estimated to cover some 1 450 km² (Sink *et al.* 2012).

Tripp Seamount, a geological feature ~25 km to the north of the Reconnaissance Permit area, rises from the seabed at ~1 000 m to a depth of 150 m. It is a roughly circular feature with a flat apex that drops steeply on all sides.

Further underwater features in the vicinity of the Reconnaissance Permit Area include the Cape Canyon and Cape Point Valley, which lie ~95 km and ~250 km to the southeast of the southern boundary of the Reconnaissance Permit Area (Simpson & Forder 1968; Dingle 1986; Wigley 2004; Wigley & Compton 2006). The Cape Canyon was discovered in the 1960s. The canyon head forms a well-developed trench on the continental shelf, 100 m deep and 4 km wide (Wigley 2004; Wigley & Compton 2006). South of Cape Columbine the canyon becomes progressively narrower and deeper. Adjacent to Cape Town in a water depth of 1 500 m, the canyon has a local relief in the order of 500–800 m (Simpson & Forder 1968; Dingle *et al.* 1987). The Cape Canyon has a longitudinal extent of at least 200 km and can be traced to a water depth of at least 3 600 m (Dingle 1970), where the topography of the distal end is rugged and complex (Dingle *et al.* 1987). Sediments in the canyon are predominately unconsolidated sands and muds. The canyon serves as an upwelling feature funnelling cold, nutrient-rich South Atlantic Central Water up the canyon slope providing highly productive surface waters which

[1] As per the 2019 National Biodiversity Assessment inshore is defined as the area influenced by wave energy and light, with the fair-weather wave base at a depth ranging between -30 to -50 m used to determine the outer limits of the zone in South Africa. Offshore areas are those that extend beyond this zone.

in turn power feeding grounds for cetaceans and seabirds (Pilander et al 2018; www.environment.gov.za/deareseachteamreturnfromdeepseaexpedition).

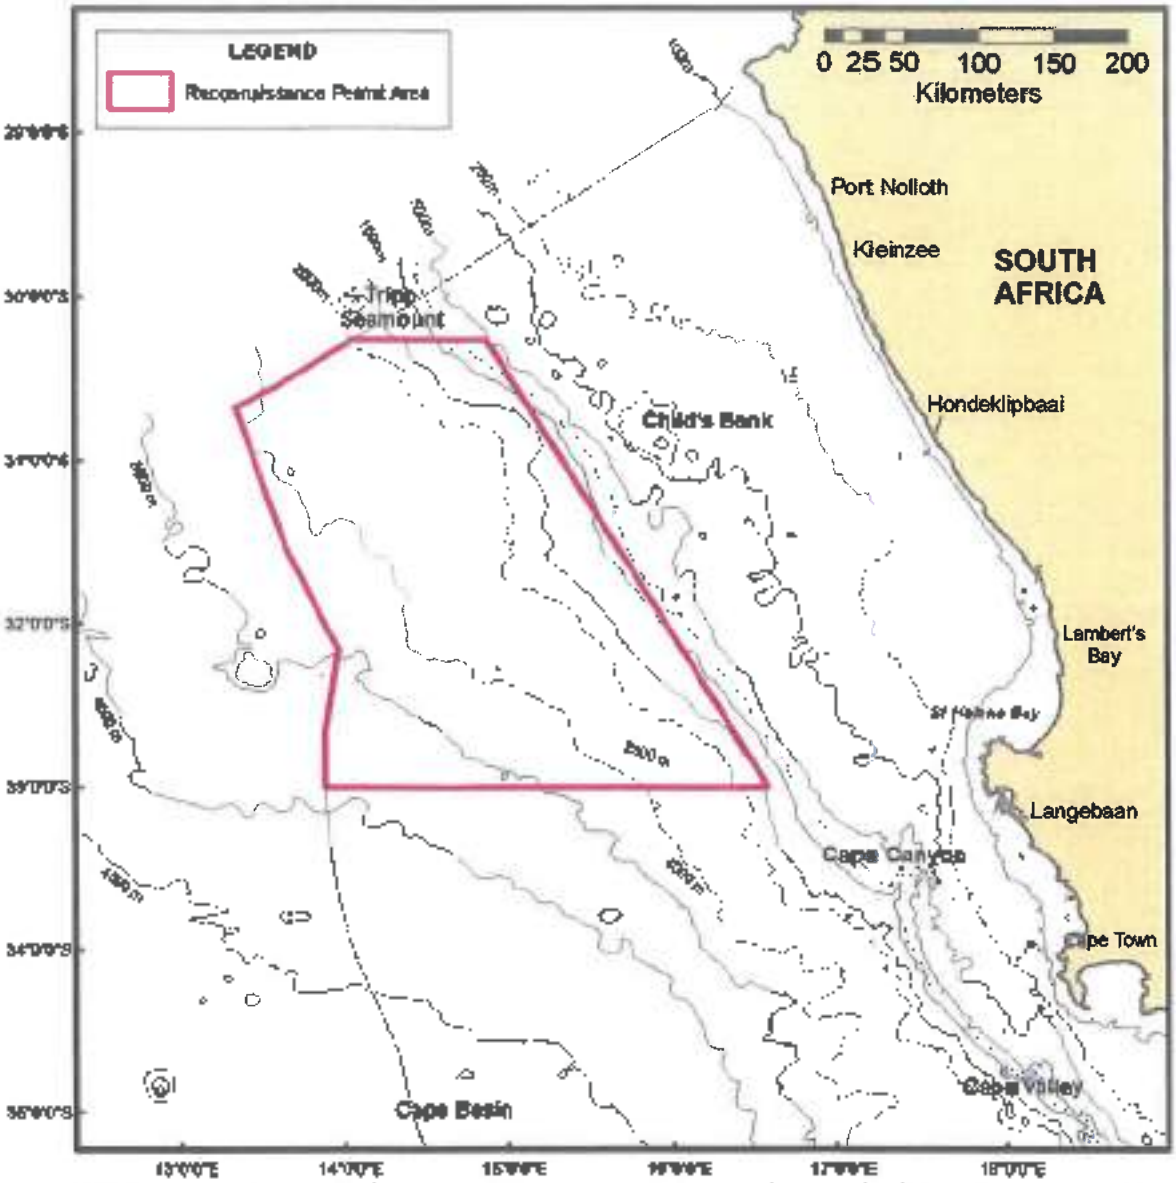

Figure 9: Map indicating location of the Reconnaissance Permit Area in relation to bathymetric features off the West Coast.

The Cape Point Valley, which lies about 70 km south of the Cape Peninsula, is another large canyon breaching the shelf. This canyon has sustained the highest fishing effort and catches in the South African demersal trawl fishery for almost a century (www.marineprotectedareas.org.za/canyons).

Using high-resolution bathymetry collected between 315 – 3 125 m depth, Polan (2017) identified numerous new and previously undocumented submarine canyon systems, most of which are less extensive than the Cape Canyon and Cape Point Valley and do not incise the shelf (Figure 10). Canyon morphology was highly variable and included linear, sinuous, hooked and shelf-indenting types. Large fluid seep/pockmark fields of varying morphologies were similarly revealed situated in close proximity to the sinuous, hooked and shelf-indenting canyon types thereby providing the first evidence of seafloor fluid venting and escape features from the South African margin. These pockmarks represent the terminus of stratigraphic fluid migration from an Aptian gas reservoir, evidenced in the form of blowout pipes and brightened reflectors. This area lies well to the southeast of the Reconnaissance Permit Area.

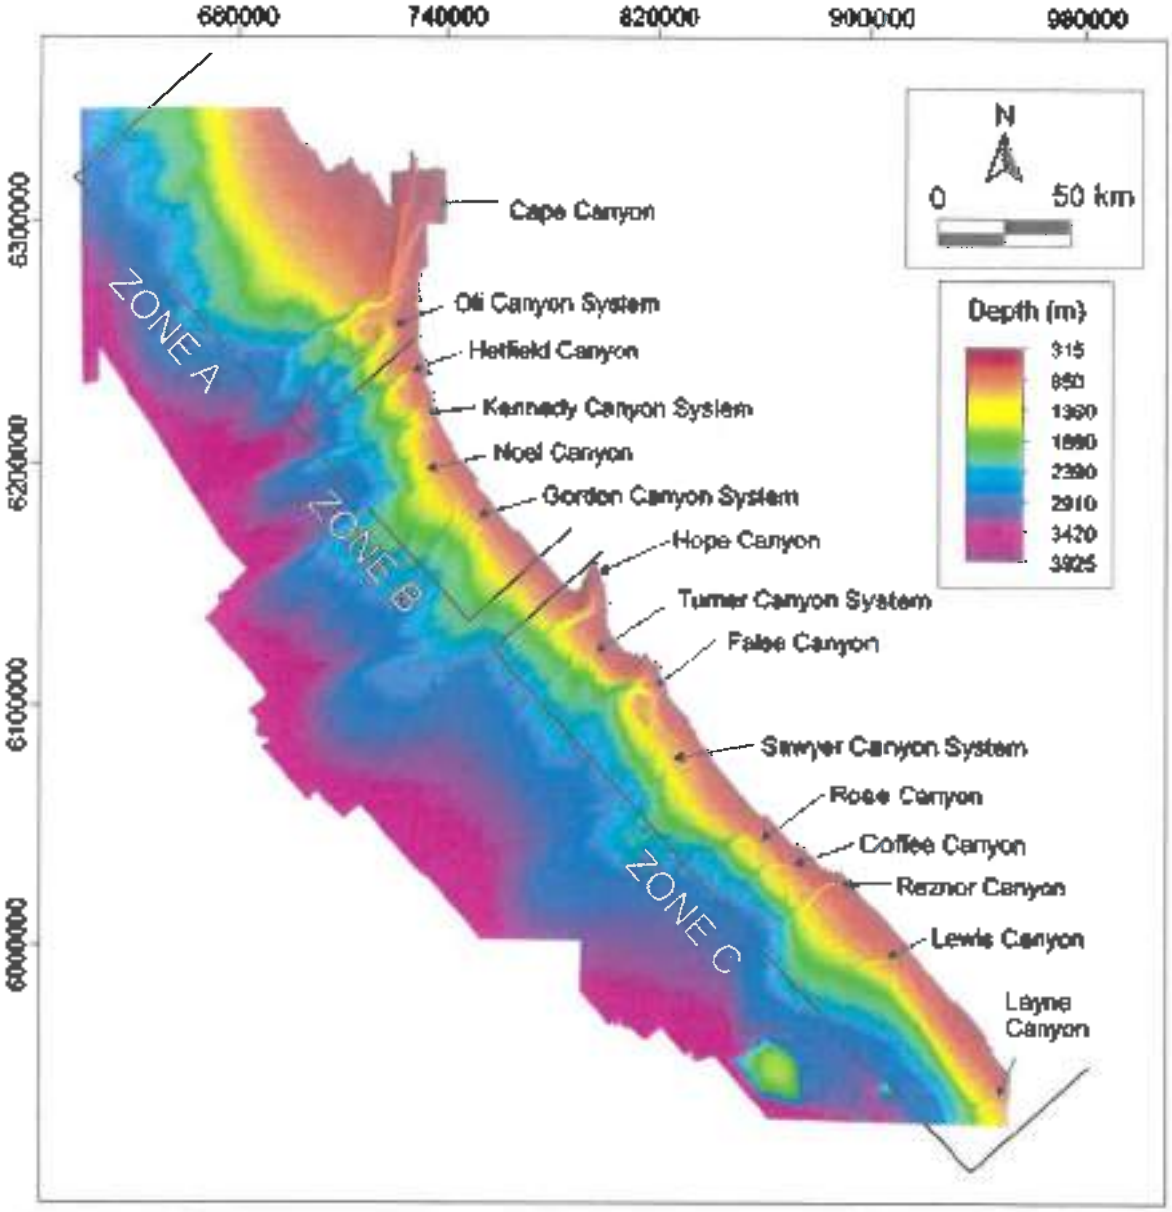

Figure 10: Submarine canyon domains of the southwestern Cape continental margin identified by Palan (2017).

8.2.2 COASTAL AND INNER-SHELF GEOLOGY AND SEABED GEOMORPHOLOGY

Figure 11 below illustrates the distribution of seabed surface sediment types off the South African north-western coast. The inner shelf is underlain by Precambrian bedrock (Pre-Mesozoic basement), whilst the middle and outer shelf areas are composed of Cretaceous and Tertiary sediments (Dingle 1973; Dingle *et al.* 1987; Birch et *al.* 1976; Rogers 1977; Rogers & Bremner 1991). As a result of erosion on the continental shelf, the unconsolidated sediment cover is generally thin, often less than 1 m. Sediments are finer seawards, changing from sand on the inner and outer shelves to muddy sand and sandy mud in deeper water. However, this general pattern has been modified considerably by biological deposition (large areas of shelf sediments contain high levels of calcium carbonate) and localised river input. An ~500-km long mud belt (up to 40 km wide, and of 15 m average thickness) is situated over the inner shelf between the Orange River and St Helena Bay (Birch *et al.* 1976). Further offshore and within the Reconnaissance Permit Area, sediment is dominated by muds and sandy muds. The continental slope, seaward of the shelf break, has a smooth seafloor, underlain by calcareous ooze.

Present day sedimentation is limited to input from the Orange River. This sediment is generally transported northward. Most of the sediment in the area is therefore considered to be relict deposits by now ephemeral rivers active during wetter climates in the past. The Orange River, when in flood, still contributes largely to the

mud belt as suspended sediment is carried southward by poleward flow. In this context, the absence of large sediment bodies on the inner shelf reflects on the paucity of terrigenous sediment being introduced by the few rivers that presently drain the South African West Coast coastal plain.

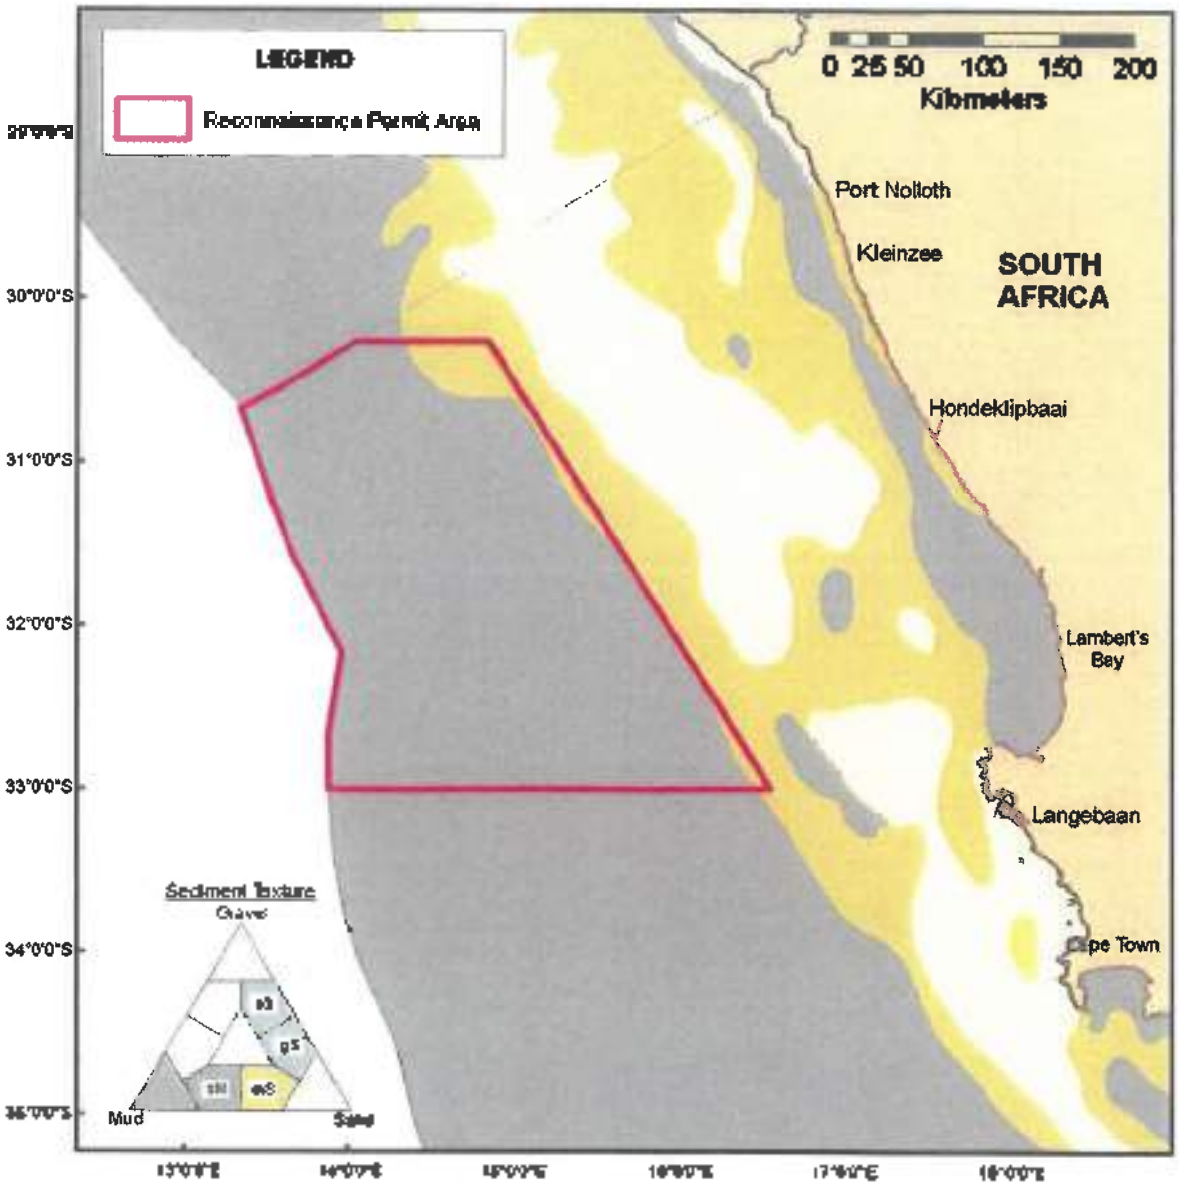

Figure 11: The Reconnaissance Permit Area in relation to sediment distribution on the continental shelf of the South African West Coast (Adapted from Rogers 1977). Based on information in Holness *et al.* (2014) and Sink *et al.* [2019], the mud/sandy mud sediments have been extended to the edge of the EEZ beyond that shown in Rogers (1977).

The benthic habitat types of the West Coast were classified and mapped in detail through the 2011 National Biodiversity Assessment (NBA) (Sink *et al.* 2012a). These were refined in the 2018 NBA (Sink *et al.* 2019) to provide substratum types (Figure 12 below).

In the Reconnaissance Permit Area the water depth ranges from ~500 m to nearly 4 000 m. The Southeast Atlantic Unclassified Slopes and Southeast Atlantic Unclassified Abyss substrata dominate across the area. The shelf inshore of the Reconnaissance Permit Area boasts a diversity of substrata (Sink *et al.* 2019).

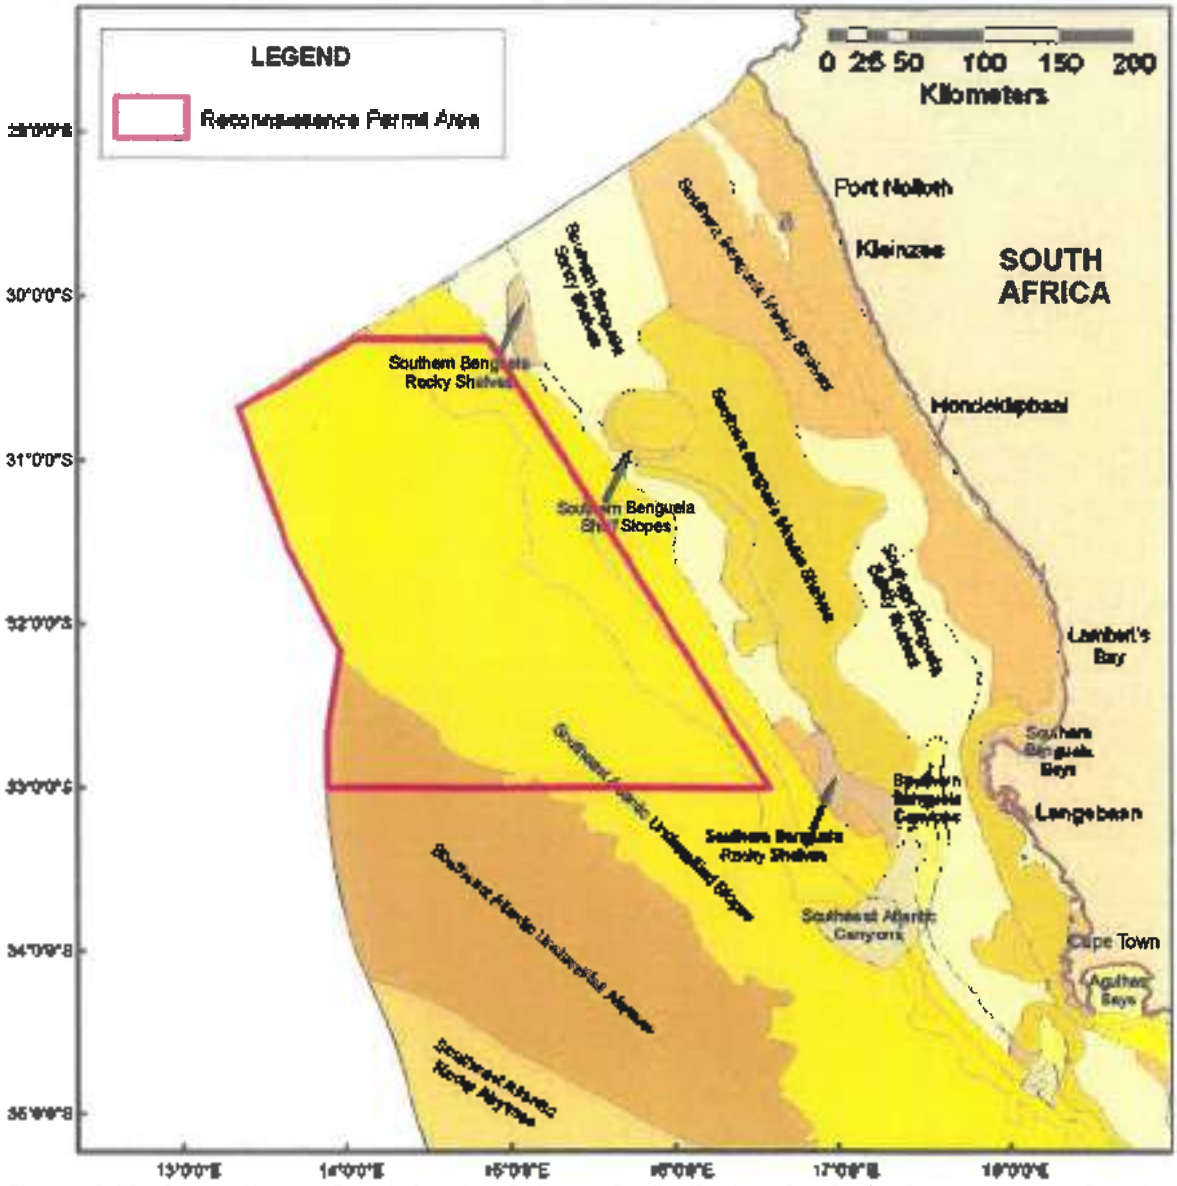

Figure 12: The Reconnaissance Permit Area in relation to the distribution of seabed substratum types along the West Coast (adapted from Sink *et al.* 2019).

8.3 BIOPHYSICAL CHARACTERISTICS

This section provides a description of the biophysical characteristics of the application area. The information has been sourced from the Marine Ecological Study undertaken by Pisces Environmental Services (Pty) Ltd included in Appendix 3.

8.3.1 WIND PATTERNS

Winds are one of the main physical drivers of the nearshore Benguela region, both on an oceanic scale, generating the heavy and consistent south-westerly swells that impact this coast, and locally, contributing to the northward-flowing longshore currents, and being the prime mover of sediments in the terrestrial environment. Consequently, physical processes are characterised by the average seasonal wind patterns, and substantial episodic changes in these wind patterns have strong effects on the entire Benguela region.

The prevailing winds in the Benguela region are controlled by the South Atlantic subtropical anticyclone, the eastward moving mid-latitude cyclones south of southern Africa, and the seasonal atmospheric pressure field over the subcontinent. The south Atlantic anticyclone is a perennial feature that forms part of a discontinuous belt of high-pressure systems which encircle the subtropical southern hemisphere. This undergoes seasonal

variations, being strongest in the austral summer, when it also attains its southernmost extension, lying southwest and south of the subcontinent. In winter, the south Atlantic anticyclone weakens and migrates north-westwards.

These seasonal changes result in substantial differences between the typical summer and winter wind patterns in the region, as the southern hemisphere anti-cyclonic high-pressures system, and the associated series of cold fronts, moves northwards in winter, and southwards in summer. The strongest winds occur in summer (October to March), during which winds blow 98% of the time (PRDW 2013), with a total of 226 gales (winds exceeding 18 m/s or 35 kts) being recorded over the period (CSIR 2006). Virtually all winds in summer come from the south to south-southeast (Figure 13). These southerlies occur over 40% of the time, averaging 20 – 30 kts and reaching speeds in excess of 60 kts, bringing cool, moist air into the coastal region and driving the massive offshore movements of surface water, and the resultant strong upwelling of nutrient-rich bottom waters, which characterise this region in summer. The winds also play an important role in the loss of sediment from beaches. These strong equator-wards winds are interrupted by the passing of coastal lows with which are associated periods of calm or north or northwest wind conditions. These northerlies occur throughout the year, but are more frequent in winter.

Winter remains dominated by southerly to south-easterly winds, but the closer proximity of the winter cold-front systems results in a significant south-westerly to north-westerly component (Figure 13). This 'reversal' from the summer condition results in cessation of upwelling, movement of warmer mid-Atlantic water shore-wards and breakdown of the strong thermoclines which typically develop in summer. There are also more calms in winter, occurring about 3% of the time, and wind speeds generally do not reach the maximum speeds of summer. However, the westerly winds blow in synchrony with the prevailing south-westerly swell direction, resulting in heavier swell conditions in winter.

During autumn and winter, catabatic, or easterly 'berg' winds can also occur. These powerful offshore winds can exceed 50 km/h, producing sandstorms that considerably reduce visibility at sea and on land. Although they occur intermittently for about a week at a time, they have a strong effect on the coastal temperatures, which often exceed 30°C during 'berg' wind periods (Shannon & O'Toole 1998). The winds also play a significant role in sediment input into the coastal marine environment with transport of the sediments up to 150 km offshore.

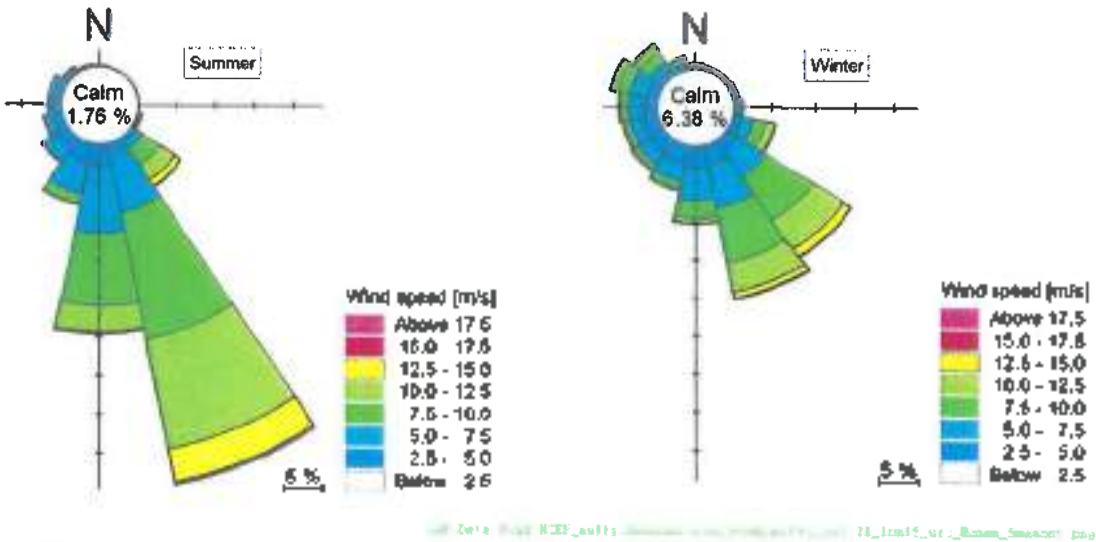

Figure 13: Wind Speed vs. Wind Direction for NCEP hind cast data at location 15°E, 31°S (From PRDW 2013).

8.3.2 LARGE-SCALE CIRCULATION AND COASTAL CURRENTS

The southern African West Coast is strongly influenced by the Benguela Current. Current velocities in continental shelf areas generally range between 10–30 cm/s (Boyd & Oberholster 1994), although localised flows in excess of 50 cm/s occur associated with eddies (PRDW 2013). On its western side, flow is more transient and characterised by large eddies shed from the retroflection of the Agulhas Current. This results in considerable variation in current speed and direction over the domain (PRDW 2013). In the south the Benguela current has a width of 200 km, widening rapidly northwards to 750 km. The surface flows are predominantly wind-forced, barotropic and fluctuate between poleward and equatorward flow (Shillington *et al*. 1990; Nelson & Hutchings

1983) (Figure 14b). Fluctuation periods of these flows are 3 - 10 days, although the long-term mean current residual is in an approximate northwest (alongshore) direction. Current speeds decrease with depth, while directions rotate from predominantly north-westerly at the surface to south-easterly near the seabed. Near bottom shelf flow is mainly poleward with low velocities of typically <5 cm/s (Nelson 1989; PRDW 2013). The poleward flow becomes more consistent in the southern Benguela.

The major feature of the Benguela Current is coastal upwelling and the consequent high nutrient supply to surface waters leads to high biological production and large fish stocks. The prevailing longshore, equatorward winds move nearshore surface water northwards and offshore. To balance the displaced water, cold, deeper water wells up inshore. Although the rate and intensity of upwelling fluctuates with seasonal variations in wind patterns, the most intense upwelling tends to occur where the shelf is narrowest and the wind strongest. There are three upwelling centres in the southern Benguela, namely the Namaqua (30°S), Cape Columbine (33°S) and Cape Point (34°S) upwelling cells (Taunton-Clark 1985) (Figure 14a). Upwelling in these cells is seasonal, with maximum upwelling occurring between September and March. Both the Reconnaissance Permit area and the 3D Application Area are located offshore of these upwelling events.

Where the Agulhas Current passes the southern tip of the Agulhas Bank (Agulhas Retroflection area), it may shed a filament of warm surface water that moves north-westward along the shelf edge towards Cape Point, and Agulhas Rings, which similarly move north-westwards into the South Atlantic Ocean (Figure 14). These rings may extend to the seafloor and west of Cape Town may split, disperse or join with other rings. During the process of ring formation, intrusions of cold subantarctic water moves into the South Atlantic. The contrast in warm (nutrient-poor) and cold (nutrient-rich) water is thought to be reflected in the presence of cetaceans and large migratory pelagic fish species (Best 2007). The Reconnaissance Permit Area lies offshore of 15°E on the outer edge of these features.

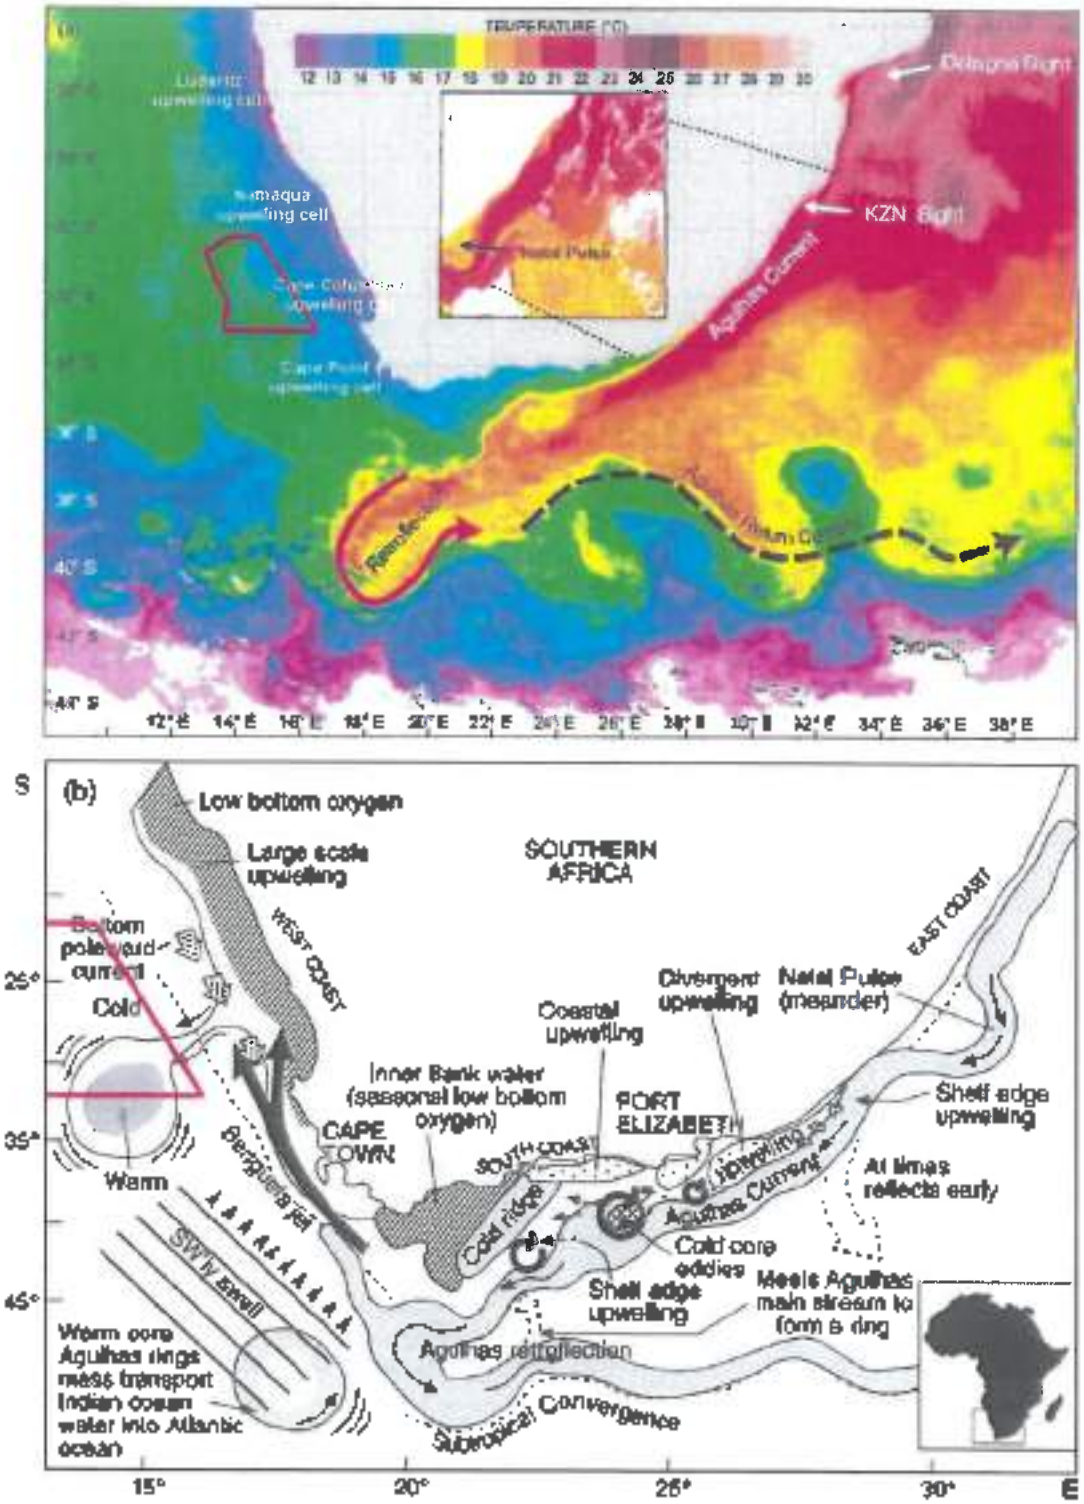

Figure 14: (a) Satellite sea-surface temperature image showing the predominance of the warm Agulhas Current along the South African south coast and the colder upwelled water on the west coast (adapted from Roberts *et al.* 2010), and (b) physical processes and features associated with the Southwest Coast (adapted from Roberts 2005) in relation to the Reconnaissance Permit Area (red polygon).

8.3.3 WAVES AND TIDES

Most of the west coast of southern Africa is classified as exposed, experiencing strong wave action, rating between 13-17 on the 20 point exposure scale (McLachlan 1980). Much of the coastline is therefore impacted

by heavy south-westerly swells generated in the roaring forties, as well as significant sea waves generated locally by the prevailing moderate to strong southerly winds characteristic of the region (Figure 15). The peak wave energy periods fall in the range 9.7 – 15.5 seconds.

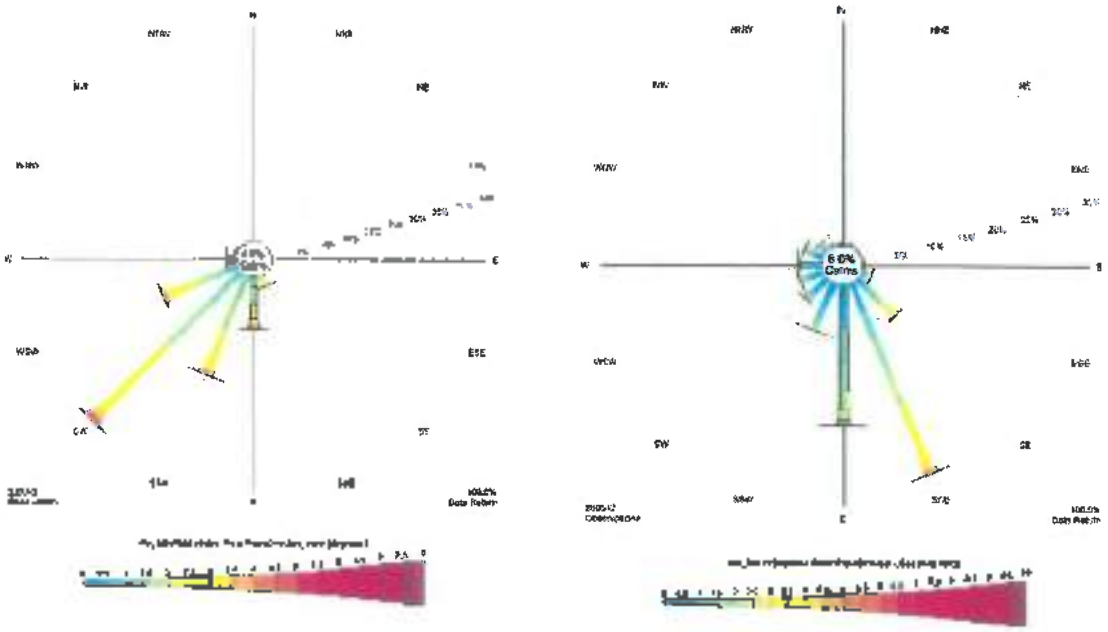

Figure 15: Annual rose plots of significant wave height partitions of swell (left) and wind-sea (right) for GROW1012 hind cast data at location 15°E, 31°S.

The wave regime along the southern African west coast shows only moderate seasonal variation in direction, with virtually all swells throughout the year coming from the S and SSW direction. Winter swells are strongly dominated by those from the S and SSW, which occur almost 80% of the time, and typically exceed 2 m in height, averaging about 3 m, and often attaining over 5 m. With wind speeds capable of reaching 100 km/h during heavy winter south-westerly storms, winter swell heights can exceed 10 m.

In comparison, summer swells tend to be smaller on average, typically around 2 m, not reaching the maximum swell heights of winter. There is also a slightly more pronounced southerly swell component in summer. These southerly swells tend to be wind-induced, with shorter wave periods (~8 seconds), and are generally steeper than swell waves (CSIR 1996). These wind-induced southerly waves are relatively local and, although less powerful, tend to work together with the strong southerly winds of summer to cause the northward-flowing nearshore surface currents, and result in substantial nearshore sediment mobilisation, and northwards transport, by the combined action of currents, wind and waves.

In common with the rest of the southern African coast, tides are semi-diurnal, with a total range of some 1.5 m at spring tide, but only 0.6 m during neap tide periods.

8.3.4 WATER

South Atlantic Central Water (SACW) comprises the bulk of the seawater in the study area, either in its pure form in the deeper regions, or mixed with previously upwelled water of the same origin on the continental shelf (Nelson & Hutchings 1983). Salinities range between 34.5‰ and 35.5‰ (Shannon 1985).

Seawater temperatures on the continental shelf of the southern Benguela typically vary between 6°C and 16°C. Well-developed thermal fronts exist, demarcating the seaward boundary of the upwelled water. Upwelling filaments are characteristic of these offshore thermal fronts, occurring as surface streamers of cold water, typically 50 km wide and extending beyond the normal offshore extent of the upwelling cell. Such fronts typically have a lifespan of a few days to a few weeks, with the filamentous mixing area extending up to 625 km offshore. South and east of Cape Agulhas, the Agulhas retroflection area is a global "hot spot" in terms of temperature variability and water movements.

The continental shelf waters of the Benguela system are characterised by low oxygen concentrations, especially on the bottom. SACW itself has depressed oxygen concentrations (~80% saturation value), but lower oxygen concentrations (<40% saturation) frequently occur (Bailey *et al.* 1985; Chapman & Shannon 1985).

Nutrient concentrations of upwelled water of the Benguela system attain 20 µM nitrate-nitrogen, 1.5 µM phosphate and 15-20 µM silicate, indicating nutrient enrichment (Chapman & Shannon 1985). This is mediated by nutrient regeneration from biogenic material in the sediments (Bailey *et al.* 1985). Modification of these peak concentrations depends upon phytoplankton uptake, which varies according to phytoplankton biomass and production rate. The range of nutrient concentrations can thus be large but, in general, concentrations are high.

8.3.5 UPWELLING AND PLANKTON PRODUCTION

The cold, upwelled water is rich in inorganic nutrients, the major contributors being various forms of nitrates, phosphates and silicates (Chapman & Shannon 1985). During upwelling the comparatively nutrient-poor surface waters are displaced by enriched deep water, supporting substantial seasonal primary phytoplankton production. This, in turn, serves as the basis for a rich food chain up through zooplankton, pelagic baitfish (anchovy, pilchard, round-herring and others), to predatory fish (hake and snoek), mammals (primarily seals and dolphins) and seabirds (jackass penguins, cormorants, pelicans, terns and others). High phytoplankton productivity in the upper layers again depletes the nutrients in these surface waters. This results in a wind-related cycle of plankton production, mortality, sinking of plankton detritus and eventual nutrient re-enrichment occurring below the thermocline as the phytoplankton decays. The eastern boundary of the Reconnaissance Permit Area is located on the western edge of these upwelling events and although waters are expected to be comparatively warm and nutrient poor, seasonal upwelling inshore of the Reconnaissance Permit Area can be expected (see Figure 14). The Application Area is located well offshore of these upwelling events.

8.3.6 ORGANIC INPUTS

The Benguela upwelling region is an area of particularly high natural productivity, with extremely high seasonal production of phytoplankton and zooplankton. These plankton blooms in turn serve as the basis for a rich food chain up through pelagic baitfish (anchovy, pilchard, round-herring and others), to predatory fish (snoek), mammals (primarily seals and dolphins) and seabirds (jackass penguins, cormorants, pelicans, terns and others). All of these species are subject to natural mortality, and a proportion of the annual production of all these trophic levels, particularly the plankton communities, die naturally and sink to the seabed.

Balanced multispecies ecosystem models have estimated that during the 1990s the Benguela region supported biomasses of 76.9 tons/km^2 of phytoplankton and 31.5 tons/km^2 of zooplankton alone (Shannon *et al.* 2003). Thirty six percent of the phytoplankton and 5% of the zooplankton are estimated to be lost to the seabed annually. This natural annual input of millions of tons of organic material onto the seabed off the southern African West Coast has a substantial effect on the ecosystems of the Benguela region. It provides most of the food requirements of the particulate and filter-feeding benthic communities that inhabit the sandy-muds of this area, and results in the high organic content of the muds in the region. As most of the organic detritus is not directly consumed, it enters the seabed decomposition cycle, resulting in subsequent depletion of oxygen in deeper waters.

An associated phenomenon ubiquitous to the Benguela system are red tides (dinoflagellate and/or ciliate blooms) (see Shannon & Pillar 1985; Pitcher 1998). Also referred to as Harmful Algal Blooms (HABs), these red tides can reach very large proportions, extending over several square kilometres of ocean. Toxic dinoflagellate species can cause extensive mortalities of fish and shellfish through direct poisoning, while degradation of organic-rich material derived from both toxic and non-toxic blooms results in oxygen depletion of subsurface water. Being associated primarily with upwelling cells, HABs may occur in inshore of the Reconnaissance Permit Area, but would not be expected in the Application Area.

8.3.7 LOW OXYGEN EVENTS

The continental shelf waters of the Benguela system are characterised by low oxygen concentrations with <40% saturation occurring frequently (e.g. Visser 1969; Bailey *et al.* 1985). The low oxygen concentrations are attributed to nutrient remineralisation in the bottom waters of the system (Chapman & Shannon 1985). The absolute rate of this is dependent upon the net organic material build-up in the sediments, with the carbon rich mud deposits playing an important role. As the mud on the shelf is distributed in discrete patches (see Figure 12), there are corresponding preferential areas for the formation of oxygen-poor water. The two main areas of

low-oxygen water formation in the southern Benguela region are in the Orange River Bight and St Helena Bay (Chapman & Shannon 1985; Bailey 1991; Shannon & O'Toole 1998; Bailey 1999; Fossing *et al.* 2000). The spatial distribution of oxygen-poor water in each of the areas is subject to short- and medium-term variability in the volume of hypoxic water that develops. De Decker (1970) showed that the occurrence of low oxygen water off Lambert's Bay is seasonal, with highest development in summer/autumn. Bailey & Chapman (1991), on the other hand, demonstrated that in the St Helena Bay area daily variability exists as a result of downward flux of oxygen through thermoclines and short-term variations in upwelling intensity. Subsequent upwelling processes can move this low-oxygen water up onto the inner shelf, and into nearshore waters, often with devastating effects on marine communities.

Periodic low oxygen events in the nearshore region can have catastrophic effects on the marine communities leading to large-scale stranding of rock lobsters, and mass mortalities of marine biota and fish (Newman & Pollock 1974; Matthews & Pitcher 1996; Pitcher 1998; Cockcroft *et al.* 2000). The development of anoxic conditions as a result of the decomposition of huge amounts of organic matter generated by phytoplankton blooms is the main cause for these mortalities and walkouts. The most recent walkout occurred in early March 2022 at Elands Bay, when some 500 tons of rocklobster were reported stranded on the beach. The blooms develop over a period of unusually calm wind conditions when sea surface temperatures where high. Algal blooms usually occur during summer-autumn (February to April) but can also develop in winter during the 'berg' wind periods, when similar warm windless conditions occur for extended periods.

8.3.8 TURBIDITY

Turbidity is a measure of the degree to which the water loses its transparency due to the presence of suspended particulate matter. Total Suspended Particulate Matter (TSPM) can be divided into Particulate Organic Matter (POM) and Particulate Inorganic Matter (PIM), the ratios between them varying considerably. The POM usually consists of detritus, bacteria, phytoplankton and zooplankton, and serves as a source of food for filter-feeders. Seasonal microphyte production associated with upwelling events will play an important role in determining the concentrations of POM in coastal waters. PIM, on the other hand, is primarily of geological origin consisting of fine sands, silts and clays. Off Namaqualand, the PIM loading in nearshore waters is strongly related to natural inputs from the Orange River or from 'berg' wind events. Although highly variable, annual discharge rates of sediments by the Orange River is estimated to vary from 8 - 26 million tons/yr (Rogers 1979). 'Berg' wind events can potentially contribute the same order of magnitude of sediment input as the annual estimated input of sediment by the Orange River (Shannon & Anderson 1982; Zoutendyk 1992, 1995; Shannon & O'Toole 1998; Lane & Carter 1999). For example, a 'berg' wind event in May 1979 described by Shannon and Anderson (1982) was estimated to have transported in the order of 50 million tons of sand out to sea, affecting an area of 20 000 km^2.

Concentrations of suspended particulate matter in shallow coastal waters can vary both spatially and temporally, typically ranging from a few mg/ℓ to several tens of mg/ℓ (Bricelj & Malouf 1984; Berg & Newell 1986; Fegley *et al.* 1992). Field measurements of TSPM and PIM concentrations in the Benguela current system have indicated that outside of major flood events, background concentrations of coastal and continental shelf suspended sediments are generally <12 mg/ℓ, showing significant long-shore variation (Zoutendyk 1995). Considerably higher concentrations of PIM have, however, been reported from southern African West Coast waters under stronger wave conditions associated with high tides and storms, or under flood conditions. In the vicinity of the Orange River mouth, where river outflow strongly influences the turbidity of coastal waters, measured concentrations ranged from 14.3 mg/ℓ at Alexander Bay just south of the mouth (Zoutendyk 1995) to peak values of 7 400 mg/ℓ immediately upstream of the river mouth during the 1988 Orange River flood (Bremner *et al.* 1990).

The major source of turbidity in the swell-influenced nearshore areas off the West Coast is the redistribution of fine inner shelf sediments by long-period Southern Ocean swells. The current velocities typical of the Benguela (10-30 cm/s) are capable of resuspending and transporting considerable quantities of sediment equator-wards. Under relatively calm wind conditions, however, much of the suspended fraction (silt and clay) that remains in suspension for longer periods becomes entrained in the slow poleward undercurrent (Shillington *et al.* 1990; Rogers & Bremner 1991).

Superimposed on the suspended fine fraction, is the northward littoral drift of coarser bedload sediments, parallel to the coastline. This northward, nearshore transport is generated by the predominantly south-westerly swell and wind-induced waves. Longshore sediment transport varies considerably in the shore-perpendicular

328

dimension, being substantially higher in the surf-zone than at depth, due to high turbulence and convective flows associated with breaking waves, which suspend and mobilise sediment (Smith & Mocke 2002).

On the inner and middle continental shelf, the ambient currents are insufficient to transport coarse sediments typical of those depths, and re-suspension and shoreward movement of these by wave-induced currents occur primarily under storm conditions (see also Drake *et al.* 1985; Ward 1985). Data from a Waverider buoy at Port Nolloth have indicated that 2-m waves are capable of re-suspending medium sands (200 µm diameter) at ~10 m depth, whilst 6-m waves achieve this at ~42 m depth. Low-amplitude, long-period waves will, however, penetrate even deeper. Most of the sediment shallower than 90 m can therefore be subject to re-suspension and transport by heavy swells (Lane & Carter 1999).

Offshore of the continental shelf, the oceanic waters are typically clear as they are beyond the influence of aeolian and riverine inputs. The waters in the Reconnaissance Permit Area are thus expected to be comparatively clear.

8.4 BIOLOGICAL ENVIRONMENT

This section provides a description of the biological characteristics of the application area. The information has been sourced from the Marine Ecological Study undertaken by Pisces Environmental Services (Pty) Ltd included in Appendix 3.

Biogeographically, the study area falls into the cold temperate Namaqua Bioregion, which extends from Sylvia Hill, north of Lüderitz in Namibia to Cape Columbine (Emanuel *et al.* 1992; Lombard *et al.* 2004). The Reconnaissance Permit Area falls into the Southeast Atlantic Deep Ocean Ecoregion (Sink *et al.* 2019) (Figure 16). The coastal, wind-induced upwelling characterising the western Cape coastline, is the principle physical process which shapes the marine ecology of the southern Benguela region. The Benguela system is characterised by the presence of cold surface water, high biological productivity, and highly variable physical, chemical and biological conditions.

The Southeast Atlantic Oceanic Ecoregion extends from the shelf edge of the Southern Benguela onto the slope and into the abyssal plain of the Cape Basin, which comprises a relatively monotonous plain, interrupted by sporadic seamounts. This deep ocean region extends into Namibia and is bounded in the north by the prominent Walvis Ridge. In the south it is separated from the Southwest Indian Deep Ocean by the Agulhas Ridge, a transverse ridge that forms part of the Agulhas Falklands Fracture Zone and acts as a divide between the Cape Basin and the Agulhas Basin. The biodiversity patterns in the deep ocean ecosystems are not well understood (Sink *et al.* 2019).

Communities within marine habitats are largely ubiquitous throughout the southern African West Coast region, being particular only to substrate type or depth zone. These biological communities consist of many hundreds of species, often displaying considerable temporal and spatial variability (even at small scales). The offshore marine ecosystems comprise a limited range of habitats, namely unconsolidated seabed sediments, deepwater reefs and the water column. The biological communities 'typical' of these habitats are described briefly below, focusing both on dominant, commercially important and conspicuous species, as well as potentially threatened or sensitive species, which may be affected by the proposed exploration activities.

8.4.1 DEMERSAL COMMUNITIES

8.4.1.1 BENTHIC INVERTEBRATE MACROFAUNA

The seabed communities in the Reconnaissance Permit Area lie within the Namaqua sub-photic and continental slope biozones, which extend from a 50 m depth to the shelf edge, and beyond to the lower deep-sea slope, respectively. The benthic habitats of South Africa were mapped as part of the 2018 National Biodiversity Assessment (Sink *et al.* 2019) to develop assessments of the ecosystem threat status and ecosystem protection level. The benthic ecosystem types were subsequently mapped (Figure 17) and assigned an ecosystem threat status based on their level of protection (Figure 18). The Reconnaissance Permit Area is characterised by a limited variety of ecosystem types covering the mid- and lower shelves, the Southeast Atlantic continental slope and the Cape Basin Abyss.

FC28

Figure 16: The Reconnaissance Permit Area (red polygon) in relation to the inshore and offshore ecoregions of the South African coast (adapted from Sink *et al.* 2019).

The benthic biota of unconsolidated marine sediments constitutes invertebrates that live on (epifauna) or burrow within (infauna) the sediments and are generally divided into macrofauna (animals >1 mm) and meiofauna (<1 mm). Numerous studies have been conducted on southern African West Coast continental shelf benthos, mostly focused on mining, pollution or demersal trawling impacts (Christie & Moldan 1977; Moldan 1978; Jackson & McGibbon 1991; Field *et al.* 1996; Field & Parkins 1997; Parkins & Field 1998; Pulfrich & Penney 1999; Goosen *et al.* 2000; Savage *et al.* 2001; Steffani & Pulfrich 2004; 2007; Steffani 2007a; 2007b; Atkinson 2009; Steffani 2009a, 2009b, 2010a, 2010b, 2010c; Atkinson *et al.* 2011; Steffani 2012a, 2012b, 2014; Karenyi 2014; Steffani *et al.* 2015; Biccard & Clark 2016; Biccard *et al.* 2016; Duna *et al.* 2016; Karenyi *et al.* 2016; Biccard *et al.* 2017, 2018; Gihwala *et al.* 2018; Biccard *et al.*2019; Gihwala *et al.* 2019). These studies, however, concentrated on the continental shelf and nearshore regions, and consequently the benthic fauna of the outer shelf and continental slope (beyond ~450 m depth) are very poorly known. This is primarily due to limited opportunities for sampling as well as the lack of access to Remote Operated Vehicles (ROVs) for visual sampling of hard substrata.

To date very few areas on the continental slope off the West Coast have been biologically surveyed (Sink *et al.* 2019; Harris *et al.* 2022). Although sediment distribution studies (Rogers & Bremner 1991) suggest that the outer shelf is characterised by unconsolidated sediments (see Figure 11), recent surveys conducted between 180 m and 480 m depth offshore of the Northern Cape coast revealed high proportions of hard ground rather than unconsolidated sediment, although this requires further verification (Karenyi unpublished data).

To date there have been no studies examining connectivity between slope, plateau or abyssal ecosystems in South Africa and there is thus limited knowledge on the benthic biodiversity of all three of these broad ecosystem groups in South African waters (Sink *et al.* 2019). There is no quantitative data describing bathyal ecosystems in South Africa and hence limited understanding of ecosystem functioning and sensitivity (Anderson & Hulley 2000; Harris *et al.* 2022). Due to the lack of information on benthic macrofaunal communities beyond the shelf break, no description can be provided for the offshore portions of the Reconnaissance Permit Area. However, as these communities would receive the sound in the far field only, no detrimental effects to the communities or to individual benthic species are expected. The description below for areas on the continental shelf, offshore of the Northern Cape coast is drawn from recent surveys by Karenyi (2014), Duna *et al.* (2016), Mostert *et al.* (2016), and Gihwala *et al.* (2018, 2019).

Three macro-infauna communities have been identified on the inner- (0-30 m depth) and mid-shelf (30-150 m depth, Karenyi *et al.* 2016). Polychaetes, crustaceans and molluscs make up the largest proportion of individuals, biomass and species on the west coast. The inner-shelf community, which is affected by wave action, is characterised by various mobile gastropod and polychaete predators and sedentary polychaetes and isopods. The mid-shelf community inhabits the mudbelt and is characterised by mud prawns. A second mid-shelf community occurring in sandy sediments, is characterised by various deposit-feeding polychaetes. The distribution of species within these communities are inherently patchy reflecting the high natural spatial and

temporal variability associated with macro-infauna of unconsolidated sediments (e.g. Kenny *et al.* 1998; Kendall & Widdicombe 1999; van Dalfsen *et al.* 2000; Zajac *et al.* 2000; Parry *et al.* 2003), with evidence of mass mortalities and substantial recruitments recorded on the South African West Coast (Steffani & Pulfrich 2004).

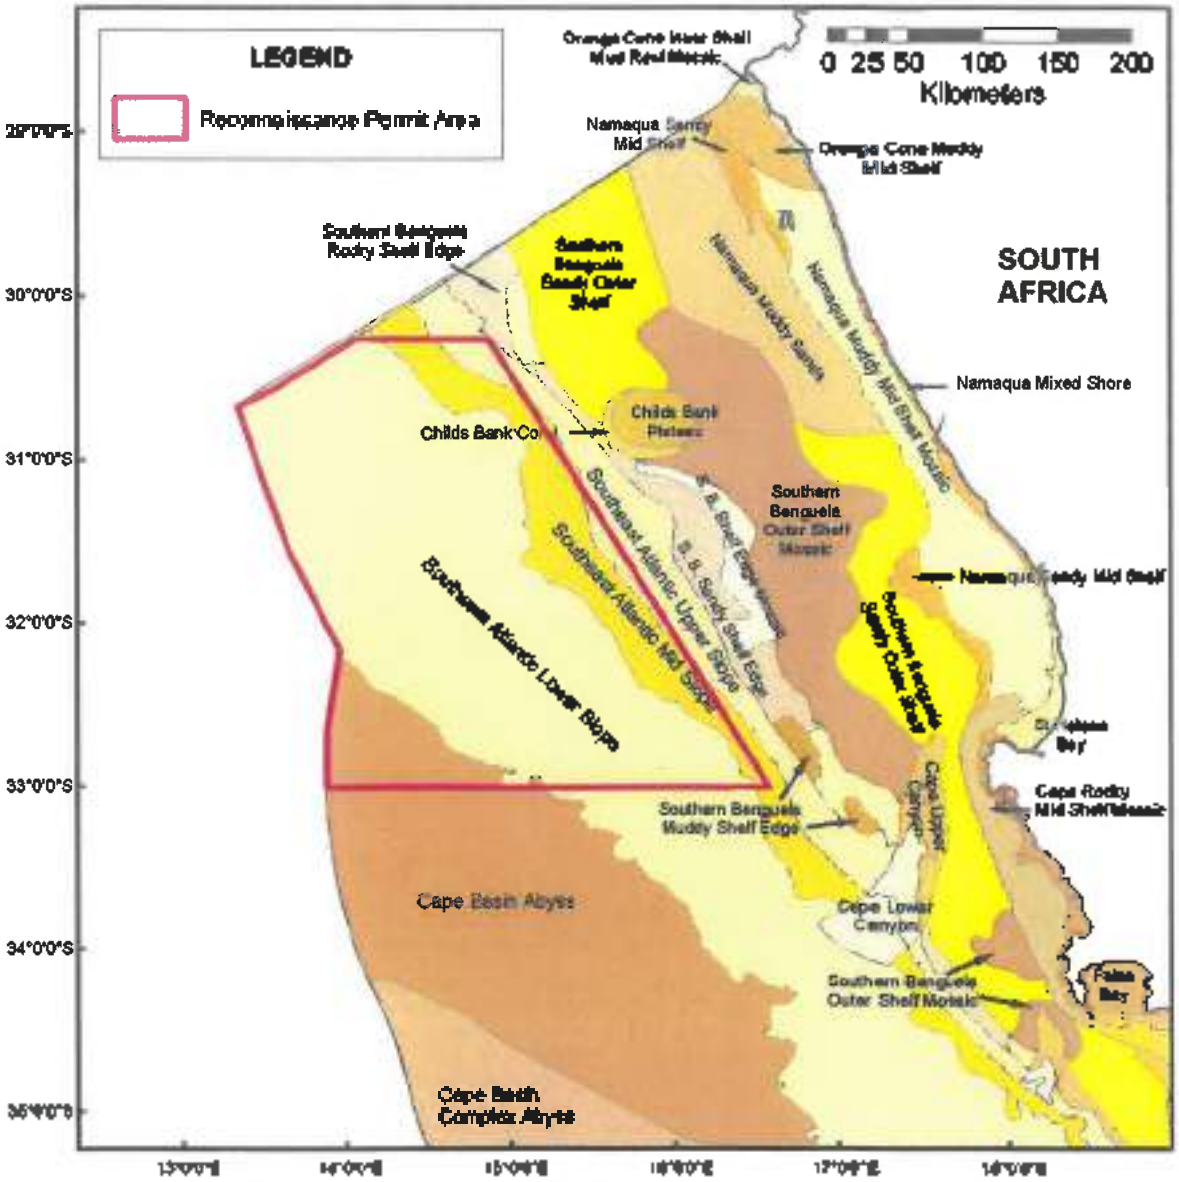

Figure 17: The Reconnaissance Permit Area (red polygon) in relation to the distribution of ecosystem types along the West Coast (adapted from Sink *et al.* 2019). Only those ecosystem types within the immediate vicinity of the Reconnaissance Permit Area are labelled.

Despite the current lack of knowledge of the community structure and endemicity of South African macro-infauna off the edge of the continental shelf, the marine component of the 2018 National Biodiversity Assessment (Sink *et al.* 2019), rated the South Atlantic bathyal and abyssal unconsolidated habitat types that characterise depths beyond 500 m, as being of 'Least concern' (Figure 18), with only those communities occurring along the shelf edge (~500 m) being considered 'Vulnerable'. This primarily reflects the great extent of these habitats in the South African Exclusive Economic Zone (EEZ).

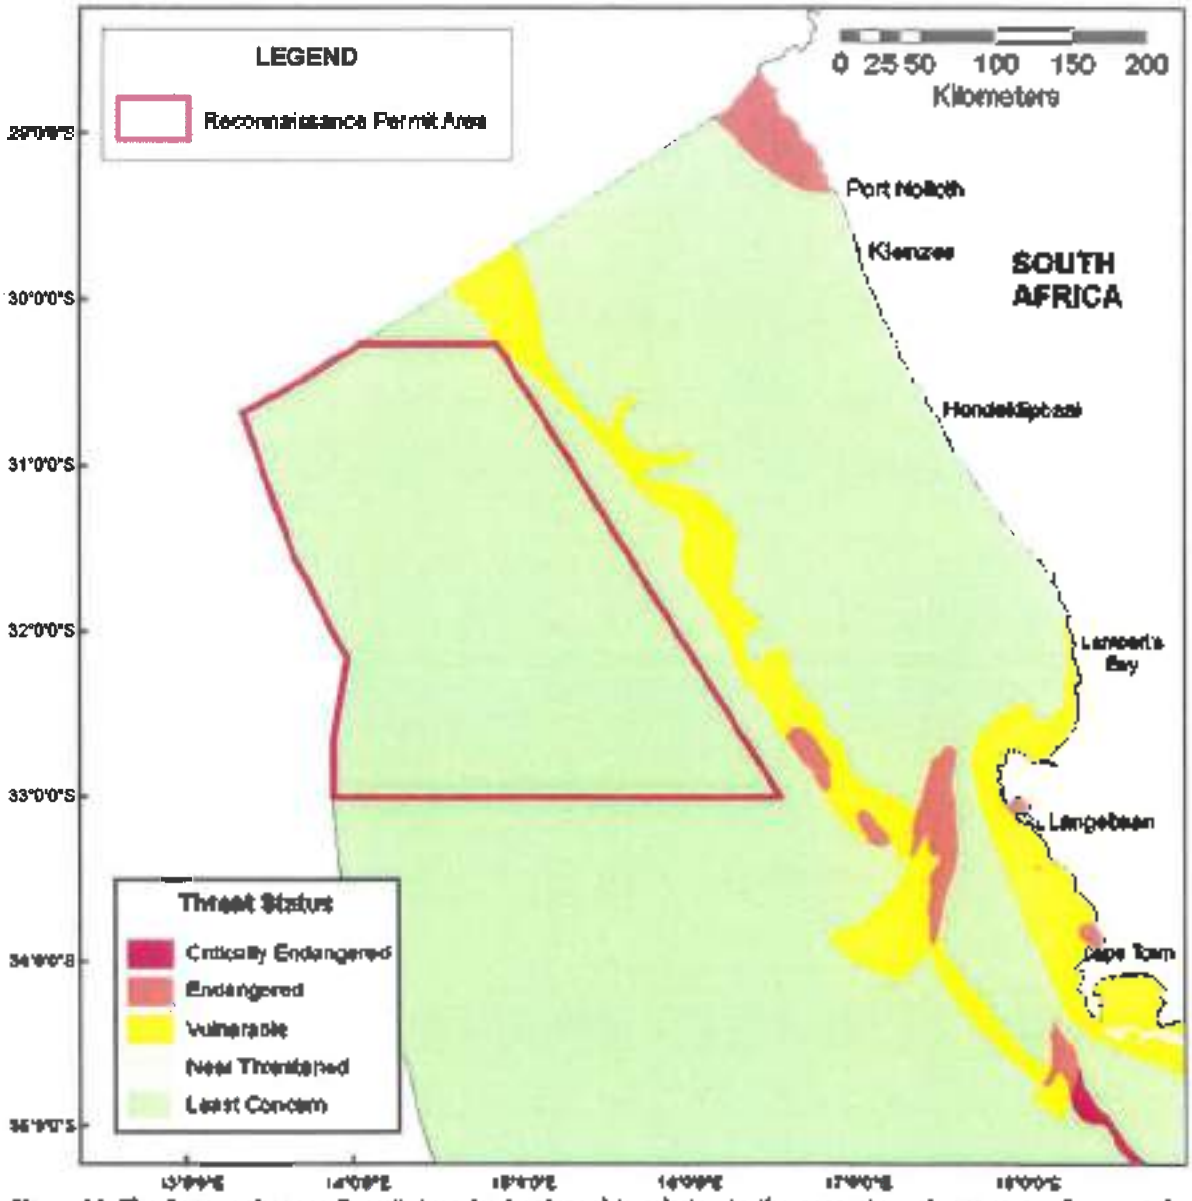

Figure 18: The Reconnaissance Permit Area (red polygon) in relation to the ecosystem threat status for coastal and offshore benthic and pelagic habitat types on the South African West Coast (adapted from Sink *et al.* 2019).

Karenyi *et al.* (2016) found that off Namaqualand, species richness generally increased from the inner-shelf across the mid-shelf and is influenced by sediment type. The highest total abundance and species diversity was measured in sandy sediments of the mid-shelf. Biomass is highest in the inshore (± 50 g/m^2 wet weight) and decreases across the mid-shelf averaging around 30 g/m^2 wet weight. This is contrary to Christie (1974) who found that biomass was greatest in the mudbelt at 80 m depth off Lamberts Bay, where the sediment characteristics and the impact of environmental stressors (such as low oxygen events) are likely to differ from those off the northern Namaqualand coast.

Benthic communities are structured by the complex interplay of a large array of environmental factors. Water depth and sediment grain size are considered the two major factors that determine benthic community structure and distribution on the South African west coast (Christie 1974, 1976; Steffani & Pulfrich 2004a, 2004b; 2007; Steffani 2007a; 2007b) and elsewhere in the world (e.g. Gray 1981; Ellingsen 2002; Bergen *et al.* 2001; Post *et al.* 2006). However, studies have shown that shear bed stress - a measure of the impact of current velocity on sediment – oxygen concentration (Post *et al.* 2006; Currie *et al.* 2009; Zettler *et al.* 2009, 2013), productivity (Escaravage *et al.* 2009), organic carbon and seafloor temperature (Day *et al.* 1971) may also strongly influence the structure of benthic communities. There are clearly other natural processes operating in the deep water shelf areas of the West Coast that can over-ride the suitability of sediments in determining benthic community

structure, and it is likely that periodic intrusion of low oxygen water masses is a major cause of this variability (Monteiro & van der Plas 2006; Pulfrich *et al.* 2006). In areas of frequent oxygen deficiency, benthic communities will be characterised either by species able to survive chronic low oxygen conditions, or colonising and fast-growing species able to rapidly recruit into areas that have suffered oxygen depletion. The combination of local, episodic hydrodynamic conditions and patchy settlement of larvae will tend to generate the observed small-scale variability in benthic community structure.

The invertebrate macrofauna are important in the marine benthic environment as they influence major ecological processes (e.g. remineralisation and flux of organic matter deposited on the sea floor, pollutant metabolism, sediment stability) and serve as important food source for commercially valuable fish species and other higher order consumers. As a result of their comparatively limited mobility and permanence over seasons, these animals provide an indication of historical environmental conditions and provide useful indices with which to measure environmental impacts (Gray 1974; Warwick 1993; Salas *et al.* 2006).

Also associated with soft-bottom substrates are demersal communities that comprise epifauna and bottom-dwelling vertebrate species, many of which are dependent on the invertebrate benthic macrofauna as a food source. According to Lange (2012) the continental shelf on the West Coast between depths of 100 m and 250 m, contained a single epifaunal community characterised by the hermit crabs *Sympagurus dimorphus* and *Parapagurfs pilosimanus*, the prawn *Funchalia woodwardi* and the sea urchin *Brissopsis capensis*. Atkinson (2009) also reported numerous species of urchins and burrowing anemones beyond 300 m depth off the West Coast.

Information on the benthic fauna of the lower continental slope and abyss (beyond 1 800 m depth) is largely lacking due to limited opportunities for sampling. However, deep water benthic sampling was undertaken (Benthic Solutions Ltd 2019) as part of the Environmental Baseline Survey for Total E&P Namibia's Block 2913B just to the north of the Reconnaissance Permit Area. This provided valuable information on the benthic infaunal communities of the lower continental slope. As conditions in such deep water habitats tend to be more uniform (low temperatures and low oxygen concentrations characterising the SACW that comprises the bulk of the water in the area), similar communities may be expected in the Reconnaissance Permit Area.

The macrofauna in Block 2913B were generally impoverished but fairly consistent, which is typical for deep water sediments. The 105 species recorded, were dominated by polychaetes, which accounted for 64.1% of the total individuals. Molluscs were represented by 11 species (19.6% of total individuals), whilst 10 species of crustaceans were recorded (contributing to only 9.8% of total individuals). Echinoderms were represented by only 3 species (5.8% of total individuals), whilst all other groups (Actiniaria, Nemertea, Nematoda, Asoidiacea and Priapulida) accounted for the remaining 5.9% of individuals. The deposit-feeding polychaete *Spiophanes sp.* was the most abundant species recorded. This small bristleworm can either be a passive suspension feeder or a surface deposit feeder, living off sediment particles, planktonic organisms and meiobenthic organisms. The bivalve mollusc *Microgloma mirmidina* was the second most common species, with the polychaete tentatively identified as a *Leiocapitellide* being the third most abundant. With the exception of the carnivorous polychaete *Glycera capitata*, most species were suspension or deposit feeders typical of soft unconsolidated sediments.

Examples of the macroinvertebrate infauna of the Block 2913B area are illustrated in Figure 19. A wide diversity of macroinvertebrates has been recorded inshore of the 1 000 m depth contour, and the reader is referred to the comprehensive field guide compiled by Atkinson & Sink (2018).

The 2018 National Biodiversity Assessment for the marine environment (Sink *et al.* 2019) points out that very few national IUCN Red List assessments have been conducted for marine invertebrate species to date owing to inadequate taxonomic knowledge, limited distribution data, a lack of systematic surveys and limited capacity to advance species red listing for these groups.

8.4.1.2 DEEP-WATER CORAL COMMUNITIES

There has been increasing interest in deep-water corals in recent years because of their likely sensitivity to disturbance and their long generation times. These benthic filter-feeders generally occur at depths in below 150 m with some species being recorded from as deep as 3 000 m. Some species form reefs while others are smaller and remain solitary. Corals add structural complexity to otherwise uniform seabed habitats thereby creating areas of high biological diversity (Breeze *et al.* 1997; Macissac *et al.* 2001). Deep water corals establish themselves below the thermocline where there is a continuous and regular supply of concentrated particulate organic matter, caused by the flow of a relatively strong current over special topographical formations which cause eddies to form. Nutrient seepage from the substratum might also promote a location for settlement (Hovland *et al.* 2002). In the productive Benguela region, substantial areas on and off the edge of the shelf should

thus potentially be capable of supporting rich, cold water, benthic, filter-feeding communities, and various species of scleractine and stylasterine corals have been reported from depths beyond -200 m in the Orange Basin.

Such communities would also be expected with topographic features such as seamounts located adjacent to the northern and western boundary of the Reconnaissance Permit Area (see Figure 9). Nonetheless, our understanding of the invertebrate fauna of the sub-photic zone is relatively poor (Gibbons *et al.* 1999) and the conservation status of the majority of invertebrates in this bioregion is not known.

8.4.1.3 DEMERSAL FISH SPECIES

Demersal fish are those species that live and feed on or near the seabed. As many as 110 species of bony and cartilaginous fish have been identified in the demersal communities on the continental shelf of the West Coast (Roel 1987). Details on demersal fish communities beyond the shelf break and in the Reconnaissance Permit Area are, however, lacking (see Harris *et al.* 2012). Changes in fish communities occur both latitudinally (Shine 2006, 2008; Yemane *et al.* 2015) and with increasing depth (Roel 1987; Smale *et al.* 1993; Macpherson & Gordon 1992; Bianchi *et al.* 2001; Atkinson 2009; Yemane *et al.* 2015), with the most substantial change in species composition occurring in the shelf break region between 300 m and 400 m depth (Roel 1987; Atkinson 2009). The shelf community (<380 m) is dominated by the Cape hake *M. capensis*, and includes jacopever (*Helicolenus dactylopterus*), kusk catshark (*Holohalaelurus regani*), soupfin shark (*Galeorhinus galeus*) and whitespotted houndshark (*Mustelus palumbes*). The more diverse deeper water community is dominated by the deepwater hake (*Merluccius paradoxus*), monkfish (*Lophius vomerinus*), kingklip (*Genypterus capensis*), bronze whiptail (*Lucigadus ori*) and hairy conger (*Bassanago albescens*) and various squalid shark species. There is some degree of species overlap between the depth zones.

Roel (1987) showed seasonal variations in the distribution ranges shelf communities, with species such as the pelagic goby (*Sufflogobius bibarbatus*), and West Coast sole (*Austroglossus microlepis*) occurring in shallow water north of Cape Point during summer only. The deep-sea community was found to be homogenous both spatially and temporally. In a more recent study, however, Atkinson (2009) identified two long-term community shifts in demersal fish communities; the first (early to mid-1990s) being associated with an overall increase in density of many species, whilst many species decreased in density during the second shift (mid-2000s). These community shifts correspond temporally with regime shifts detected in environmental forcing variables (Sea Surface Temperatures and upwelling anomalies) (Howard *et al.* 2007) and with the eastward shifts observed in small pelagic fish species and rock lobster populations (Coetzee *et al.* 2008, Cockcroft *et al.* 2008).

The diversity and distribution of demersal cartilaginous fishes on the West Coast is discussed by Compagno *et al.* (1991). The species that may occur in the general project area and on the continental shelf inshore thereof, and their approximate depth range, are listed in Table 7. Details on demersal cartilaginous species beyond the shelf break and in the Reconnaissance Permit Area are lacking, however.

There is limited information about bathyal fish communities in South Africa. South Africa defines its bathyal zone as extending from 500 m to 3 500 m, recognising an upper slope (500-1 000 m), mid slope (1 000-1 800 m) and lower slope (1 800-3 500 m). Typical upper slope fishes (200-2 000 m) include rattails (Macrouridae), greeneyes (*Chlorophthalmus* species), notacanthids, halosaurs, chimaeras, skates, bythitids such as *Cataetyx* spp. and moriids (deepsea cods) (Smith & Heemstra 2003). Rattails, bythitids, liparidids (snail fishes) and notacanthids (*Polyacanthonotus* species and halosaurs) are characteristic of the lower bathyal (see also Iwamoto & Anderson 1994; Jones 2014).

Spearnose chimaera	*Rhinochimaera atlantica*	650-960	LC

LC – Least Concern, VU – Vulnerable, NT – Near Threatened, EN – Endangered, CR – Critically Endangered, DD – Data Deficient

8.4.2 SEAMOUNT AND SUBMARINE CANYON COMMUNITIES

Features such as banks, knolls and seamounts (referred to collectively here as "seamounts"), which protrude into the water column, are subject to, and interact with, the water currents surrounding them. The effects of such seabed features on the surrounding water masses can include the up-welling of relatively cool, nutrient-rich water into nutrient-poor surface water thereby resulting in higher productivity (Clark *et al.* 1999), which can in turn strongly influences the distribution of organisms on and around seamounts. Evidence of enrichment of bottom-associated communities and high abundances of demersal fishes has been regularly reported over such seabed features.

The enhanced fluxes of detritus and plankton that develop in response to the complex current regimes lead to the development of detritivore-based food-webs, which in turn lead to the presence of seamount scavengers and predators. Seamounts provide an important habitat for commercial deepwater fish stocks such as orange roughy, oreos, alfonsino and Patagonian toothfish, which aggregate around these features for either spawning or feeding (Koslow 1996).

Such complex benthic ecosystems in turn enhance foraging opportunities for many other predators, serving as mid-ocean focal points for a variety of pelagic species with large ranges (turtles, tunas and billfish, pelagic sharks, cetaceans and pelagic seabirds) that may migrate large distances in search of food or may only congregate on seamounts at certain times (Hui 1985; Harley *et al.* 1995). Seamounts thus serve as feeding grounds, spawning and nursery grounds and possibly navigational markers for a large number of species (SPRFMA 2007; Derville *et al.* 2020).

Enhanced currents, steep slopes and volcanic rocky substrata, in combination with locally generated detritus, favour the development of suspension feeders in the benthic communities characterising seamounts (Rogers 1994). Deep- and cold-water corals (including stony corals, black corals and soft corals) are a prominent component of the suspension-feeding fauna of many seamounts, accompanied by barnacles, bryozoans, polychaetes, molluscs, sponges, sea squirts, basket stars, brittle stars and crinoids (reviewed in Rogers 2004). There is also associated mobile benthic fauna that includes echinoderms (sea urchins and sea cucumbers) and crustaceans (crabs and lobsters) (reviewed by Rogers 1994; Kenyon *et al.* 2003). Some of the smaller cnidarians species remain solitary while others form reefs thereby adding structural complexity to otherwise uniform seabed habitats.

Consequently, the fauna of seamounts is usually highly unique and may have a limited distribution restricted to a single geographic region, a seamount chain or even a single seamount location (Rogers *et al.* 2008). As a result of conservative life histories (i.e. very slow growing, slow to mature, high longevity, low fecundity and unpredictable recruitment) and sensitivity to changes in environmental conditions, such biological communities have been identified as Vulnerable Marine Ecosystems (VMEs). They are recognised as being particularly sensitive to anthropogenic disturbance (primarily deep-water trawl fisheries and mining), and once damaged are very slow to recover, or may never recover (FAO 2008).

Geological features of note within the broader project area are Child's Bank and Tripp Seamount, with an unnamed seamount located in ~3 500 m at ~32°20'S; 13°30'E, as well as the Cape Canyon and Cape Point Valley. Child's Bank, which is situated at about 31°S, was described by Dingle *et al.* (1987) to be a carbonate mound (bioherm). The top of this feature is a sandy plateau with dense aggregations of brittle stars, while the steeper slopes have dense invertebrate assemblages including unidentified cold-water corals/rugged limestone feature, bounded at outer edges by precipitous cliffs at least 150 m high (Birch & Rogers 1973). Composed of sediments and the calcareous deposits from an accumulation of carbonate skeletons of sessile organisms (e.g. cold-water coral, foraminifera or marl), such features typically have topographic relief, forming isolated seabed knolls in otherwise low profile homogenous seabed habitats (Kopaska-Merkel & Haywick 2001; Kenyon *et al.* 2003,

SLR

Wheeler *et al.* 2005, Colman *et al.* 2005). Tripp Seamount situated at about 29°40'S, lies ~30 km north of the northern boundary of the Application Area. It rises from the seabed at ~1 000 m to a depth of 150 m and roughly circular with a flat apex that drops steeply on all sides. There is reference to decapods crustaceans from Tripp Seamount (Kensley 1980, 1981) and exploratory deepwater trawl fishing (Hampton 2003), but otherwise knowledge of benthic communities characterising this seamount is lacking.

The Cape Rise comprises a group of NE-SW trending seamounts – the Southeast Atlantic Seamounts - which include Argentina and Protea Seamounts and the recently discovered Mount Marek. These rise up from over ~2 500 m depth in the Cape Basin abyss to 700 m deep. Other than a geoscience survey conducted in 1986 using a deep water camera to sample the lower bathyal and abyssal zones, including the seamount flanks, of the Cape Basin (Rogers 1986) no biodiversity surveys are known to have been conducted at Protea and Argentina seamounts. Southern Africa's seamounts and their associated benthic communities have not been sampled by either geologists or biologists (Sink & Samaai, 2009) and little is known about the benthic and neritic communities associated with them.

A recent study reporting on the megabenthos and benthopelagic fish on the Southeast Atlantic Seamounts (Bergstad *et al.* 2019), provides descriptions of the Erica and Schmitt-Ott Seamounts that lie approximately 450 – 500 km southwest of the Argentina Seamount and rise from the surrounding abyss to depths of 770 m and 920 m, respectively. Corals were the most frequent and widespread sessile invertebrate recorded on video transects, dominated by gorgonians whose abundance increased towards the seamount summits. Scleractinian and hydrocorals were also observed as was a diversity of sponges, echinoderms and crustaceans. Fish associated with the seamount included oreo dories, grenadiers and lanternshark. Similar communities might therefore be expected from the Protea and Argentina Seamounts.

During 2016-2018 the Department of Environmental Affairs: Oceans and Coast Branch (DEA: O&C) undertook research cruises to explore some of the undocumented areas of seabed off the West Coast, among them the Cape Canyon. Using tow-cameras, benthic grabs and dredges, the biota of the canyon head to ~500 m depth were sampled (Figure 20). A diversity of echinoderms, molluscs, and crustaceans were reported to dominate the canyon head, while scavengers such as ophuiroides and decapods were prevalent within habitats ranging from sandy areas, to patches of inshore and offshore mud belts. At depths of <100 m inshore of the canyon head, boulder beds hosted gorgonian and stylasterine corals.

The concept of a 'Vulnerable Marine Ecosystem' (VME) centres upon the presence of distinct, diverse benthic assemblages that are limited and fragmented in their spatial extent, and dominated (in terms of biomass and/or spatial cover) by rare, endangered or endemic component species that are physically fragile and vulnerable to damage (or structural/biological alteration) by human activities (Parker *et al.* 2009; Auster *et al.* 2011; Hansen *et al.* 2013).

VMEs are known to be associated with higher biodiversity levels and indicator species that add structural complexity, resulting in greater species abundance, richness, biomass and diversity compared to surrounding uniform seabed habitats (Buhl-Mortensen *et al.* 2010; Hogg *et al.* 2010; Barrio Froján *et al.* 2012; Beazley *et al.* 2013, 2015). Compared to the surrounding deep-sea environment, VMEs typically form biological hotspots with a distinct, abundant and diverse fauna, many species of which remain unidentified. Levels of endemism on VMEs are also relatively high compared to the deep sea. The coral frameworks offer refugia for a great variety of invertebrates and fish (including commercially important species) within, or in association with, the living and dead coral framework thereby creating spatially fragmented areas of high biological diversity. The skeletal remains of Scleractinia coral rubble and Hexactinellid poriferans can also represent another important deep-sea habitat, acting to stabilise seafloor sediments allowing for colonisation by distinct infaunal taxa that show elevated abundance and biomass in such localised habitats (Bett & Rice 1992; Faws & Vanreusel 2005; Beazley *et al.* 2013; Ashford *et al.* 2019).

VMEs are also thought to contribute toward the long-term viability of a stock through providing an important source of habitat for commercial species (Pham *et al.* 2015; Ashford *et al.* 2019). They can provide a wide range of ecosystem services ranging from provision of aggregation- and spawning sites to providing shelter from predation and adverse hydrological conditions (Husebø & Nøttestad *et al.* 2002; Krieger & Wing, 2002; Tissot *et al.*, 2006; Baillon *et al.* 2012; Pham *et al.* 2015). Indicator taxa for VMEs are also known to provide increased access to food sources, both directly to associated benthic fauna, and indirectly to other pelagic species such as fish and other predators due to the high abundance and biomass of associated fauna (Krieger & Wing, 2002; Husebø & Nøttestad *et al.* 2002; Buhl-Mortensen *et al.*, 2010; Hogg *et al.*, 2010; Auster *et al.* 2011).

5128

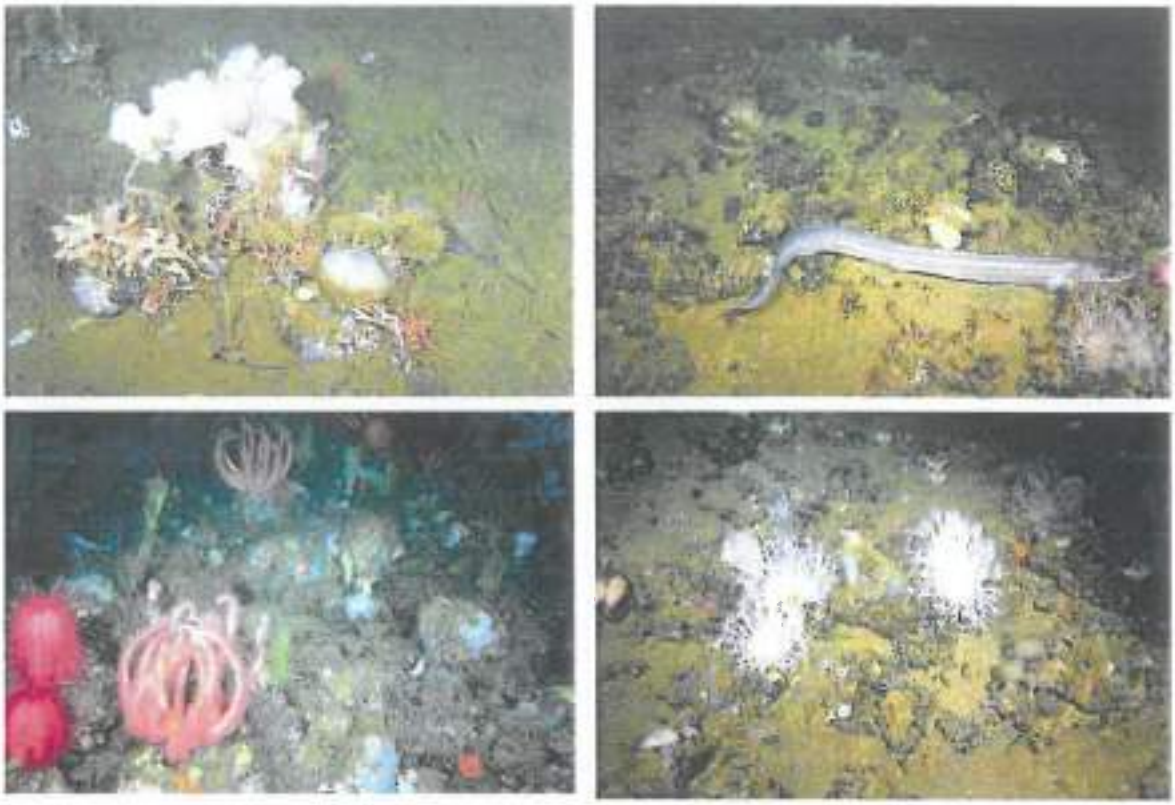

Figure 20: Deep water benthic macrofauna from various depths in the Cape Canyon (Source: www.environment.gov.za/dearesearchteamreturnfromdeepseaexpedition).

VME frameworks are typically elevated from the seabed, increasing turbulence and raising supply of suspended particles to suspension feeders (Krieger & Wing 2002; Buhl-Mortensen & Mortensen 2005; Buhl-Mortensen *et al.* 2010). Porifierans and cold-water corals have further been shown to provide a strong link between pelagic and benthic food webs (Pile & Young 2006; Cathalot *et al.* 2015). VMEs are increasingly being recognised as providers of important ecosystem services due to associated increased biodiversity and levels of ecosystem functioning (Ashford *et al.* 2019).

It is not always the case that seamount habitats are VMEs, as some seamounts may not host communities of fragile animals or be associated with high levels of endemism. Evidence from video footage taken on hard-substrate habitats in 100 - 120 m depth off southern Namibia and to the south-east of Child's Bank (De Beers Marine, unpublished data) (Figure 21), and in 190-527 m depth on Child's Bank (Sink *et al.* 2019) suggest that vulnerable communities including gorgonians, octocorals and reef-building sponges and hard-corals do occur on the continental shelf, some of which are thought to be Vulnerable Marine Ecosystem (VME) indicator species (Table 8). The distribution of 22 potential VME indicator taxa for the South African EEZ was recently mapped, with those from the West Coast listed in Table 8 (Atkinson & Sink 2018; Sink *et al.* 2019).

As sampling beyond 1 000 m depth has not taken place (Atkinson & Sink 2018) it is not known whether similar communities may be expected in the Reconnaissance Permit Area. Should they occur, however, they would receive the sound in the far field only and no detrimental effects to the communities or to individual benthic species are expected. The distribution of known and potential Vulnerable Marine Ecosystem habitat based on potential VME features, DFFE and SAEON trawl survey data, and many visual surveys indicating the presence of indicator taxa were mapped by Harris *et al.* 2022 (Figure 22). Some sites need more research to determine their status. The location of the Reconnaissance Permit Area is well offshore of these known and potential VMEs emphasising the gaps in our knowledge specific to the vulnerability of marine communities of abyssal habitats.

SL29

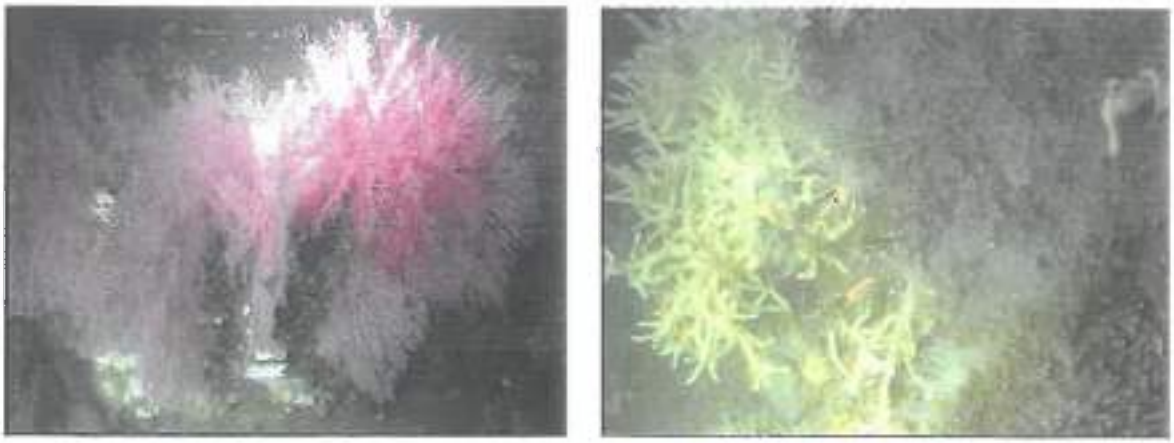

Figure 21: Gorgonians and bryozoans communities recorded on deep-water reefs (100-120 m) off the southern African West Coast (Photos: De Beers Marine).

Table 8: Table of Potential VME species from the continental shelf and shelf edge on the West Coast (Atkinson & Sink 2018)

Phylum	Name	Common Name
Porifera	*Suberites dendelenae*	Amorphous solid sponge
	Rossella cf. antarctica	Glass sponge
Cnidaria	*Melithaea* spp.	Colourful sea fan
	Thouarella spp.	Bottlebrush sea fan
Family: Isididae	?	Bamboo coral
	Anthoptilum grandiflorum	Large sea pen*
	Lophelia pertusa	Reef-building cold water coral
	Stylaster spp.	Fine-branching hydrocoral
Bryozoa	*Adeonella* spp.	Sabre bryozoan
	Phidoloporidae spp.	Honeycomb false lace coral
Hemichordata	*Cephalodiscus gilchristi*	Acorn animal

Sediment samples collected at the base of Norwegian cold-water coral reefs revealed high interstitial concentrations of light hydrocarbons (methane, propane, ethane and higher hydrocarbons C4+) (Hovland & Thomsen 1997), which are typically considered indicative of localised light hydrocarbon micro-seepage through the seabed. Bacteria and other micro-organisms thrive on such hydrocarbon pore-water seepages, thereby providing suspension-feeders, including corals and gorgonians, with a substantial nutrient source. Some scientists believe there is a strong correlation between the occurrence of deep-water coral reefs and the relatively high values of light hydrocarbons (methane, ethane, propane and n-butane) in near-surface sediments (Hovland *et al.* 1998, Duncan & Roberts 2001, Hall-Spencer *et al.* 2002, Roberts & Gage 2003). A recent study by January (2018) identified that hydrocarbon seeps and gas escape structures have been identified in the Orange Basin area. Large fluid seep/pockmark fields of varying morphologies were also reported to the south of the Reconnaissance Permit Area by Palan (2017).

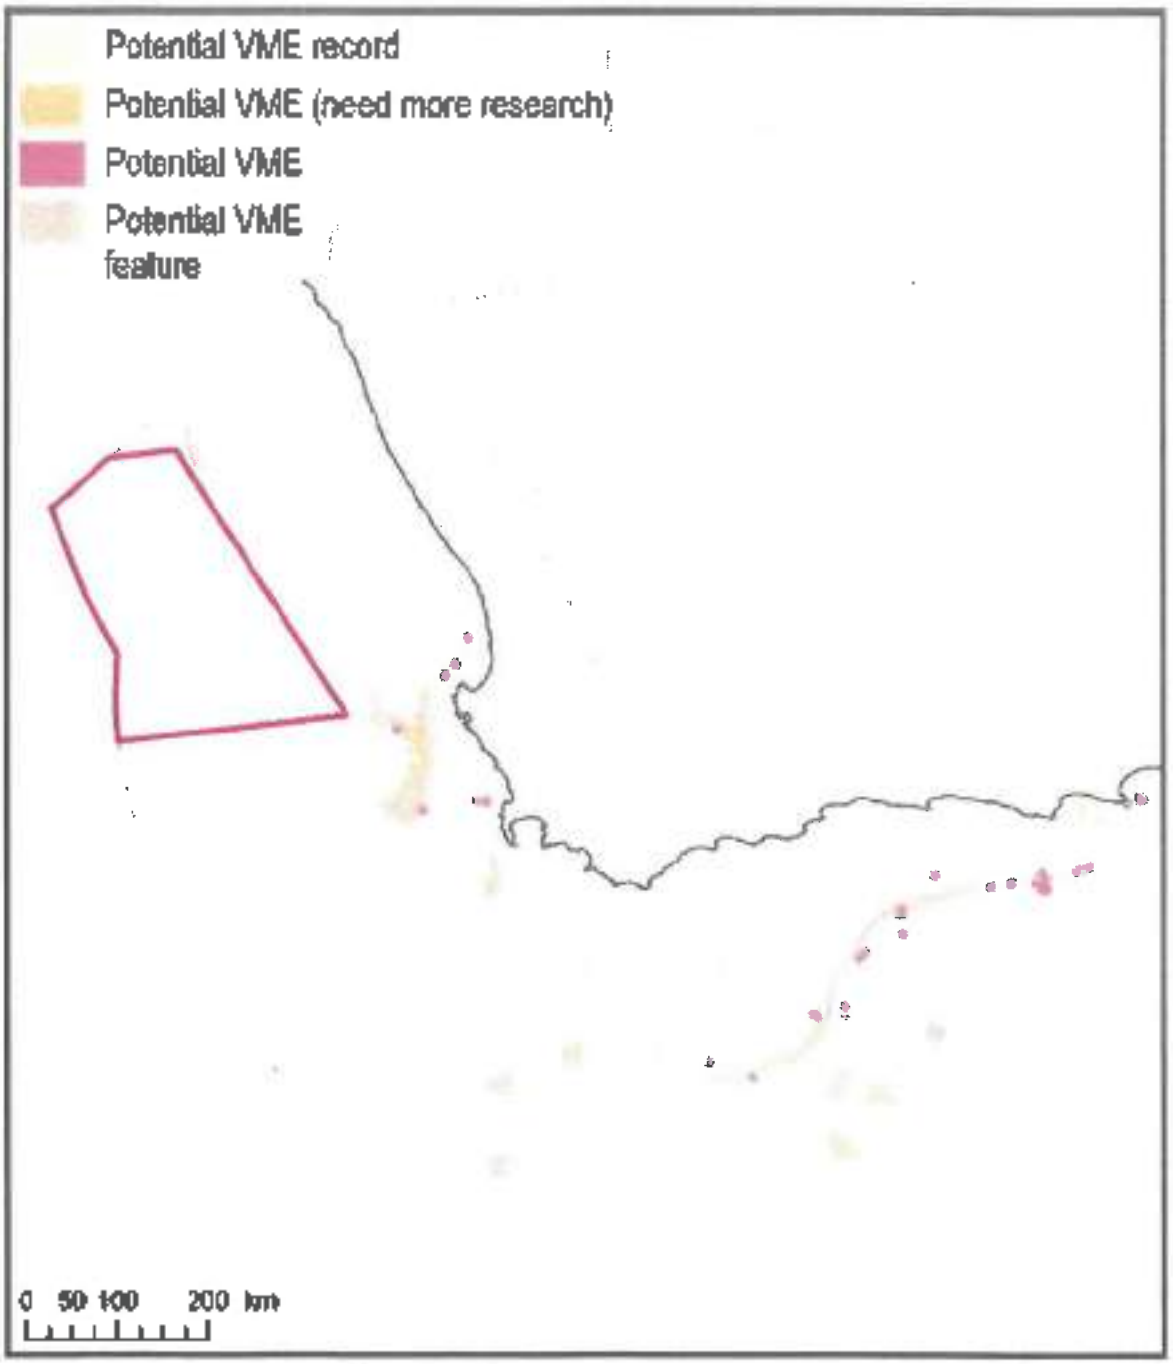

Figure 22: The Reconnaissance Permit Area (red polygon) in relation to the distribution of known and potential Vulnerable Marine Ecosystem habitat (adapted from Harris *et al.* 2022).

8.4.3 PELAGIC COMMUNITIES

In contrast to demersal and benthic biota associated with the seabed, pelagic species live and feed in the open water column. The pelagic communities are typically divided into plankton and fish, and their main predators, marine mammals (seals, dolphins and whales), seabirds and turtles. These are discussed separately below.

8.4.3.1 PLANKTON

Plankton is particularly abundant in the shelf waters off the West Coast, being associated with the upwelling characteristic of the area. Plankton range from single-celled bacteria to jellyfish of 2-m diameter, and include bacterio-plankton, phytoplankton, zooplankton, and ichthyoplankton (Figure 23).

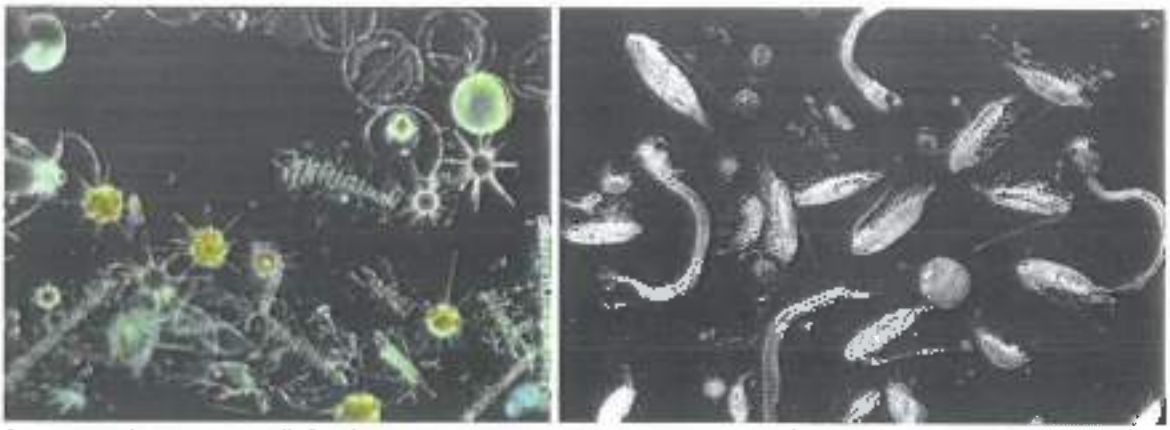

Figure 23: Phytoplankton (left, photo: hymagazine.com) and zooplankton (right, photo: mysciencebox.org) is associated with upwelling cells.

Phytoplankton are the principle primary producers with mean productivity ranging from 2.5 - 3.5 g C/m²/day for the midshelf region and decreasing to 1 g C/m²/day inshore of 130 m (Shannon & Field 1985; Mitchell-Innes & Walker 1991; Walker & Peterson 1991). The phytoplankton is dominated by large-celled organisms, which are adapted to the turbulent sea conditions. The most common diatom genera are *Chaetoceros*, *Nitzschia*, *Thalassiosira*, *Skeletonema*, *Rhizosolenia*, *Coscinodiscus* and *Asterionella* (Shannon & Pillar 1985). Diatom blooms occur after upwelling events, whereas dinoflagellates (e.g. *Prorocentrum*, *Ceratium* and *Peridinium*) are more common in blooms that occur during quiescent periods, since they can grow rapidly at low nutrient concentrations. In the surf zone, diatoms and dinoflagellates are nearly equally important members of the phytoplankton, and some silicoflagellates are also present.

Red-tides are ubiquitous features of the Benguela system (see Shannon & Pillar, 1986). The most common species associated with red tides (dinoflagellate and/or ciliate blooms) are *Noctiluca scintillans*, *Gonyaulax catenorensis*, *G. polygramma* and the ciliate *Mesodinium rubrum*. *Gonyaulax* and *Mesodinium* have been linked with toxic red tides. Most of these red-tide events occur quite close inshore although Hutchings *et al.* (1985) have recorded red-tides 30 km offshore. They are unlikely to occur in the offshore regions of the Application Area.

The mesozooplankton (≥200 µm) is dominated by copepods, which are overall the most dominant and diverse group in southern African zooplankton. Important species are *Centropages brachiatus*, *Calanoides carinatus*, *Metridia lucens*, *Nannocalanus minor*, *Clausocalanus arcuicornis*, *Paracalanus parvus*, *P. crassirostris* and *Ctenocalanus vanus*. All of the above species typically occur in the phytoplankton rich upper mixed layer of the water column, with the exception of *M. lucens* which undertakes considerable vertical migration.

The macrozooplankton (≥1 600 µm) are dominated by euphausiids of which 18 species occur in the area. The dominant species occurring in the nearshore are *Euphausia lucens* and *Nyctiphanes capensis*, although neither species appears to survive well in waters seaward of oceanic fronts over the continental shelf (Pillar *et al.* 1991).

Standing stock estimates of mesozooplankton for the southern Benguela area range from 0.2 - 2.0 g C/m², with maximum values recorded during upwelling periods. Macrozooplankton biomass ranges from 0.1-1.0 g C/m², with production increasing north of Cape Columbine (Pillar 1986). Although it shows no appreciable onshore-offshore gradients, standing stock is highest over the shelf, with accumulation of some mobile zooplanktors (euphausiids) known to occur at oceanographic fronts. Beyond the continental slope biomass decreases markedly. Localised peaks in biomass may, however, occur in the vicinity of Child's Bank and Tripp Seamount in response to topographically steered upwelling around such seabed features.

Zooplankton biomass varies with phytoplankton abundance and, accordingly, seasonal minima will exist during non-upwelling periods when primary production is lower (Brown 1984; Brown & Henry 1985), and during winter when predation by recruiting anchovy is high. More intense variation will occur in relation to the upwelling cycle; newly upwelled water supporting low zooplankton biomass due to paucity of food, whilst high biomasses develop in aged upwelled water subsequent to significant development of phytoplankton. Irregular pulsing of the upwelling system, combined with seasonal recruitment of pelagic fish species into West Coast shelf waters during winter, thus results in a highly variable and dynamic balance between plankton replenishment and food availability for pelagic fish species.

Although ichthyoplankton (fish eggs and larvae) comprise a minor component of the overall plankton, it remains significant due to the commercial importance of the overall fishery in the region. Various pelagic and demersal fish species are known to spawn in the inshore regions of the southern benguela, (including pilchard, round herring, chub mackerel lanternfish and hakes (Crawford *et al.* 1987; Hutchings 1994; Hutchings *et al.* 2002) (see Figure 24, Figure 25, Figure 26, and Figure 27), and their eggs and larvae form an important contribution to the ichthyoplankton in the region. Spawning of key species is presented below.

- Hake, snoek and round herring move to the western Agulhas Bank and southern west coast to spawn in late winter and early spring (key period), when offshore Ekman losses are at a minimum and their eggs and larvae drift northwards and inshore to the west coast nursery grounds. Figure 25 and Figure 26 highlight the temporal variation in hake eggs and larvae with there being a greater concentration of eggs and larvae between September - October compared to March - April. However, hake are reported to spawn throughout the year (Stramma *et al.* 2015). Snoek spawn along the shelf break (150-400 m) of the western Agulhas Bank and the West Coast between June and October (Griffiths 2002).
- Horse mackerel spawn over the east/central Agulhas Bank during winter months.
- Sardines spawn on the whole Agulhas Bank during November, but generally have two spawning peaks, in early spring and autumn, on either side of the peak anchovy spawning period (Figure 27, left). There is also sardine spawning on the east coast and even off KwaZulu-Natal, where sardine eggs are found during July–November.
- Anchovies spawn on the whole Agulhas Bank (Figure 27, right), with spawning peaking during mid-summer (November–December) and some shifts to the west coast in years when Agulhas Bank water intrudes strongly north of Cape Point.

The eggs and larvae are carried around Cape Point and up the coast in northward flowing surface waters. At the start of winter every year, the juveniles recruit in large numbers into coastal waters across broad stretches of the shelf between the Orange River and Cape Columbine to utilise the shallow shelf region as nursery grounds before gradually moving southwards in the inshore southerly flowing surface current, towards the major spawning grounds east of Cape Point. Following spawning, the eggs and larvae of snoek are transported to inshore (<150 m) nursery grounds north of Cape Columbine and east of Danger Point, where the juveniles remain until maturity. There is no overlap of the Reconnaissance Permit Area or indicative 3D acquisition area with the northward egg and larval drift of commercially important species, and the return migration of recruits (Figure 24). In the offshore oceanic waters of the Application Area, ichthyoplankton abundance is, therefore, expected to be low.

8.4.3.2 CEPHALOPODS

Fourteen species of cephalopods have been recorded in the southern Benguela, the majority of which are sepioids/cuttlefish (Lipinski 1992; Augustyn *et al.* 1995). Most of the cephalopod resource is distributed on the mid-shelf with *Sepia australis* being most abundant at depths between 60-190 m, whereas *S. hierredda* densities were higher at depths between 110-250 m. *Rossia enigmatica* occurs most commonly on the edge of the shelf to depths of 500 m. Biomass of these species was generally higher in the summer than in winter.

Cuttlefish are largely epi-benthic and occur on mud and fine sediments in association with their major prey item; mantis shrimps (Augustyn *et al.* 1995). They form an important food item for demersal fish.

The colossal squid *Mesonychoteuthis hamiltoni* and the giant squid *Architeuthis* sp. may also be encountered in the project area. Both are deep dwelling species, with the colossal squid's distribution confined to the entire circum-Antarctic Southern Ocean (Figure 28, top) while the giant squid is usually found near continental and island slopes all around the world's oceans (Figure 28, bottom). Both species could thus potentially occur in the pelagic habitats of the project area, although the likelihood of encounter is extremely low.

Growing to in excess of 10 m in length, they are the principal prey of the sperm whale, and are also taken by beaked whales, pilot whales, elephant seals and sleeper sharks. Nothing is known of their vertical distribution, but data from trawled specimens and sperm whale diving behaviour suggest they may span a depth range of

5628

300 – 1 000 m. They lack gas-filled swim bladders and maintain neutral buoyancy through an ammonium chloride solution occurring throughout their bodies.

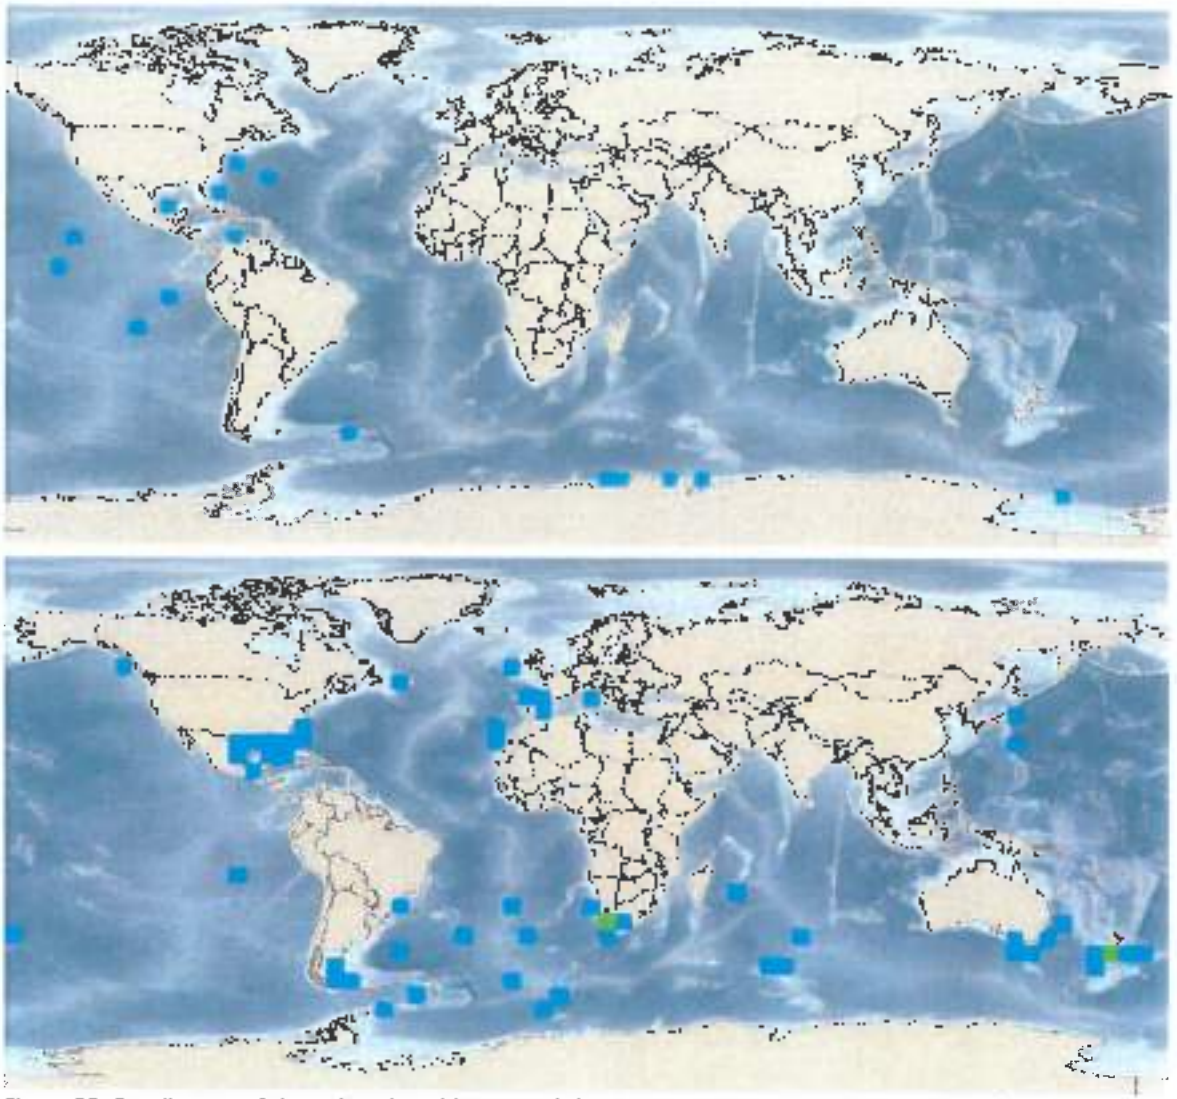

Figure 28: Distribution of the colossal squid (top) and the giant squid (bottom). Blue squares <5 records, green squares 5-10 records (Source: http://iobis.org).

8.4.3.3 PELAGIC FISH

Small pelagic species include the sardine/pilchard (*Sadinops ocellatus*) (Figure 29, left), anchovy (*Engraulis capensis*), chub mackerel (*Scomber japonicus*), horse mackerel (*Trachurus capensis*) (Figure 29, right) and round herring (*Etrumeus whiteheadi*). These species typically occur in mixed shoals of various sizes (Crawford et al. 1987), and generally occur within the 200 m contour and thus likely to only be encountered in southeastern inshore portion of the project area. Most of the pelagic species exhibit similar life history patterns involving seasonal migrations between the west and south coasts. The spawning areas of the major pelagic species are distributed on the continental shelf and along the shelf edge extending from south of St Helena Bay to Mossel Bay on the South Coast (Shannon & Pillar 1986) (see Figure 24). They spawn downstream of major upwelling centres in spring and summer, and their eggs and larvae are subsequently carried around Cape Point and up the coast in northward flowing surface waters.

At the start of winter every year, juveniles of most small pelagic shoaling species recruit into coastal waters in large numbers between the Orange River and Cape Columbine. They recruit in the pelagic stage, across broad stretches of the shelf, to utilise the shallow shelf region as nursery grounds before gradually moving southwards in the inshore southerly flowing surface current, towards the major spawning grounds east of Cape Point. Recruitment success relies on the interaction of oceanographic events, and is thus subject to spatial and

temporal variability. Consequently, the abundance of adults and juveniles of these small, short-lived (1-3 years) pelagic fish is highly variable both within and between species.

Figure 29: Cape fur seal preying on a shoal of pilchards (left). School of horse mackerel (right) (photos: www.underwatervideo.co.za; www.delivery.superstock.com).

Two species that migrate along the West Coast following the shoals of anchovy and pilchards are snoek *Thyrsites atun* and chub mackerel *Scomber japonicus*. Both these species have been rated as 'Least concern' on the national assessment (Sink *et al.* 2019). While the appearance of chub mackerel along the West and South-West coasts is highly seasonal, adult snoek are found throughout their distribution range and longshore movement are random and without a seasonal basis (Griffiths 2002). Initially postulated to be a single stock that undergoes a seasonal longshore migration from southern Angola through Namibia to the South African West Coast (Crawford & De Villiers 1985; Crawford *et al.* 1987), Benguela snoek are now recognised as two separate sub-populations separated by the Lüderitz upwelling cell (Griffiths 2009). On the West Coast, snoek move offshore to spawn and there is some southward dispersion as the spawning season progresses, with females on the West Coast moving inshore to feed between spawning events as spawning progresses. In contrast, those found further south along the western Agulhas Bank remain on the spawning grounds throughout the spawning season (Griffiths 2002) (Figure 30). They are voracious predators occurring throughout the water column, feeding on both demersal and pelagic invertebrates and fish. Chub mackerel similarly migrate along the southern African West Coast reaching South-Western Cape waters between April and August. They move inshore in June and July to spawn before starting the return northwards offshore migration later in the year. Their abundance and seasonal migrations are thought to be related to the availability of their shoaling prey species (Payne & Crawford 1989). The distribution of snoek and chub mackerel therefore lies well inshore of the Reconnaissance Permit Area.

The fish most likely to be encountered on the shelf, beyond the shelf break and in the offshore waters of the Application Areas are the large migratory pelagic species, including various tunas, billfish and sharks, many of which are considered threatened by the International Union for the Conservation of Nature (IUCN), primarily due to overfishing (Table 9). Tuna and swordfish are targeted by high seas fishing fleets and illegal overfishing has severely damaged the stocks of many of these species. Similarly, pelagic sharks, are either caught as bycatch in the pelagic tuna longline fisheries, or are specifically targeted for their fins, where the fins are removed and the remainder of the body discarded.

These large pelagic species migrate throughout the southern oceans, between surface and deep waters (>300 m) and have a highly seasonal abundance in the Benguela. Species occurring off western southern Africa include the albacore/longfin tuna *Thunnus alalunga* (Figure 31, right), yellowfin *T. albacores*, bigeye *T. obesus*, and skipjack *Katsuwonus pelamis tunas*, as well as the Atlantic blue marlin *Makaira nigricans* (Figure 31, left), the white marlin *Tetrapturus albidus* and the broadbill swordfish *Xiphias gladius* (Payne & Crawford 1989). The distribution of these species is dependent on food availability in the mixed boundary layer between the Benguela and warm central Atlantic waters. Concentrations of large pelagic species are also known to occur associated with underwater feature such as canyons and seamounts as well as meteorologically induced oceanic fronts (Shannon *et al.* 1989; Penney *et al.* 1992). Seasonal association with Child's Bank and Tripp Seamount occurs between October and June, with commercial catches often peaking in March and April (www.fao.org/fi/fcp/en/NAM/body.htm; see CapMarine 2022 – Fisheries Specialist Study in Appendix 3).

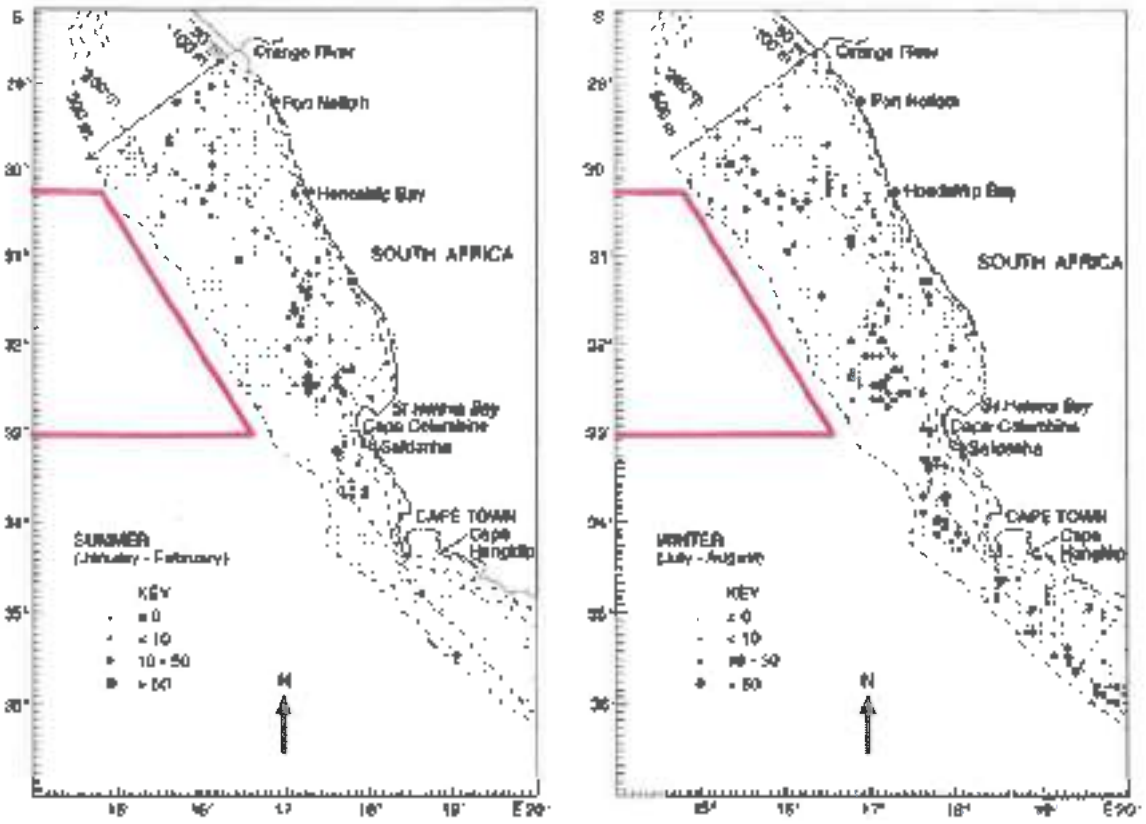

Figure 30: Mean number of snoek per demersal trawl per grid block (5 x 5 Nm) by season for (A) the west coast (July 1985–Jan 1991) and (B) the south coast in relation to the Reconnaissance Permit Area (red polygon) (adapted from Griffiths 2002).

Table 9: Some of the more important large migratory pelagic fish likely to occur in the offshore regions of the West Coast (TOPS list under NEMBA, Act 10 of 2004; Sink *et al.* 2019; www.iucnredlist.org;). The National and Global IUCN Conservation Status are also provided.

Longfin Mako	*Isurus paucus*	Not Assessed	Vulnerable
Whale Shark	*Rhincodon typus*	Not Assessed	Endangered
Blue Shark	*Prionace glauca*	Least concern	Near Threatened

A number of species of pelagic sharks are also known to occur on the West and South-West Coast, including blue *Prionace glauca*, short-fin mako *Isurus oxyrinchus* and oceanic whitetip sharks *Carcharhinus longimanus*. Occurring throughout the world in warm temperate waters, these species are usually found further offshore on the West Coast. Great whites *Carcharodon carcharias* and whale sharks *Rhincodon typus* may also be encountered in coastal and offshore areas, although the latter occurs more frequently along the South and East coasts. The recapture of a juvenile blue shark off Uruguay, which had been tagged off the Cape of Good Hope, supports the hypothesis of a single blue shark stock in the South Atlantic (Hazin 2000; Montealegre-Quijano & Vooren 2010) and Indian Oceans (da Silva *et al.* 2010). Using the Benguela drift in a north-westerly direction, it is likely that juveniles from the parturition off the south-western Cape would migrate through the project area *en route* to South America (da Silva *et al.* 2010).

The shortfin mako inhabits offshore temperate and tropical seas worldwide. It can be found from the surface to depths of 500 m, and as one of the few endothermic sharks is seldom found in waters <16 °C (Compagno 2001; Loefer *et al.* 2005). As the fastest species of shark, shortfin makos have been recorded to reach speeds of 40 km/h with burst of up to 74 km/h, and can jump to a height of 9 m (http://www.elasmo-research.org/education/shark_profiles/I_oxyrinchus.htm). Most makos caught by longliners off South Africa are immature, with reports of juveniles and sub-adults sharks occurring near the edge of the Agulhas Bank and off the South Coast between June and November (Groeneveld *et al.* 2014), whereas larger and reproductively mature sharks were more common in the inshore environment along the East Coast (Foulis 2013).

5028

Figure 31: Large migratory pelagic fish such as blue marlin (left) and longfin tuna (right) occur in offshore waters (photos: www.samathatours.com; www.osfimages.com).

Whale sharks are regarded as a broad ranging species typically occurring in offshore epipelagic areas with sea surface temperatures of 18–32°C (Eckert & Stewart 2001). Adult whale sharks reach an average size of 9.7 m and 9 tonnes, making them the largest non-cetacean animal in the world. They are slow-moving filter-feeders and therefore particularly vulnerable to ship strikes (Rowat 2007). Although primarily solitary animals, seasonal feeding aggregations occur at several coastal sites all over the world, those closest to the project area being off Sodwana Bay in KwaZulu Natal (KZN) in the Greater St. Lucia Wetland Park (Cliff *et al.* 2007). Satellite tagging has revealed that individuals may travel distances of tens of 1 000s of kms (Eckert & Stewart 2001; Rowat & Gore 2007; Brunnschweiler *et al.* 2009). On the West Coast their summer and winter distributions are centred around the Orange River mouth and between Cape Columbine and Cape Point (Harris *et al.* 2022). The likelihood of an encounter in the offshore waters of the Reconnaissance Permit Area is relatively low.

The whale shark and shortfin mako are listed in Appendix II (species in which trade must be controlled in order to avoid utilization incompatible with their survival) of CITES (Convention on International Trade in Endangered Species) and Appendix I and/or II of the Bonn Convention for the Conservation of Migratory Species (CMS). The whale shark is also listed as 'vulnerable' in the List of Marine Threatened or Protected Species (TOPS) as part of the National Environmental Management: Biodiversity Act (Act 10 of 2004) (NEMBA).

8.4.3.4 TURTLES

Three species of turtle occur along the West Coast, namely the Leatherback (*Dermochelys coriacea*) (Figure 32, left), and occasionally the Loggerhead (*Caretta caretta*) (Figure 32, right) and the Green (*Chelonia mydas*) turtle. Loggerhead and Green turtles are expected to occur only as occasional visitors along the West Coast. The most recent conservation status, which assessed the species on a sub-regional scale, is provided in Table 10.

The Leatherback is the only turtle likely to be encountered in the offshore waters of west South Africa. The Benguela ecosystem, especially the northern Benguela where jelly fish numbers are high, is increasingly being recognized as a potentially important feeding area for leatherback turtles from several globally significant nesting populations in the south Atlantic (Gabon, Brazil) and south east Indian Ocean (South Africa) (Lambardi *et al.* 2008, Elwen & Leeney 2011; SASTN 2011[2]). Leatherback turtles from the east South Africa population have been satellite tracked swimming around the west coast of South Africa and remaining in the warmer waters west of the Benguela ecosystem (Lambardi *et al.* 2008) (Figure 33).

Hughes & Nel (2014)	E	V	NT

NT – Near Threatened, V – Vulnerable, E – Endangered, CR – Critically Endangered, DD – Data Deficient, UR – Under Review, * - not yet assessed

Leatherback turtles inhabit deeper waters and are considered a pelagic species, travelling the ocean currents in search of their prey (primarily jellyfish). While hunting they may dive to over 600 m and remain submerged for up to 54 minutes (Hays et al. 2004). Their abundance in the study area is unknown but expected to be low. Leatherbacks feed on jellyfish and are known to have mistaken plastic marine debris for their natural food. Ingesting this can obstruct the gut, lead to absorption of toxins and reduce the absorption of nutrients from their real food. Leatherback Turtles are listed as 'Critically Endangered' worldwide by the IUCN and are in the highest categories in terms of need for conservation in CITES (Convention on International Trade in Endangered Species), and CMS (Convention on Migratory Species). The 2017 South African list of Threatened and Endangered Species (TOPS) similarly lists the species as 'Critically Endangered', whereas on the National Assessment (Hughes & Nel 2014) leatherbacks were listed as 'Endangered', whereas Loggerhead and green turtles are listed globally as 'Vulnerable' and 'Endangered', respectively, whereas on TOPS both species are listed as 'Endangered'. As a signatory of CMS, South Africa has endorsed and signed a CMS International Memorandum of Understanding specific to the conservation of marine turtles. South Africa is thus committed to conserve these species at an international level.

5428

Relative use (CUD, cumulative utilization distribution) of corridors is shown through intensity of shading: light, low use; dark, high use (adapted from Harris *et al.* 2018).

8.4.3.5 SEABIRDS

Large numbers of pelagic seabirds exploit the pelagic fish stocks of the Benguela system. Of the 49 species of seabirds that occur in the Benguela region, 14 are defined as resident, 10 are visitors from the northern hemisphere and 25 are migrants from the Southern Ocean. The species classified as being common in the southern Benguela are listed in Table 11. The area between Cape Point and the Orange River supports 38% and 33% of the overall population of pelagic seabirds in winter and summer, respectively. Most of the species in the region reach highest densities offshore of the shelf break (200 – 500 m depth), with highest population levels during their non-breeding season (winter). Pintado petrels and Prion spp. show the most marked variation here. Pelagic seabird species are therefore likely to be relatively frequently encountered in the offshore waters of the Reconnaissance Permit Area.

Fifteen species of seabirds breed in southern Africa; Cape Gannet (Figure 34, left), African Penguin (Figure 34, right), four species of Cormorant, White Pelican, three Gull and four Tern species (Table 12). The breeding areas are distributed around the coast with islands being especially important. The closest breeding islands to the Reconnaissance Permit Area are Bird Island in Lambert's Bay, the Saldanha Bay Islands and Dassen Island, which lie approximately 192 km,126 km and 150 km to the east and south east of the eastern and southern boundary of the Reconnaissance Permit Area, respectively. The number of successfully breeding birds at the particular breeding sites varies with food abundance. Most of the breeding seabird species forage at sea with most birds being found relatively close inshore (10-30 km). Cape Gannets, which breed at only three locations in South Africa (Bird Island Lamberts Bay, Malgas Island and Bird Island Algoa Bay) are known to forage within 200 km offshore (Dundee 2006; Ludynia 2007; Grémillet *et al.* 2008; Crawford *et al.* 2011), and African Penguins have also been recorded as far as 60 km offshore. The Application Area lies well offshore of the aggregate core home ranges of Cape Gannet and African Penguin (Figure 35) (BirdLife South Africa 2022). Aggregate core home ranges and foraging areas for Cape Cormorant and Bank Cormorant similarly lie well inshore of the Reconnaissance Permit Area (see Harris *et al.* 2022). There is, however, overlap of the foraging areas of Wandering Albatross and Atlantic Yellow-nosed Albatross with the Reconnaissance Permit Area (Figure 35) (BirdLife South Africa 2022; Harris *et al.* 2022).

Figure 34: Cape Gannets Morus capensis (left) (Photo: NACOMA) and African Penguins Spheniscus demersus (right) (Photo: Klaus Jost) breed primarily on the offshore islands.

Interactions with commercial fishing operations, either through incidental bycatch or competition for food resources, are the greatest threat to southern African seabirds, impacting 56% of seabirds of special concern. Crawford *et al.* (2014) reported that four of the seabirds assessed as 'Endangered' compete with South Africa's fisheries for food: African Penguins, Cape Gannets and Cape Cormorants for sardines and anchovies, and Bank Cormorants for rock lobsters (Crawford *et al.* 2015). Populations of seabirds off the West Coast have recently shown significant decreases, with the population numbers of African Penguins currently only 2.5% of what the population was 80 years ago; declining from 1 million breeding pairs in the 1920s, 25 000 pairs in 2009 and 15 000 in 2018 (Sink *et al.* 2019). For Cape Gannets, the global population decreased from about 250 000 pairs in the 1950s and 1960s to approximately 130 000 in 2018, primarily as a result of a >90% decrease in Namibia's population in response to the collapse of Namibia's sardine resource. In South Africa, numbers of Cape Gannets have increased since 1956 and South Africa now holds >90% of the global population. However, numbers have recently decreased in the Western Cape but increased in Algoa Bay mirroring the southward and eastward shift sardine and anchovy. Algoa Bay currently holds approximately 75% of the South African Gannet population.

Cape cormorants and Bank cormorants showed a substantial decline from the late 1970s/early 1980s to the late 2000s/early 2010s, with numbers of Cape cormorants dropping from 106 500 to 65 800 breeding pairs, and Bank cormorants from 1 500 to only 800 breeding pairs over that period (Crawford *et al.* 2015).

Demersal and pelagic longlining are key contributors to the mortality of albatrosses (Browed albatross 7%, Indian and Atlantic Yellow-Nosed Albatross 3%), petrels (white-chinned petrel 66%), shearwaters and Cape Gannets (2%) through accidental capture (bycatch and/or entanglement in fishing gear), with an estimated annual mortality of 450 individuals of 14 species for the period 2006 to 2013 (Rollinson *et al.* 2017). Other threats

include predation by mice on petrel and albatross chicks on sub-Antarctic islands, predation of chicks of Cape, Crowned and Bank Cormorants by Great White Pelicans, and predation of eggs and chicks of African Penguins, Bank, Cape and Crowned Cormorants by Kelp gulls. Disease (avian flu), climate change (heat stress and environmental variability) and oil spills are also considered major contributors to seabird declines (Sink *et al.* 2019).

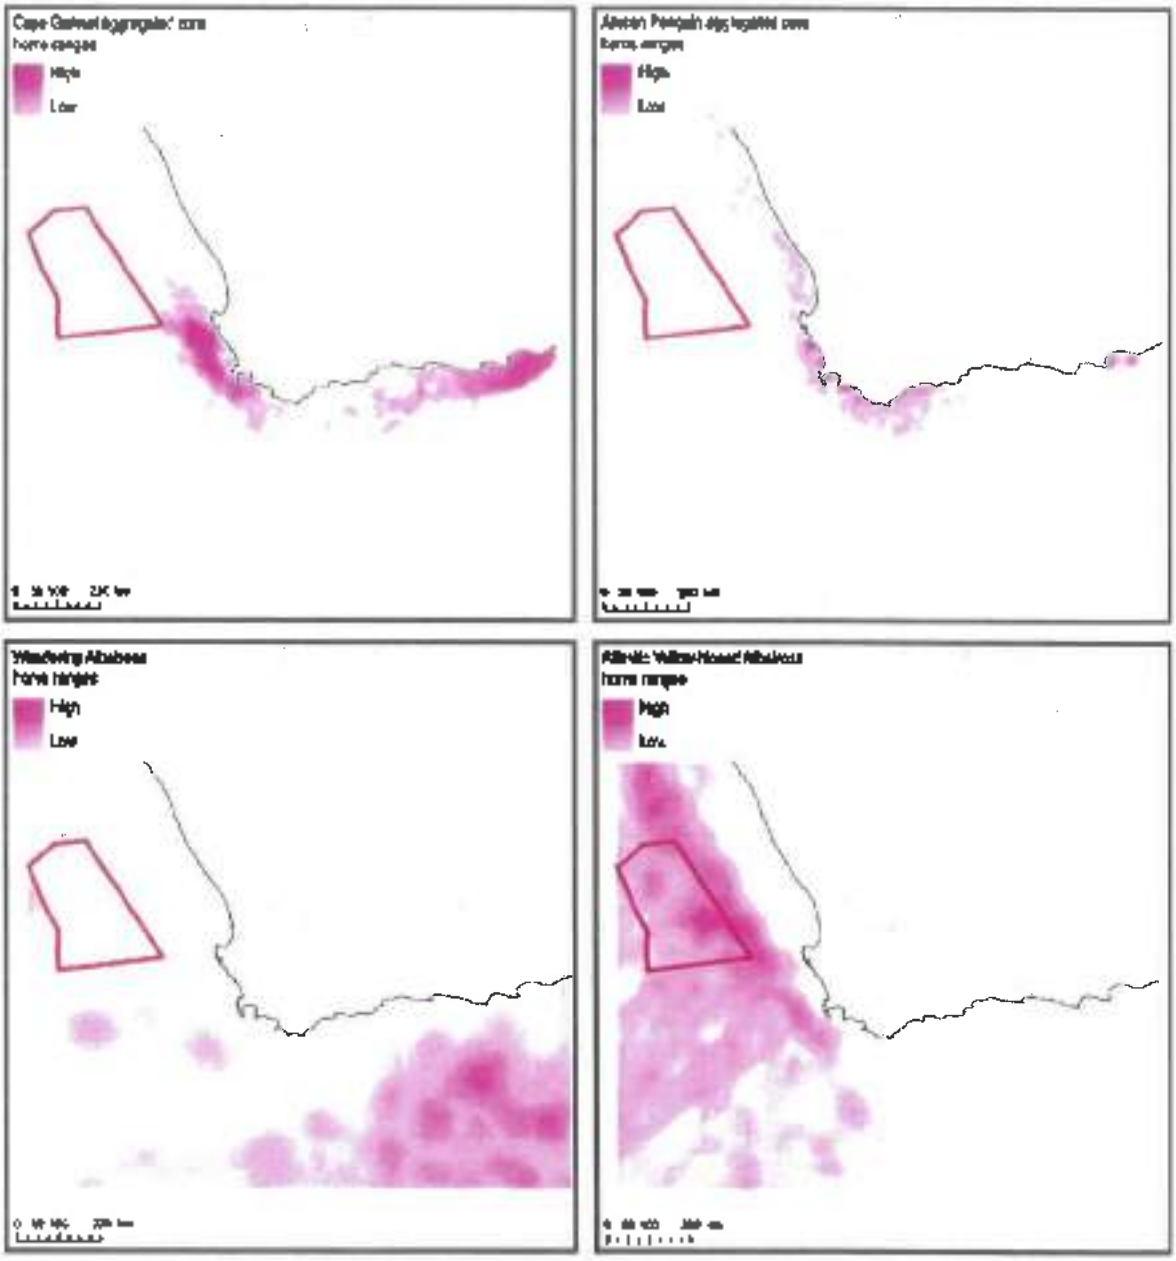

Figure 35: The Reconnaissance Permit Area (red polygon) in relation to aggregate core home ranges of Cape Gannet (top left), *African Penguin* (top right) for different colonies and life-history stages, and foraging areas of Wandering Albatross (bottom left) and Atlantic Yellow-nosed Albatross (bottom right). For foraging areas, darker shades are areas of higher use and where foraging areas from different colonies overlap (adapted from Harris *et al.* 2022).

8.4.3.6 MARINE MAMMALS

The marine mammal fauna occurring off the southern African coast includes several species of whales and dolphins and one resident seal species. Thirty-three species of whales and dolphins are known (based on historic sightings or strandings records) or likely (based on habitat projections of known species parameters) to occur in these waters (Table 13). Of the species listed, the blue whale is considered 'Critically Endangered', fin and sei

whales are 'Endangered' and one is considered vulnerable (IUCN Red Data list Categories). Altogether 17 species are listed as 'data deficient' underlining how little is known about cetaceans, their distributions and population trends. The offshore areas have been particularly poorly studied with most available information from deeper waters (>200 m) arising from historic whaling records prior to 1970. In the past ten years, passive acoustic monitoring and satellite telemetry have begun to shed light on current patterns of seasonality and movement for some large whale species (Best *et al.* 2009; Elwen *et al.* 2011; Rosenbaum *et al.* 2014; Shabangu *et al.* 2019; Thomisch *et al.* 2019) but information on smaller cetaceans in deeper waters remains poor. Records from marine mammal observers on seismic survey vessels have provided valuable data into cetacean presence although these are predominantly during summer months (Purdon *et al.* 2020). Information on general distribution and seasonality is improving but data population sizes and trends for most cetacean species occurring on the west coast of southern Africa is lacking.

The 3D acquisition area extends from the Namibian border to 32°27' offshore of St Helena Bay from roughly the 500 m isobath to nearly 4 000 m water depth. Oceanographically this area lies largely outside the cool waters of the Benguela Ecosystem and receives some input from the warm Agulhas Current as well as the warm waters of the South Atlantic. In terms of cetacean distribution patterns, the area thus covers a broad range of habitats and species associated with each of those water masses may occur within the target area. Records from stranded specimens show that the area between St Helena Bay (~32° S) and Cape Agulhas (~34° S, 20° E) is an area of transition between Atlantic and Indian Ocean species, and includes records from Benguela associated species such as dusky dolphins, Heaviside's dolphins and long finned pilot whales, and those of the warmer east coast such as striped and Risso's dolphins (Findlay *et al.* 1992). Species such as rough toothed dolphins, Pan-tropical spotted dolphins and short finned pilot whales are known from the southern Atlantic. Owing to the uncertainty of species occurrence offshore, species that may occur there have been included here for the sake of completeness.

The distribution of cetaceans can largely be split into those associated with the continental shelf and those that occur in deep, oceanic water. Importantly, species from both environments may be found on the continental slope (200 – 2 000 m) making this the most species rich area for cetaceans and also high in density (De Rock *et al.* 2019; SLR data). Cetacean density on the continental shelf is usually higher than in pelagic waters as species associated with the pelagic environment tend to be wide ranging across 1 000s of km. The most common species within the project area (in terms of likely encounter rate not total population sizes) are likely to be the long-finned pilot whale, Risso's dolphin, common dolphin, sperm whale (winter distribution) and humpback whale (Figure 36) (Harris *et al.* 2022).

Cetaceans are comprised of two taxonomic groups, the mysticetes (filter feeders with baleen) and the odontocetes (predatory whales and dolphins with teeth). The term 'whale' is used to describe species in both groups and is taxonomically meaningless (e.g. the killer whale and pilot whale are members of the Odontoceti, family Delphinidae and are thus dolphins). Due to differences in sociality, communication abilities, ranging behaviour and acoustic behaviour, these two groups are considered separately.

Table 13 lists the cetaceans likely to be found within the project area, based on all available data sources but mainly: Findlay et al. (1992), Best (2007), Weir (2011), De Rock et al. (2019), Purdon et al. (2020a, 2020b, 2020c), and unpublished records held by Sea Search and those held by SLR consulting and shared for this report (see also Figure 37, Figure 38, Figure 40). The majority of data available on the seasonality and distribution of large whales in the project area is the result of commercial whaling activities mostly dating from the 1960s. Changes in the timing and distribution of migration may have occurred since these data were collected due to extirpation of populations or behaviours (e.g. migration routes may be learnt behaviours). The large whale species for which there are current data available are the humpback and southern right whale, although almost all data is limited to that collected on the continental shelf close to shore. A review of the distribution and seasonality of the key cetacean species likely to be found within the project area is provided below.

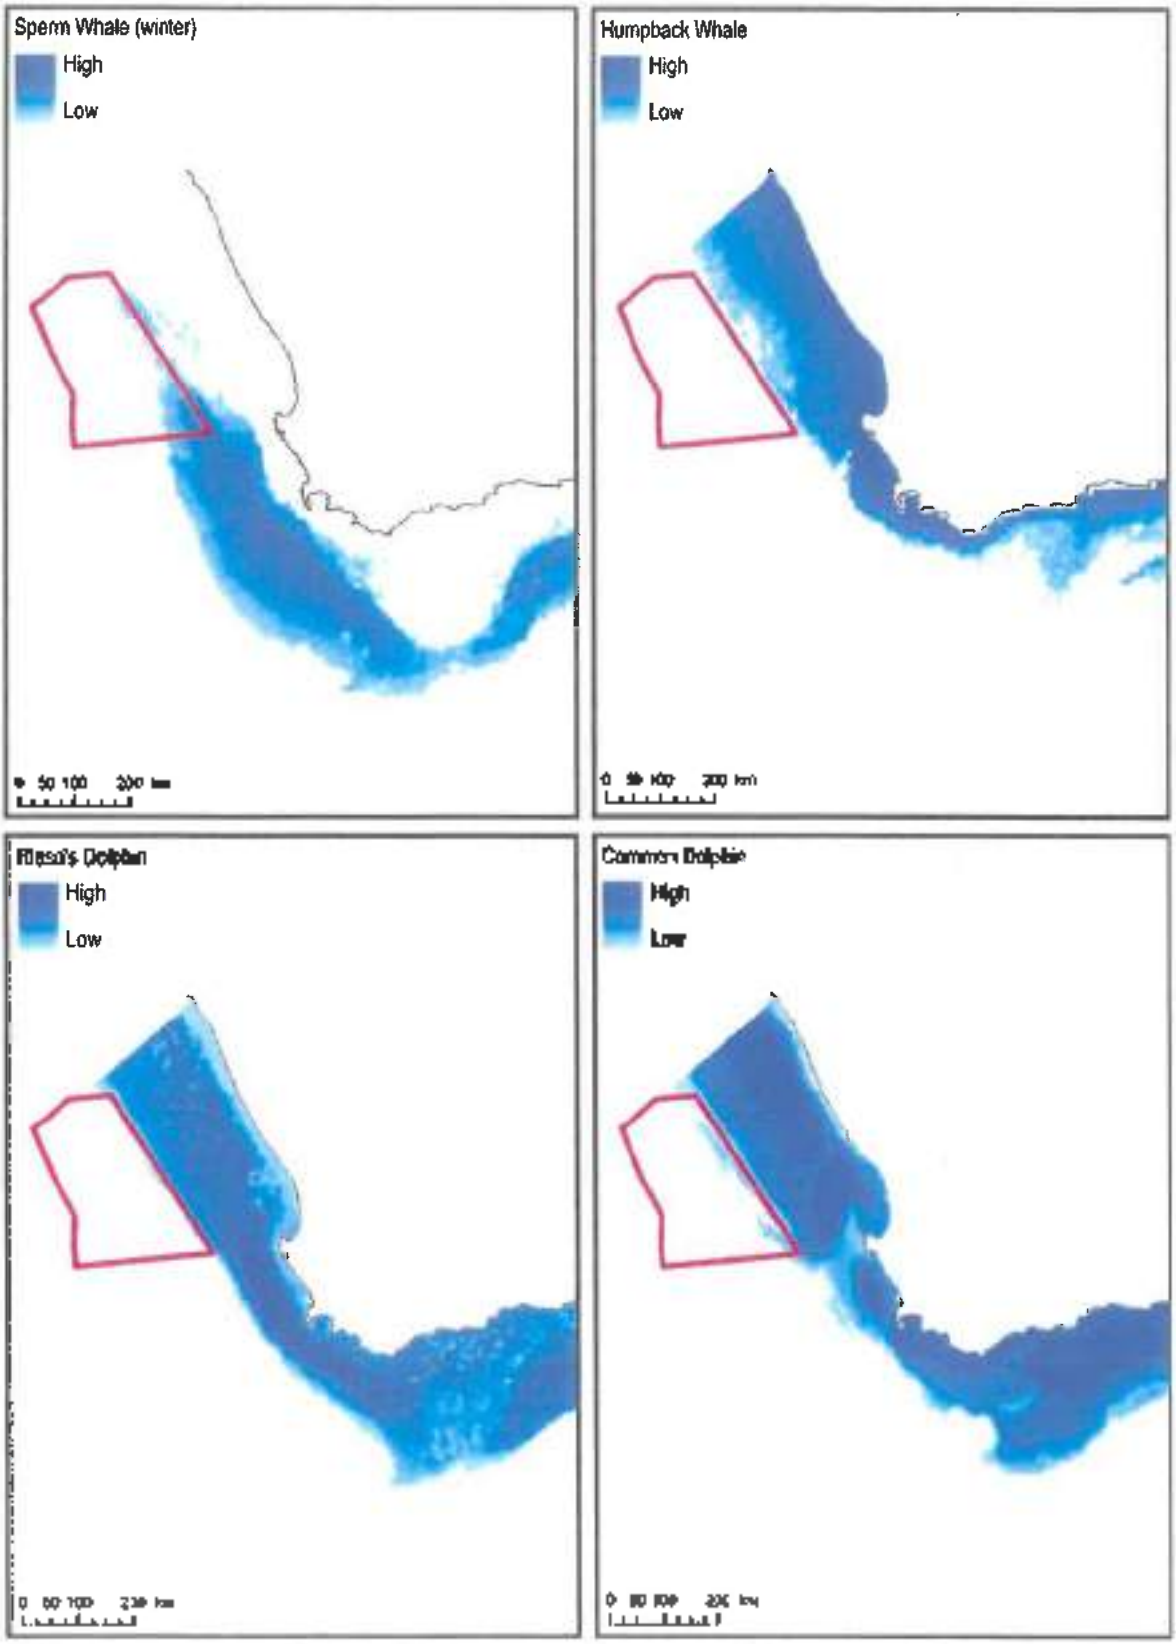

Figure 36: The Reconnaissance Permit Area (red polygon) in relation to the predicted distribution of Sperm whales (winter distribution)(left), humpback whale (middle) and Risso's dolphin (right) with darker shades of blue indicating highest likelihood of occurrence (adapted from Harris *et al.* 2022).

8.4.3.6.1 MYSTICETE (BALEEN) WHALES

The majority of mysticetes whales fall into the family Balaenopteridae. Those occurring in the area include the blue, fin, sei, Antarctic minke, dwarf minke, humpback and Bryde's whales. The southern right whale (Family Balaenidae) and pygmy right whale (Family Neobalaenidae) are from taxonomically separate groups. The majority of mysticete species occur in pelagic waters with only occasional visits to shelf waters. All of these species show some degree of migration either to or through the latitudes encompassed by the broader project area when enroute between higher latitude (Antarctic or Subantarctic) feeding grounds and lower latitude breeding grounds.

Depending on the ultimate location of these feeding and breeding grounds, seasonality may be either unimodal, usually in winter months, or bimodal (e.g. May to July and October to November), reflecting a northward and southward migration through the area. Northward and southward migrations may take place at different distances from the coast due to whales following geographic or oceanographic features, thereby influencing the seasonality of occurrence at different locations. Because of the complexities of the migration patterns, each species is discussed separately below.

Bryde's whales: Two genetically and morphologically distinct populations of Bryde's whales (Figure 39, left) live off the coast of southern Africa (Best 2001; Penry 2010). The "offshore population" lives beyond the shelf (>200 m depth) off west Africa and migrates between wintering grounds off equatorial west Africa (Gabon) and summering grounds off western South Africa. Its seasonality on the West Coast is thus opposite to the majority of the balaenopterids with abundance likely to be highest in the area in January - March. The "inshore population" of Bryde's whale live mainly on the continental shelf and Agulhas Bank, and are unique amongst baleen whales in the region by being non-migratory. The inshore population has recently been recognised as its own (yet to be named) sub species (*Balaenoptera brydei edeni*, Penry *et al.* 2018) with a total population for this subspecies of likely fewer than 600 individuals. The published range of the population is the continental shelf and Agulhas Bank of South Africa ranging from Durban in the east to at least St Helena Bay off the west coast with possible movements further north up the West Coast and into Namibia during the winter months (Best 2007). The offshore stock was subjected to heavy whaling in the mid-20th century (Best 2001) and there are no current data on population size or stock recovery therefrom and is currently listed as 'Data deficient' on the South African Red List. The inshore stock is regarded as extremely 'Vulnerable' and listed as such on the South African red list as it regularly suffers losses from entanglement in trap fisheries and has been subject to significant changes in its prey base due to losses and shifts in the sardine and small pelgic stocks around South Africa.

Sei whales: Almost all information is based on whaling records 1958-1963, most from shore-based catchers operating within a few hundred kilometres of Saldanha Bay. At this time the species was not well differentiated from Bryde's whales and records and catches of the two species intertwined. There is no current information on population recovery, abundance or much information on distribution patterns outside of the whaling catches and the species remains listed as 'Endangered' on the SA Red List. Sei whales feed at high latitudes (40-50°S) during summer months and migrate north through South African waters to unknown breeding grounds further north (Best 2007). Their migration pattern thus shows a bimodal peak with numbers west of Saldanha Bay being highest in May and June, and again in August, September and October. All whales were caught in waters deeper than 200 m with most deeper than 1 000 m (Best & Lockyer 2002). A recent survey to Vema Seamount ~1 000 km west of Cape Town during Oct-Nov 2019, encountered a broadly spread feeding aggregation of over 30 sei and fin whales at around 200 m water depth (Elwen *et al.* in prep.). This poorly surveyed area (roughly 32°S, 15°E) is just to the NW of the historic whaling grounds suggesting this region remains an important feeding area for the species. This region lies well within the impact area of the proposed 3D seismic survey and caution is recommended to reduce impacts on this endangered and poorly known species.

Marine animals do not hear equally well at all frequencies within their functional hearing range. Based on the hearing range and sensitivities, Southall et al. (2019) have categorised noise sensitive marine mammal species into six underwater hearing groups: low-frequency (LF), high-frequency (HF) and very high-frequency (VHF) cetaceans, Sirenians (SI), Phocid carnivores in water (PCW) and other marine carnivores in water (OCW).

Table 14: Seasonality of baleen whales in the broader project area based on data from multiple sources, predominantly commercial catches (Best 2007 and other sources) and data from stranding events (NDP unpubl data).

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Bryde's Inshore	L	L	M	M	M	M	M	L	L	M	M	L
Sei	M	L	L	L	H	H	M	H	H	H	M	M
Fin	M	M	M	M	H	H	H	L	L	H	H	M
Blue	L	L	L	L	M	M	M	L	L	L	L	L
Minke	M	M	M	H	H	H	M	H	H	H	M	M
Humpback	H	M	L	L	L	M	M	M	H	H	H	H
Southern Right	H	M	L	L	L	M	M	M	H	H	H	H

Values of high (H), Medium (M) and Low (L) are relative within each row (species) and not comparable between species. For abundance / likely occupancy rate within the broader project area, see Table 9.

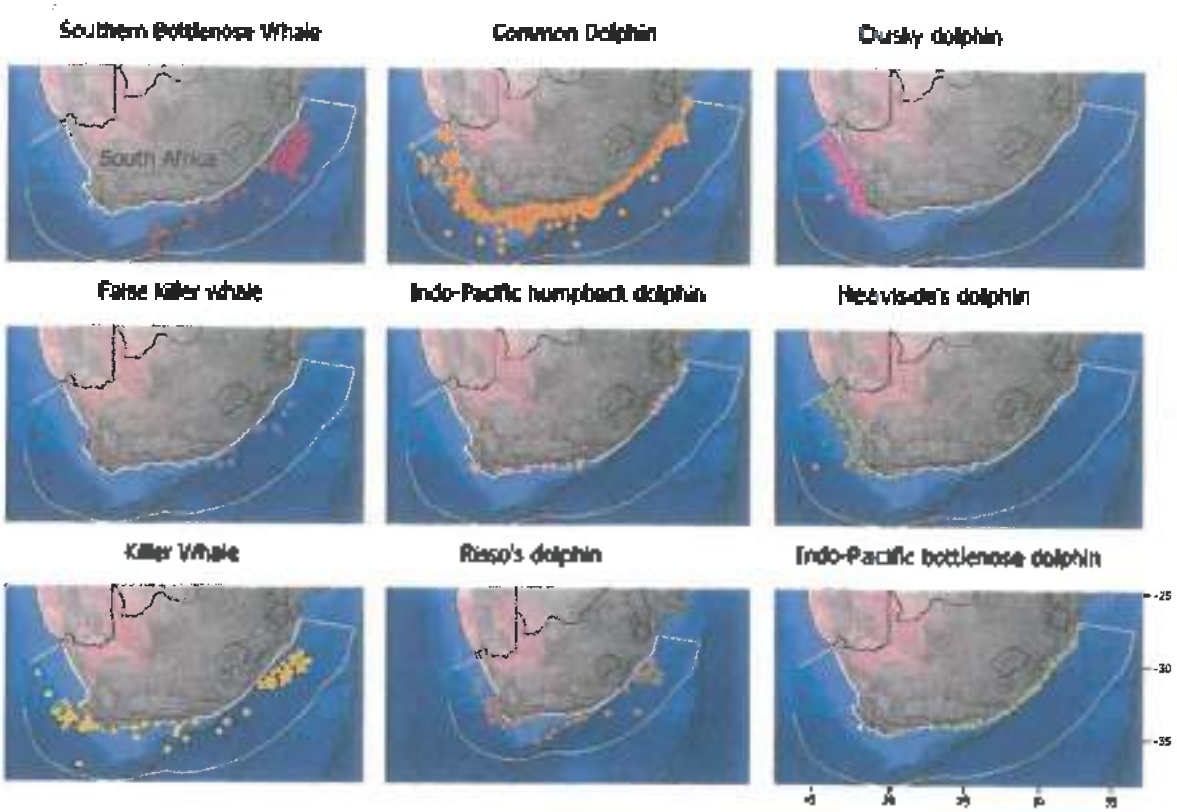

Figure 40: The Reconnaissance Permit area (cyan polygon) in relation to projections of predicted distributions for nine odontocete species off the West Coast of South Africa (adapted from: Purdon *et al.* 2020a).

Fin whales: Fin whales were historically caught off the West Coast of South Africa, with a bimodal peak in the catch data suggesting animals were migrating further north during May-June to breed, before returning during August-October *en route* to Antarctic feeding grounds. However, the location of the breeding ground (if any) and how far north it is remains a mystery (Best 2007). Some juvenile animals may feed year round in deeper waters off the shelf (Best 2007). Aggregations of up to eight animals have been seen on multiple occasions on the coast either side of Lüderitz in Apr-May of 2014 and January 2015 (Sea Search unpubl. Data), the occasional single whale has been reported during humpback whale research in November in the southern Benguela, and a feeding aggregation of ~30 animals was observed in November 2019 ~200 km west of St Helena Bay in ~2 000 m of water (see above). Current sightings records support the bimodal peak in presence observed from whaling data (but with some chance of year-round sightings) with animals apparently feeding in the nutrient rich Benguela during their southward migration as is observed extensively for humpback and right whales (see below) there clearly is a chance of encounters year round. There are no recent data on abundance or distribution of fin whales off western South Africa.

Blue whales: Although Antarctic blue whales were historically caught in high numbers off the South African West Coast, with a single peak in catch rates during July in Namibia and Angola suggesting that these latitudes are close to the northern migration limit for the species in the eastern South Atlantic (Best 2007). Although there were only two confirmed sightings of the species in the area between 1979 and 2006 (Branch *et al.* 2007), evidence of blue whale presence off Namibia is increasing. Recent acoustic detections of blue whales in the Antarctic peak between December and January (Širović *et al.* 2016), off western South Africa (Shabangu *et al.* 2019) and in northern Namibia between May and July (Thomisch 2017) supporting observed timing from whaling records. Several recent (2014-2015) sightings of blue whales during seismic surveys off the southern part of Namibia (water depth >1 000 m) confirm their existence in the area and occurrence in Autumn months. The chance of encountering the species in the Application Area is considered low but the species is 'Critically Endangered' so all precautions must be taken to avoid impact.

Minke whales: Two forms of minke whale (Figure 39, right) occur in the southern Hemisphere, the Antarctic minke whale (*Balaenoptera bonaerensis*) and the dwarf minke whale (*B. acutorostrata* subsp.); both species occur in the Benguela (Best 2007). Antarctic minke whales range from the pack ice of Antarctica to tropical

waters and are usually seen more than ~50 km offshore. Although adults migrate from the Southern Ocean (summer) to tropical/temperate waters (winter) to breed, some animals, especially juveniles, are known to stay in tropical/temperate waters year-round. Recent data available from passive acoustic monitoring over a two-year period off the Walvis Ridge shows acoustic presence in June - August and November - December (Thomisch *et al.* 2016), supporting a bimodal distribution in the area. The dwarf minke whale has a more temperate distribution than the Antarctic minke and they do not range further south than 60-65°S. Dwarf minkes have a similar migration pattern to Antarctic minkes with at least some animals migrating to the Southern Ocean during summer. Dwarf minke whales occur closer to shore than Antarctic minkes and have been seen <2 km from shore on several occasions around South Africa. Both species are generally solitary and densities are likely to be low in the project area, although sightings have been reported (SLR data).

The pygmy right whale is the smallest of the baleen whales reaching only 6 m total length as an adult (Best 2007). The species is typically associated with cool temperate waters between 30°S and 55°S with records from southern and central Namibia being the northern most for the species (Leeney *et al.* 2013). Its distribution off the west coast of South Africa is thus likely to be limited to the cooler shelf waters of the main Benguela upwelling areas.

The most abundant baleen whales in the Benguela are southern right whales and humpback whales (Figure 41a & b). Both species have long been known to feed in the Benguela Ecosystem and numbers since 2000 here grown substantially. The feeding peak in the Benguela is spring and early summer (October – February) and follows the 'traditional' South African breeding season (June – November) and its' associated migrations (Johnson *et al.* 2022). Some individual right whales are known to move directly from the south coast breeding area into the west coast feeding area where they remained for several months (Barendse *et al.* 2011; Mate *et al.* 2011). Increasing numbers of summer records of both species, from the southern half of Namibia suggest that animals may also be feeding in the Lüderitz upwelling cell (NDP unpubl. data).

Humpback whales: The majority of humpback whales passing through the Benguela are migrating to breeding grounds off tropical west Africa, between Angola and the Gulf of Guinea (Rosenbaum *et al.* 2009; Barendse *et al.* 2010). Until recently it was believed that that these breeding grounds were functionally separate from those off east (Mozambique-Kenya-Madagascar), with only rare movements between them (Pomilla & Rosenbaum 2005) and movements to other continental breeding grounds being even more rare. Recent satellite tagging of animals between Plettenberg Bay and Port Alfred during the northward migration, showed them to turn around and end up feeding in the Southern Benguela (Saakamela *et al.* 2015) before heading offshore and southwards using the same route as whales tracked off Gabon and the West Coast of South Africa. Unexpected results such as this highlight the complexities of understanding whale movements and distribution patterns and the fact that descriptions of broad season peaks in no way captures the wide array of behaviours exhibited by these animals. Furthermore, three separate matches have been made between individuals off South Africa and Brazil by citizen scientist photo-identification (www.happywhale.com). This included whales from the Cape Town and Algoa Bay-Transkei areas. Analysis of humpback whale breeding song on Sub-Antarctic feeding grounds also suggests exchange of singing male whales from western and eastern South Atlantic populations (Darling & Sousa-Lima 2005; Schall *et al.* 2021; but see also Darling *et al.* 2019; Tyaris *et al.* 2021).

Figure 41: The Humpback whale *Megaptera novaeangliae* (left) and the Southern Right whale *Eubalaena australis* (right) are the most abundant large cetaceans occurring along the southern African West Coast (Photos: www.divephotoguide.com; www.aad.gov.au).

In southern African coastal waters, the northward migration stream is larger than the southward peak (Best & Allison 2010; Elwen *et al.* 2014), suggesting that animals migrating north strike the coast at varying places north of St Helena Bay, resulting in increasing whale density on shelf waters and into deeper pelagic waters as one moves northwards. On the southward migration, many humpbacks follow the Walvis Ridge offshore then head directly to high latitude feeding grounds, while others follow a more coastal route (including the majority of mother-calf pairs) possibly lingering in the feeding grounds off west South Africa in summer (Elwen *et al.* 2014; Rosenbaum *et al.* 2014). Although migrating through the Benguela, there is no existing evidence of a clear 'corridor' and humpback whales appear to be spread out widely across the shelf and into deeper pelagic waters, especially during the southward migration (Barendse *et al.* 2010; Best & Allison 2010; Elwen *et al.* 2014). The only available abundance estimate put the number of animals in the West African breeding population (Gabon) to be in excess of 9 000 individuals in 2005 (IWC 2012) and it is likely to have increased substantially since this time at about 5% per annum (IWC 2012; see also Wilkinson 2021). The number of humpback whales feeding in the southern Benguela has increased substantially since estimates made in the early 2000s (Barendse *et al.* 2011). Since ~2011, 'supergroups' of up to 200 individual whales have been observed feeding within 10 km from shore (Findlay *et al.* 2017) with many hundred more passing through and whales are now seen in all months of the year around Cape Town. It has been suggested that the formation of these super-groups may be in response to anomalous oceanographic conditions in the Southern Benguela, which result in favourable food availability, thereby leading to these unique humpback whale feeding aggregations (Dey *et al.* 2021; see also Avila *et al.* 2019; Meynecke *et al.* 2020; Cade *et al.* 2021). Humpback whales are thus likely to be the most frequently encountered baleen whale in the project area (see Figure 29b), ranging from the coast out beyond the shelf, with year round presence but numbers peaking during the northward migration in June – February and a smaller peak with the southern breeding migration around September – October but with regular encounters until February associated with subsequent feeding in the Benguela ecosystem.

In the first half of 2017 (when numbers are expected to be at their lowest) more than 10 humpback whales were reported stranded along the Namibian and South African west coasts. A similar event was recorded in late 2021-early 2022 when numerous strandings of young humpbacks were reported along the Western Cape Coast and in Namibia (Simon Elwen, Sea Search, pers. comm.). The cause of these deaths is not known, but a similar event off Brazil in 2010 (Siciliano *et al.* 2013) was linked to possible infectious disease or malnutrition. Unusual mortality events of humpback whales between 2016 and 2022 have similarly been reported along the US Atlantic Coast from Maine to Florida (https://www.fisheries.noaa.gov/national/marine-life-distress/2016-2022-humpback-whale-unusual-mortality-event-along-atlantic-coast). The West African population may be undergoing similar stresses in response to changes in their ecosystem (see for example Kershaw *et al.* 2021). It is not yet understood what may be driving these ecosystem changes and what the long-term effects to populations could potentially be.

Southern right whales: The southern African population of southern right whales historically extended from southern Mozambique (Maputo Bay) to southern Angola (Baie dos Tigres) and is considered to be a single population within this range (Roux *et al.* 2011). The most recent abundance estimate for this population is available for 2017 which estimated the population at ~6 100 individuals including all age and sex classes, and still growing at ~6.5% per annum (Brandão *et al.* 2017). When the population numbers crashed in 1920, the range contracted down to just the south coast of South Africa, but as the population recovers, it is repopulating its historic grounds including Namibia (Roux *et al.* 2001, 2015; de Rock *et al.* 2019) and Mozambique (Banks *et al.* 2011).

Some southern right whales move from the South Coast breeding ground directly to the West Coast feeding ground (Mate *et al.* 2011). When departing from feeding ground all satellite tagged animals in that study took a direct south-westward track. Mark-recapture data from 2003-2007 estimated roughly one third of the South African right whale population at that time were using St Helena Bay for feeding (Peters *et al.* 2005). While annual surveys have revealed a steady population increase since the protection of the species from commercial whaling, the South African right whale population has undergone substantial changes in breeding cycles and feeding areas, and numbers of animal using our coast since those studies were done – notably a significant decrease in the numbers of cow-calf-pairs following the all-time record in 2018, a marked decline of unaccompanied adults since 2010 and variable presence of mother-calf pairs since 2015 (Roux *et al.* 2015; Vermeulen *et al.* 2020). The change in demographics are indications of a population undergoing nutritional stress and has been attributed to likely spatial and/or temporal displacement of prey due to climate variability (Vermeulen *et al.* 2020; see also Derville *et al.* 2019, 2020; Kershaw *et al.* 2021; van Weelden *et al.* 2021). Recent sightings (2018-2021) confirm that there is still a clear peak in numbers on the West Coast (Table Bay to St

Helena Bay) between February and April. Given this high proportion of the population known to feed in the southern Benguela, and current numbers reported, it is highly likely that several hundreds of right whales can be expected to pass through the southern portion of the Reconnaissance Permit Area when migrating southwards from the feeding areas between April and June (Figure 42).

Figure 42: The Reconnaissance Permit Area (red polygon) in relation to 'blue corridors' or 'whale superhighways' showing tracks of Humpback whales (orange) and Southern Right whales (green) between southern Africa and the Southern Ocean feeding grounds (adapted from Johnson *et al.* 2022).

8.4.3.6.2 ODONTOCETES (TOOTHED) WHALES

The Odontoceti are a varied group of animals including the dolphins, porpoises, beaked whales and sperm whales. Species occurring within the broader project area display a diversity of features, for example their ranging patterns vary from extremely coastal and highly site specific to oceanic and wide ranging (see Figure 40). Those in the region can range in size from 1.6-m long (Heaviside's dolphin) to 17 m (bull sperm whale).

Sperm whales: Most information about sperm whales in the southern African sub-region results from data collected during commercial whaling activities prior to 1985 when over 10 000 whales were taken, although passive acoustic monitoring (Shabangu & Andrew 2020) and sightings from MMOs are beginning to provide insights into current behaviour. Sperm whales are the largest of the toothed whales and have a complex,

F498

structured social system with adult males behaving differently to younger males and female groups. They live in deep ocean waters, usually greater than 1 000 m depth, although they occasionally come onto the shelf in water 500 - 200 m deep (Best 2007) (Figure 43, left). They are considered to be relatively abundant globally (Whitehead 2002), although no estimates are available for South African waters. Seasonality of catches suggests that medium and large sized males are more abundant in winter months while female groups are more abundant in autumn (March - April), although animals occur year round (Best 2007). Analysis of recent passive acoustic monitoring data from the edge of the continental shelf (800 - 1 000 m water depth, roughly 80 km WSW of Cape Point) confirms year-round presence. Sperm whales have also been regularly identified by MMOs working in this area (SLR data). Sperm whales feed at great depths during dives in excess of 30 minutes making them difficult to detect visually, however the regular echolocation clicks made by the species when diving make them relatively easy to detect acoustically using Passive Acoustic Monitoring (PAM).

Figure 43: Sperm whales *Physeter macrocephalus* (left) and killer whales *Orcinus orca* (right) are toothed whales likely to be encountered in offshore waters (Photos: www.onpoint.wbur.org; www.wikipedia.org).

Pygmy and Dwarf Sperm Whales: The genus *Kogia* currently contains two recognised species, the pygmy (*K. breviceps*) and dwarf (*K. sima*) sperm whales, both of which occur worldwide in pelagic and shelf edge waters, with with few sighting records of live animals in their natural habitat (McAlpine 2018). Their abundance, population trends and seasonality in South African waters are unknown (Seakamela *et al.* 2021). Due to their small body size, cryptic behaviour, low densities and small school sizes, these whales are difficult to observe at sea, and morphological similarities make field identification to species level problematic, although their narrow-band high frequency echolocation clicks make them detectable and identifiable (at least to the genus) using passive acoustic monitoring equipment. The majority of what is known about the distribution and ecology of Kogiid whales in the southern African subregion is derived mainly from stranding records (e.g. Ross 1979; Findlay *et al.* 1992; Plön 2004; Elwen *et al.* 2013, but see also Moura *et al.* 2016). *Kogia* species are most frequently occur in pelagic and shelf edge waters, are thus likely to occur in the Application Area at low levels; seasonality is unknown. Dwarf sperm whales are associated with warmer tropical and warm-temperate waters, being recorded from both the Benguela and Agulhas ecosystem (Best 2007) in waters deeper than ~1 000 m.

During 2020 the incidence of kogiid strandings between Strandfontein on the West Coast and Groot Brak River on the South Coast (n=17), was considerably higher than the annual average during the previous 10 years (n=7). The dwarf sperm whale (*K. sima*) accounted for 60% of these strandings, of which most were recorded during autumn and winter. These seasonal stranding patterns are consistent with previously published accounts for the South African coast. In 2020, 40% of the total strandings were recorded in winter and 15% during summer. The occurrence of strandings throughout the year may, however, indicate the presence of a resident population with a seasonal distribution off the South Coast in autumn and winter (Seakamela *et al.* 2020, 2021). The cause of the strandings is unknown.

Killer whales: Killer whales in South African waters were referred to a single morphotype, Type A, although recently a second 'flat-toothed' morphotype that seems to specialise in an elasmobranch diet has been identified but only 5 records are known all from strandings (Best *et al.* 2014). Killer whales (Figure 43) have a circum-global distribution being found in all oceans from the equator to the ice edge (Best 2007). Killer whales occur year-round in low densities off South Africa (Best *et al.* 2010, Elwen *et al.* In prep.), Namibia (Elwen & Leeney 2011) and in the Eastern Tropical Atlantic (Weir *et al.* 2010). Historically sightings were correlated with that of baleen whales, especially sei whales on their southward migration. In more recent years – their presence in coastal waters (e.g. False Bay) has been strongly linked to the presence and hunting of common dolphins (Best *et al.* 2010; Sea Search unpublished data). Further from shore, there have been regular reports of killer whales

FC28

associated with long-line fishing vessels on the southern and eastern Agulhas Bank, and the Cape Canyon to the south-west of Cape Point. Killer whales are found in all depths from the coast to deep open ocean environments and may thus be encountered in the project area at low levels.

False killer whale: Although the false killer whale is globally recognized as one species, clear differences in morphological and genetic characteristics between different study sites show that there is substantial difference between populations and a revision of the species taxonomy may be needed (Best 2007). False killer whales are more likely to be confused with the smaller melon-headed or pygmy killer whales with which they share all-black colouring and a similar head-shape, than with killer whales. The species has a tropical to temperate distribution and most sightings off southern Africa have occurred in water deeper than 1 000 m, but with a few recorded close to shore (Findlay *et al.* 1992). They usually occur in groups ranging in size from 1 - 100 animals (Best 2007). The strong bonds and matrilineal social structure of this species makes it vulnerable to mass stranding (8 instances of 4 or more animals stranding together have occurred in the Western Cape, all between St Helena Bay and Cape Agulhas). There is no information on population numbers or conservation status and no evidence of seasonality in the region (Best 2007).

Pilot Whales: Long finned pilot whales display a preference for temperate waters and are usually associated with the continental shelf or deep water adjacent to it, but moving inshore to follow prey (primarily squid) (Mate *et al.* 2005; Findlay *et al.* 1992; Weir 2011; Seakamela *et al.* 2022). They are regularly seen associated with the shelf edge by MMOs, fisheries observers and researchers. The distinction between long-finned and short finned pilot whales is difficult to make at sea. As the latter are regarded as more tropical species confined to the southwest Indian Ocean (Best 2007), it is likely that the majority of pilot whales encountered in the project area will be long-finned. There are many confirmed sightings of pilot whales along the shelf edge of South Africa and Namibia including within the Application Area since 2010 (de Bock *et al.* 2019; Sea Search unpublished data, SLR data). Observed group sizes range from 8-100 individuals (Seakamela *et al.* 2022). Pilot whales are commonly sighting by MMOs and detected by PAM during a seismic surveys. A recent tagging study showed long-finned pilot whale movements within latitudes of 33-36°S, along the shelf-edge from offshore of Cape Columbine to the Agulhas Bank, with concentrations in canyon areas, especially around the Cape Point Valley, and to a lesser degree around the Cape Canyon. It is postulated that the pilot whales target prey species in these productive areas (Seakamela *et al.* 2022).

Common dolphin: Two forms of common dolphins occur around southern Africa, a long-beaked and short-beaked form (Findlay *et al.* 1992; Best 2007), although they are currently considered part of a single global species (Cunha *et al.* 2015). The long-beaked common dolphin lives on the continental shelf of south Africa rarely being observed north of St Helena Bay on the west coast or in waters more 500 m deep (Best 2007), although more recent sightings, including those from MMOs, suggest sightings regularly out to 1 000 m or more (SLR data, Sea Search data). Group sizes of common dolphins can be large, averaging 267 (± SD 287) for the South Africa region. Far less is known about the short-beaked form, which is challenging to differentiate at sea from the long-beaked form. Group sizes are also typically large. It is likely that common dolphins encountered in the Northern Cape or deeper than 2 000 m are of the short-beaked form.

Dusky dolphin: In water <500 m deep, dusky dolphins (Figure 44, right) are likely to be the most frequently encountered small cetacean as they are very "boat friendly" and often approach vessels to bowride. The species is resident year round throughout the Benguela ecosystem in waters from the coast to at least 500 m deep (Findlay *et al.* 1992). A recent abundance estimate from southern Namibia calculated roughly ~3 500 dolphins in the ~400 km long Namibian Islands Marine Protected area (Martin *et al.* 2020), at a density of 0.16 dolphins/km^2 and similar density is expected to occur off the South African coast where they are regularly encountered in near shore waters between Cape Town and Lamberts Bay (Elwen *et al.* 2030; NDP unpubl. data) with group sizes of up to 800 having been reported. Dusky dolphins are resident year round in the Benguela.

Heaviside's dolphins: Heaviside's dolphins (Figure 44, left) are relatively abundant in the Benguela ecosystem region with 10 000 animals estimated to live in the 400 km of coast between Cape Town and Lambert's Bay (Elwen *et al.* 2009) and ~1 600 in the ~400 km long Namibian Islands Marine Protected Area (Martin *et al.* 2020). This species occupies waters from the coast to at least 200 m depth, and may show a diurnal onshore-offshore movement pattern (Elwen *et al.* 2010a, 2010b), as they feed offshore at night. Heaviside's dolphins are resident year round but will only occur well inshore of the Reconnaissance Permit Area.

Figure 44: The dusky dolphin *Lapenorhynchus obscurus* (left) and endemic Heaviside's Dolphin *Cephalorhynchus heavisidii* (right) (Photos: Simon Elwen, Sea Search Research and Conservation).

Bottlenose dolphin: Two species of bottlenose dolphins occur around southern Africa. The smaller Indo-Pacific bottlenose dolphin (*aduncus* form) occurs exclusively to the east of Cape Point in water usually less than 50 m deep and generally within 1 km of the shore (Ross 1984; Ross *et al.* 1987). The larger common bottlenose dolphin (*truncatus* form) is widely distributed in tropical and temperate waters throughout the world, but frequently occur in small (10s to low 100s) isolated coastal populations. An offshore 'form' of common bottlenose dolphins occurs around the coast of southern Africa including Namibia and Angola (Best 2007) with sightings restricted to the continental shelf edge and deeper. Offshore bottlenose dolphins frequently form mixed species groups, often with pilot whales or Risso's dolphins. Encounters in the offshore waters of Reconnaissance Permit Area are likely to be low.

Risso's Dolphin: A medium sized dolphin with a distinctively high level of scarring and a proportionally large dorsal fin and blunt head. Risso's dolphins are distributed worldwide in tropical and temperate seas and show a general preference for shelf edge waters <1 500 m deep (Best 2007; Purdon *et al.* 2020a, 2020b). Many sightings in southern Africa have occurred around the Cape Peninsula and along the shelf edge of the Agulhas Bank. Presence within the inshore portions of the Reconnaissance Permit Area is possible (see Figure 36).

Other Delphinids: Several other species of dolphins that might occur in deeper waters at low levels include the pygmy killer whale, southern right whale dolphin, rough toothed dolphin, pantropical spotted dolphin and striped dolphin. Nothing is known about the population size or density of these species in the project area but encounters are likely to be rare.

Beaked whales: These whales were never targeted commercially and their pelagic distribution makes them the most poorly studied group of cetaceans. They are all considered to be true deep water species usually being seen in waters in excess of 1 000 – 2 000 m deep (see various species accounts in Best 2007). With recorded dives of well over an hour and in excess of 2 km deep, beaked whales are amongst the most extreme divers of any air breathing animals (Tyack *et al.* 2011). All the beaked whales that may be encountered in the project area are pelagic species that tend to occur in small groups usually less than five, although larger aggregations of some species are known (MacLeod & D'Amico 2006; Best 2007). The long, deep dives of beaked whales make them difficult to detect visually, but PAM will increase the probability of detection as animals are frequently echo-locating when on foraging dives. Beaked whales seem to be particularly susceptible to man-made sounds and several strandings and deaths at sea, often *en masse*, have been recorded in association with mid-frequency naval sonar (Cox *et al.* 2006; MacLeod & D'Amico 2006) and a seismic survey for hydrocarbons also running a multi-beam echo-sounder and sub bottom profiler (Southall *et al.* 2008; Cox *et al.* 2006; DeRuiter *et al.* 2013). Although the exact reason that beaked whales seem particularly vulnerable to man-made noise is not yet fully understood, existing evidence suggests that animals change their dive behaviour in response to acoustic disturbance (Tyack *et al.* 2011), showing a fear-response and surfacing too quickly with insufficient time to release nitrogen resulting in a form on decompression sickness. Necropsy of stranded animals has revealed gas embolisms and haemorrhage in the brain, ears and acoustic fat - injuries consistent with decompression sickness (acoustically mediated bubble formation). Beyond decompression sickness, the fear/flee response may be the first stage in a multi-stage process ultimately resulting in stranding. Thus, although hard to detect and avoid – beaked whales are amongst the most sensitive marine mammals to noise exposure and all cautions must be taken to reduce impact. Presence in the project area may fluctuate seasonally, but insufficient data exist to define this clearly. Sightings of beaked whales in the project area are expected to be very low.

5428

All whales and dolphins are given protection under the South African Law. The Marine Living Resources Act, 1998 (No. 18 of 1998) states that no whales or dolphins may be harassed, killed or fished. No vessel or aircraft may, without a permit or exemption, approach closer than 300 m to any whale and a vessel should move to a minimum distance of 300 m from any whales if a whale surfaces closer than 300 m from a vessel or aircraft.

8.4.3.6.3 SEALS

The Cape fur seal (*Arctocephalus pusillus pusillus*) (Figure 45) is the only species of seal resident along the west coast of Africa, occurring at numerous breeding and non-breeding sites on the mainland and on nearshore islands and reefs (see Figure 89). The South African population, which includes the West Coast colonies, was estimated at ca. 725 000 individuals in 2020. This is about 40% of the total southern African population, which has previously been estimated at up to 2 million (Seakamela *et al.* 2022). Vagrant records from four other species of seal more usually associated with the subantarctic environment have also been recorded: southern elephant seal (*Mirounga leonina*), subantarctic fur seal (*Arctocephalus tropicalis*), crabeater (*Lobodon carcinophagus*) and leopard seals (*Hydrurga leptonyx*) (David 1989).

Figure 45: Colony of Cape fur seals *Arctocephalus pusillus pusillus* (Photo: Dirk Heinrich).

There are a number of Cape fur seal colonies within the broader study area: at Bucchu Twins near Alexander Bay, at Cliff Point (~17 km north of Port Nolloth), at Kleinzee (incorporating Robeiland), Strandfontein Point (south of Hondeklipbaai), Paternoster Rocks and Jacobs Reef at Cape Columbine, Vondeling Island, Robbesteen near Koeberg, Seal Island in False Bay and Geyser Rock at Dyer Island, Quoin Point and Seal Island in Mossel Bay. The colony at Kleinzee has the highest seal population and produces the highest seal pup numbers on the South African Coast (Wickens 1994). The colony at Buchu Twins and Cliff Point, formerly non-breeding colonies, have also attained breeding status (M. Meyer, SFRI, pers. comm.). Non-breeding colonies and haul-out sites occur occur at Doringbaai south of Cliff Point, Rooiklippies, Swartduin and Hoep between Kleinzee and Hondeklipbaai, at Spoeg River and Langklip south of Hondeklip Bay, on Bird Island at Lambert's Bay, at Paternostar Point at Cape Columbine and Duikerklip in Hout Bay. These colonies all fall well inshore and to the east of the Reconnaissance Permit Area.

Seals are highly mobile animals with a general foraging area covering the continental shelf up to 120 nautical miles offshore (Shaughnessy 1979), with bulls ranging further out to sea than females. Their diet varies with season and availability and includes pelagic species such as horse mackerel, pilchard, and hake, as well as squid and cuttlefish. Benthic feeding to depths of nearly 200 m for periods of up to 2 minutes has, however, also been recorded (Kirkman *et al.* 2015). Seals are unlikely to be encountered in the offshore waters of the Reconnaissance Permit Area (Figure 46).

The timing of the annual breeding cycle is very regular, occurring between November and January. Breeding success is highly dependent on the local abundance of food, territorial bulls and lactating females being most vulnerable to local fluctuations as they feed in the vicinity of the colonies prior to and after the pupping season (Oosthuizen 1991).

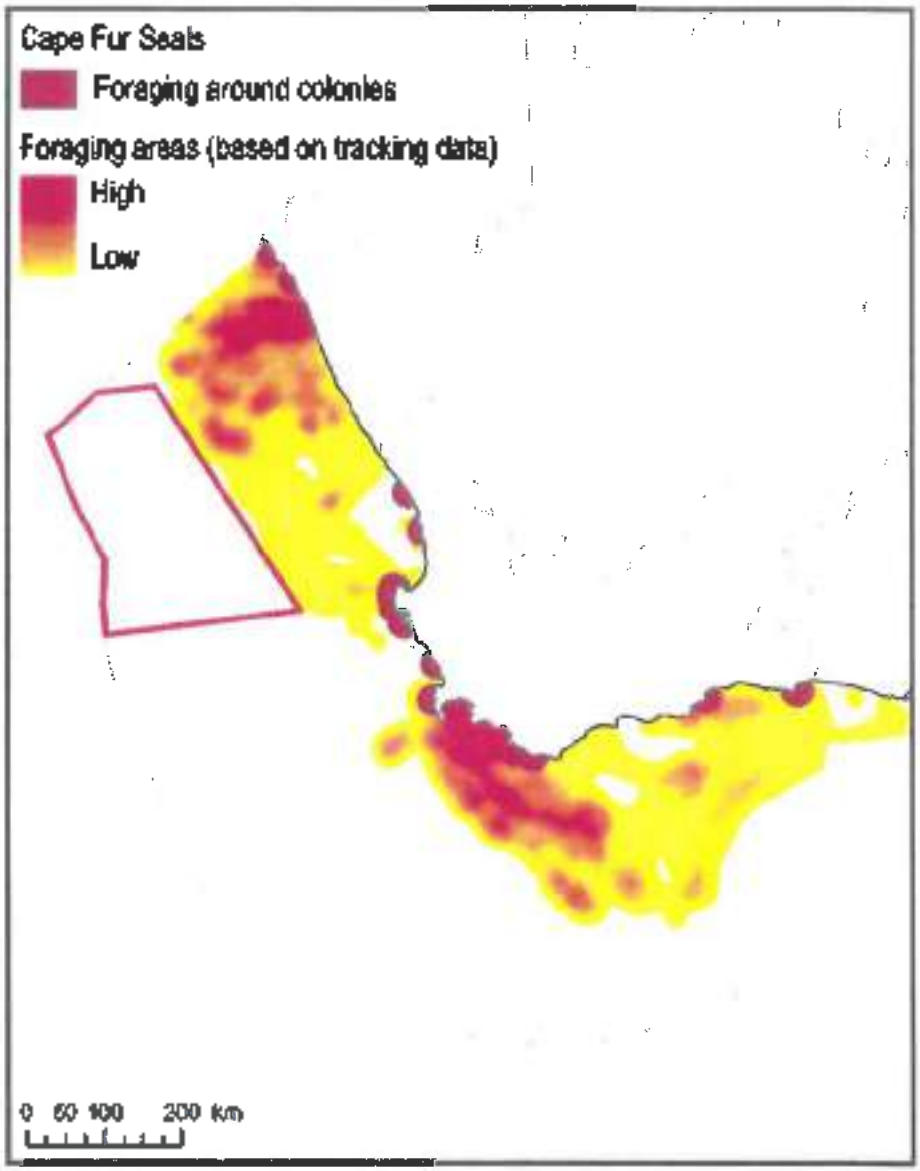

Figure 46: Reconnaissance Permit Area (red polygon) in relation to seal foraging areas on the West and South Coasts. Brown areas are generalised foraging areas around colonies, and areas in shades of red are foraging areas based on tracking data. Darker shades of red indicate areas of higher use.

Historically the Cape fur seal was heavily exploited for its luxurious pelt. Sealing restrictions were first introduced to southern Africa in 1893, and harvesting was controlled until 1990 when it was finally prohibited. The protection of the species has resulted in the recovery of the populations, and numbers continue to increase. Consequently, their conservation status is not regarded as threatened. The Cape Fur Seal population in South Africa is regularly monitored by the Department of Fisheries, Forestry and Environment (DFFE) (e.g. Kirkman *et al.* 2013). The overall population is considered healthy and stable in size, although there has been a westward and northward shift in the distribution of the breeding population (Kirkman *et al.* 2013).

An unprecedented mortality event was recorded in South Africa between September and December 2021 at colonies around the West Coast Peninsula and north to Lambert's Bay and Elands Bay. Primarily pups and juveniles were affected. Post-mortem investigations revealed that seals died in a poor condition with reduced blubber reserves, and protein energy malnutrition was detected for aborted foetuses, for juveniles and

subadults. Although no unusual environmental conditions were identified that may have triggered the die-off, or caused it indirectly (e.g. HABs), 2021 was a year of below average recruitment of anchovy and sardine, the main food source for seals. While a lack of food, as a result of possibly climate change and/or overfishing, has been predicted to be the cause of this mass mortality, the underlying causes of the mortality event remain uncertain (Seakamela et al. 2022).

8.5 FISHERIES

This section provides a description of the fisheries activities of the application area. The information has been sourced from the Fisheries Impact Assessment undertaken by CapeMarine included in Appendix 3.

8.5.1 OVERVIEW OF FISHERIES SECTORS

South Africa has a coastline that spans two ecosystems over a distance of 3623 km, extending from the Orange River in the west on the border with Namibia, to Ponta do Ouro in the east on the Mozambique border. The western coastal shelf has highly productive commercial fisheries similar to other upwelling ecosystems around the world, while the East Coast is considerably less productive but has high species diversity, including both endemic and Indo-Pacific species. South Africa's fisheries are regulated and monitored by the DFFE. All fisheries in South Africa, as well as the processing, sale in and trade of almost all marine resources, are regulated under the Marine Living Resources Act, 1998 (No. 18 of 1998) (MLRA).

Approximately 22 different fisheries sectors currently operate within South African waters. Table 15 lists these along with ports and regions of operation, catch landings and the number of active vessels and rights holders (2017). The proportional volume of catch and economic value of each of these sectors for 2017 is indicated in Figure 47. The primary fisheries in terms of economic value and overall tonnage of landings are the demersal (bottom) trawl and long-line fisheries targeting the Cape hakes (*Merluccius paradoxus* and *M. capensis*) and the pelagic-directed purse-seine fishery targeting pilchard (*Sardinops sagax*), anchovy (*Engraulis encrasicolus*) and red-eye round herring (*Etrumeus whiteheadi*). Highly migratory tuna and tuna-like species are caught on the high seas and seasonally within the South African waters by the pelagic long-line and pole fisheries. Targeted species include albacore (*Thunnus alalunga*), bigeye tuna (*T. obesus*), yellowfin tuna (*T. albacares*) and swordfish (*Xiphias gladius*). The traditional line fishery targets a large assemblage of species close to shore including snoek (*Thyrsites atun*), Cape bream (*Pachymetopon blochii*), geelbek (*Atractoscion aequidens*), kob (*Argyrosomus japonicus*), yellowtail (*Seriola lalandi*) and other reef fish. Crustacean fisheries comprise a trap and hoop net fishery targeting West Coast rock lobster (*Jasus lalandii*), a line trap fishery targeting the South Coast rock lobster (*Palinurus gilchristi*) and a trawl fishery based solely on the East Coast targeting penaeid prawns, langoustines (*Metanephrops andamanicus* and *Nephropsis stewarti*), deep-water rock lobster (*Palinurus delagoae*) and red crab (*Chaceon macphersoni*). Other fisheries include a mid-water trawl fishery targeting horse mackerel (*Trachurus trachurus capensis*) predominantly on the Agulhas Bank (South Coast) and a hand-jig fishery targeting chokka squid (*Loligo vulgaris reynaudii*) exclusively on the South Coast. In addition to commercial sectors, recreational fishing occurs along the coastline comprising shore angling and small, open boats generally less than 10 m in length. The commercial and recreational fisheries are reported to catch over 250 marine species, although fewer than 5% of these are actively targeted by commercial fisheries, which comprise 90% of the landed catch.

Most commercial fish landings must take place at designated fishing harbours. For the larger industrial vessels targeting hake, only the major ports of Saldanha Bay, Cape Town, Mossel Bay and Port Elizabeth are used. On the West Coast, St. Helena Bay and Saldanha Bay are the main landing sites for the small pelagic fleets. These ports also have significant infrastructure for the processing of anchovy into fishmeal as well as the canning of sardine. Smaller fishing harbours on the West / South-West Coast include Port Nolloth, Hondeklip, Doringbaai, Lamberts Bay, Hout Bay and Gansbaai harbours. On the East Coast, Durban and Richards Bay are deployment ports for the crustacean trawl and large pelagic longline sectors. There are more than 230 small-scale fishing communities on the South African coastline (DAFF, 2016). Small-scale fisheries operate in the nearshore environment. Recreational fisheries comprise shore-based, estuarine and boat-based line fisheries as well as spearfishing and net fisheries, including cast, drag and hoop net techniques.

8.5.2 SPAWNING AND RECRUITMENT OF FISH STOCKS

The South African coastline is dominated by seasonally variable and sometimes strong currents, and most species have evolved selective reproductive patterns to ensure that eggs and larvae can enter suitable nursery grounds situated along the coastline. Three nursery grounds can be identified in South African waters, viz the Natal Bight; the Agulhas Bank and the inshore Western Cape coasts. Each is linked to a spawning area, a transport and/or recirculation mechanism, a potential for deleterious offshore or alongshore transport and an enriched productive area of coastal or shelf-edge upwelling (Hutchings *et al.*, 2002).

Hake, sardines, anchovy and horse mackerel are mostly serial, broadcast spawners, producing large numbers of eggs sporadically that are widely dispersed in ocean currents (Hutchings *et al.*, 2002). The principal commercial fish species undergo a critical migration pattern in the Agulhas and Benguela ecosystems. Adults spawn on the Agulhas Bank between the shelf-edge upwelling and the cold-water ridge, where copepod availability is highest (Crawford 1980; Hutchings 1994; Roel & Armstrong 1991; Hutchings *et al.* 2002). The spawn products are thought to move southwards from the central Agulhas Bank and then may drift northwards in the Benguela current across the shelf and up the west coast, or inshore and eastwards towards the south coast. As the eggs drift, hatching takes place followed by larval development. Settlement of larvae occurs in the inshore areas, in particular the bays that are used as nurseries, from October to March. In the southern Benguela system, juveniles shoal and then begin a southward migration down the west coast – it is at this stage that anchovy and sardine are targeted by the small pelagic purse seine fishery. Juveniles of demersal species such as hake are thought to move from a pelagic phase and to systematically migrate to the seafloor (a vertical migration) and then as they mature and grow in size, move offshore into deeper water where they are targeted by commercial fisheries (in hake this occurs in their third year of growth and is referred to as "recruiting" to the fishery).

Spawning of key species exploited by commercial fishery sectors off the West Coast are presented below (Hutchings *et al.* 2002):

- Hake, snoek and round herring move to the western Agulhas Bank and southern west coast to spawn during key periods (late winter to early spring), when losses due to offshore drift are at a minimum and eggs and larvae drift northwards and inshore to the west coast nursery grounds.

- Hake are serial spawners and are reported to spawn throughout the year with peaks in October/November and March/April (Johann Augustyn, SADSTIA and Dave Japp, CapMarine pers com.). During these periods there is a greater concentration of drifting eggs and larvae compared to other months. Spawning of the shallow-water hake occurs primarily over the shelf (<200 m) whereas that by the deep-water hake occurs off the shelf.
- Horse mackerel spawn over the east/central Agulhas Bank during winter months but are also concentrated on the eastern part of the bank most months in feeding aggregations. Juveniles occur close inshore off the southern Cape coastline and west coast nursery habitats.
- Anchovies are known to spawn on the western, central and eastern Agulhas Bank, from October to March with spawning peaking during October to January (van der Lingen and Huggett, 2003) and some shifts to the west coast in years when Agulhas Bank water intrudes strongly north of Cape Point (van der Lingen *et al.*, 2001 in Hutchings *et al.*, 2002).
- Genomic and transcriptomic analyses have shown that there are two stocks of sardine off South Africa; the Cool Temperate Sardine (CTS) off the west coast and Warm Temperate Sardine (WTS) off the south coast, with some mixing (in both directions) between the two (Teske *et al.* 2021). Sardines spawn on the western, central and eastern Agulhas Bank, and also off the west coast north of Cape Point. Sardine eggs are found throughout the year, but spawning occurs from August to February (spring-summer) for the CTS off the west coast, and from June to November (winter-spring) for WTS off the south coast. There is an intense seasonal movement of sardine eastwards (the "sardine run") that occurs in mid-winter and which is associated with westerly frontal systems driving fish inshore in counter currents. And whilst sardine eggs are found off the east coast from June to December (see Connell 2010 AJMS 32(2)), the KwaZulu-Natal sardine run is not the spawning migration of a third stock but a navigation error by CTS.
- Squid (*Loligo spp.*) spawn in the nearshore zone on the eastern Agulhas Bank, principally in shallow waters (<50 m) between Knysna and Gqeberha. Their distribution and abundance are erratic and linked to temperature, turbidity, and currents (Augustyn *et al.* 1994; Schön *et al.* 2002). This niche area on the eastern Agulhas Bank optimises their spawning and early life stage as nowhere else on the shelf are both bottom temperature and bottom dissolved oxygen simultaneously at optimal levels for egg development (Roberts 2005; Oosthuizen & Roberts 2009). The greatest concentration of their food (copepods) tends to be found further west in the cold-water ridge on the central Agulhas Bank (Roberts & van den Berg 2002). Squid are not broadcast spawners but instead they lay benthic egg sacs. The paralarvae that hatch from the sacs are distributed close inshore and juveniles are dispersed over the entire shelf region of the Agulhas Bank. Larvae and juveniles are carried offshore and westwards (via the Benguela Jet) to feed and mature, before returning to the spawning grounds to complete their lifecycle (Olyott *et al.* 2007).
- Snoek spawning occurs offshore during winter-spring (June to October), along the shelf break (150–400 m) of the western Agulhas Bank and the South African west coast. Prevailing currents transport eggs and larvae to a primary nursery ground north of Cape Columbine and to a secondary nursery area to the east of Danger Point; both shallower than 150 m. Juveniles remain on the nursery grounds until maturity, growing to between 33 and 44 cm in the first year (3.25 cm/month). Onshore-offshore distribution (between 5- and 150-m isobaths) of juveniles is determined largely by prey availability and includes a seasonal inshore migration in autumn in response to clupeoid recruitment. Adults are found throughout the distribution range of the species, and although they move offshore to spawn - there is some southward dispersion as the spawning season progresses - longshore movement is apparently random and without a seasonal basis (Griffiths, 2002; refer to Figure 48).
- The inshore area of the Agulhas Bank, especially between the cool water ridge and the shore, serves as an important nursery area for numerous linefish species (e.g. elf *Pomatomus saltatrix*, leervis *Lichia amia*, geelbek *Atractoscion aequidens*, carpenter *Argyrozona argyrozona*) (Wallace *et al.* 1984; Smale *et al.* 1994). A significant proportion of these eggs and larvae originate from spawning grounds along the east coast, as adults undertake spawning migrations along the South Coast into KwaZulu-Natal

waters (van der Elst 1976, 1981; Griffiths 1997; Garratt 1988; Beckley & van Ballegooyen 1992). The eggs and larvae are subsequently dispersed southwards by the Agulhas Current, with juveniles occurring on the inshore Agulhas Bank, using the area between the cold-water ridge and the shore as nursery grounds (van der Elst 1976, 1981; Garratt 1988). In the case of the carpenter, a high proportion of the reproductive output comes from the central Agulhas Bank and the Tsitsikamma Marine Protected Area (MPA), and two separate nursery grounds appear to exist, one near Gqeberha and a second off the deep reefs off Cape Agulhas, with older fish spreading eastwards and westwards (van der Lingen et al. 2006).

Table 17 shows known spawning periods of key commercial species off the West Coast of South Africa.

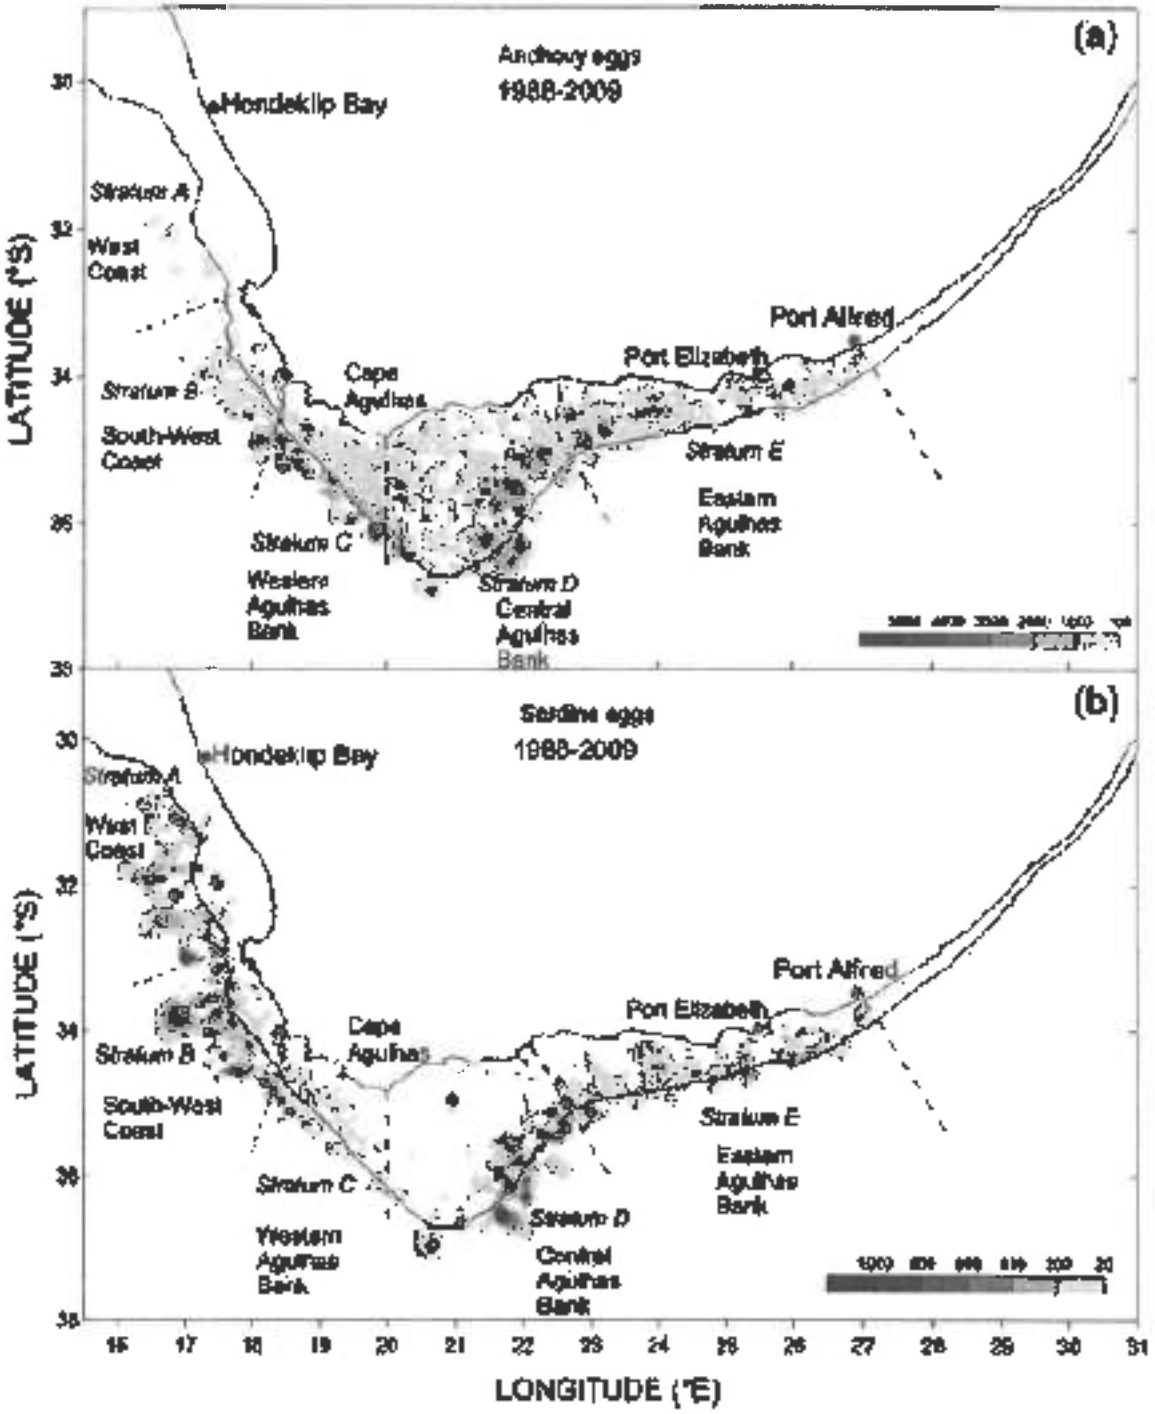

Figure 50: Composite distribution maps for eggs (eggs.m-2) of (a) anchovy and (b) sardine collected during spawner biomass surveys by DFFE over the period 1988–2009 (Mhlongo *et al.*, 2015).

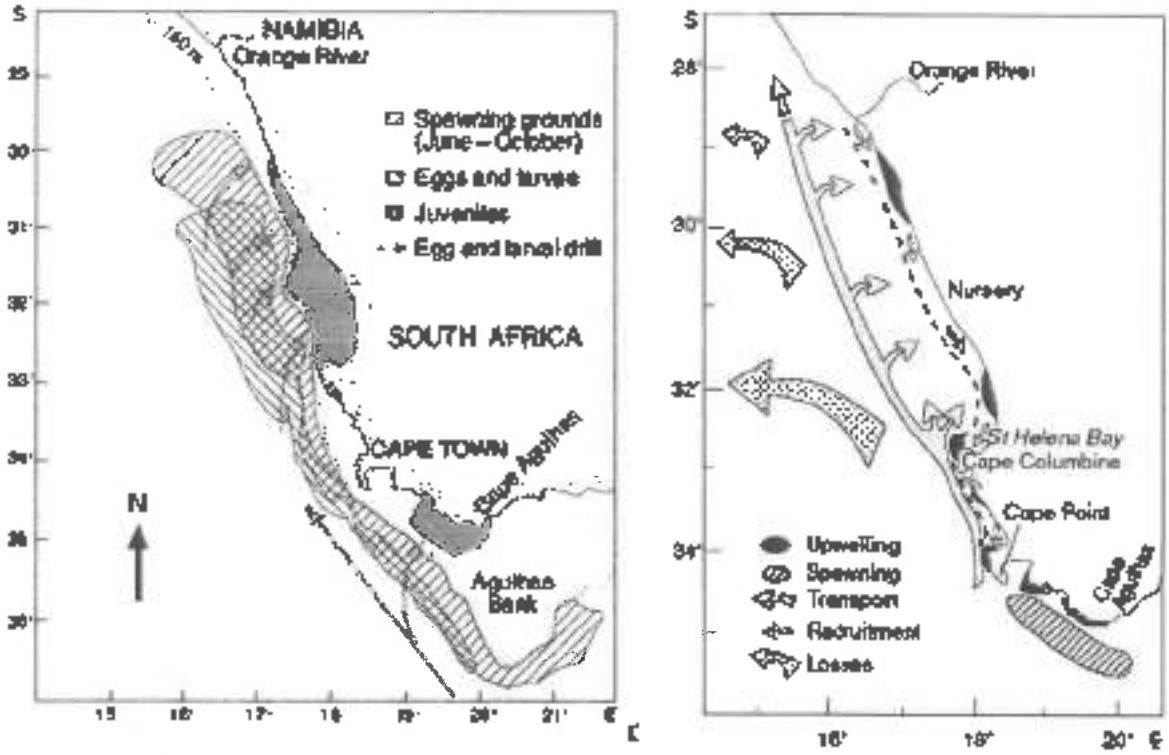

Figure 51: Conceptual model depicting the life history of snoek (left; Source: Griffiths, 2002) and anchovy (right; Hutchings *et al.*, 1992) in the southern Benguela ecosystem, including spawning grounds, distribution and transport of eggs and larvae, and the nursery areas.

8.5.3 COMMERCIAL FISHING SECTORS

8.5.3.1 DEMERSAL TRAWL

The primary fisheries in terms of highest economic value are the demersal (bottom) trawl and longline fisheries targeting the Cape hakes (*Merluccius paradoxus* and *M. capensis*). Secondary species include a large assemblage of demersal fish of which monkfish (*Lophius vomerinus*), kingklip (*Genypterus capensis*) and snoek (*Thyrsites atun*) are the most commercially important. The demersal trawl fishery comprises an offshore (deep-sea) and inshore fleet, which differ primarily in terms of vessel capacity and the areas in which they operate. The wholesale value of catch landed by the inshore and offshore demersal trawl sectors, combined, during 2017 was R5.982 Billion, or 40.5% of the total value of all fisheries combined. The 2022 total allowable catch (TAC) for hake is set at 132 154 tons, of which 84% and 6% is allocated to the offshore and inshore trawl sectors, respectively (The remaining 10% is allocated to the hake demersal longline sector – refer to Section 8.5.3.3).

The annual TAC limits and landings of hake (both species) by the trawl and longline sectors is listed in Table 18. A time-series of total hake catch as well as hake catch by sector is shown in Figure 52.

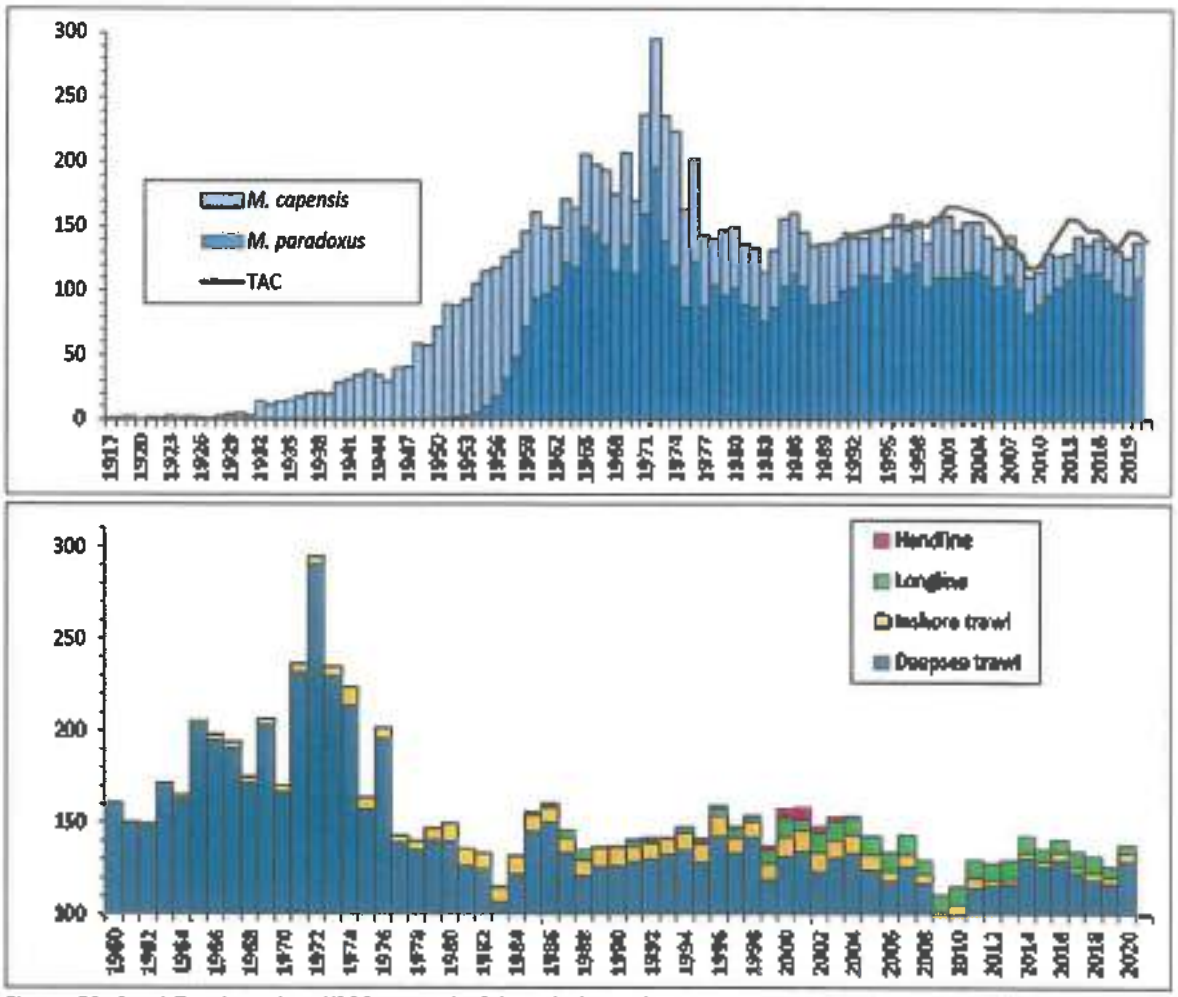

Figure 52: (top) Total catches ('000 tonnes) of Cape hakes split by species over the period 1917–2020 and the TAC set each year since the 1991. (bottom) Catches of Cape hakes per fishing sector for the period 1960–2020. Prior to 1960, all catches are attributed to the deep-sea trawl sector. Note that the vertical axis commences at 100 000 tonnes to better clarify the contributions by each sector. (Source DEFF, 2022)

Table 18: Annual total allowable catch (TAC) limits and catches (tons) of the two species of hake by the hake-directed fisheries on the West (WC) and South (SC) coasts (Adapted from DEFF, 2020[3]).

The offshore fishery is comprised of 45 vessels operating from most major harbours on both the West and South Coasts. On the West and South-West Coasts, these grounds extend in a continuous band along the shelf edge approximately between the 200 m and 1 000 m bathymetric contours although most effort is in the >300 m to 600 m depth range. Monkfish-directed trawlers tend to fish shallower waters than hake-directed vessels on mostly muddy substrates. Trawl nets are generally towed parallel to the depth contours (thereby maintaining a relatively constant depth) in a north-westerly or south-easterly direction. Trawlers also target fish aggregations around bathymetric features, in particular seamounts and canyons, where there is an increase in seafloor slope and in these cases the direction of trawls follow the depth contours. The deep-sea sector is prohibited from operating in waters shallower than 110 m or within five nautical miles of the coastline. Fishing activity occurs year-round.

The inshore fishery consists of 31 vessels, which operate on the South Coast mainly from the harbours of Mossel Bay and Port Elizabeth. Inshore grounds are located on the Agulhas Bank and extend towards the Great Kei River in the east. Vessels also target sole close inshore between Struisbaai and Mossel Bay, between the 50 m and 80 m isobaths. Hake is targeted further offshore in traditional grounds between 100 m and 200 m depth in fishing grounds known as the Blues located on the Agulhas Bank.

Otter trawling is the main trawling method used in the South African hake fishery. This method of trawling makes use of trawl doors (also known as otter boards) that are dragged along the seafloor ahead of the net, maintaining the horizontal net opening. Bottom contact is made by the footrope and by long cables and bridles between the doors and the footrope. Behind the trawl doors are bridles connecting the doors to the wings of the net (to the ends of the footrope and headrope). A headline, bearing floats and the weighted footrope (that may include rope, steel wire, chains, rubber discs, spacers, bobbins or weights) maintain the vertical net opening. The "belly", "wings" and the "cod-end" (the part of the net that retains the catch) may contact the seabed (see Figure 53). The configuration of trawling gear is similar for both offshore and inshore vessels however inshore vessels are smaller and less powerful than those operating within the offshore sector. The offshore fleet is segregated into wetfish and freezer vessels which differ in terms of the capacity for the processing of fish at sea and in terms of vessel size and capacity. While freezer vessels may work in an area for up to a month at a time, wetfish vessels may only remain in an area for about a week before returning to port. Wetfish vessels range between 24 m and 56 m in length while freezer vessels are usually larger, ranging up to 90 m in length. Inshore vessels range in length from 15 m to 40 m. Trips average three to five days in length and all catch is stored on ice.

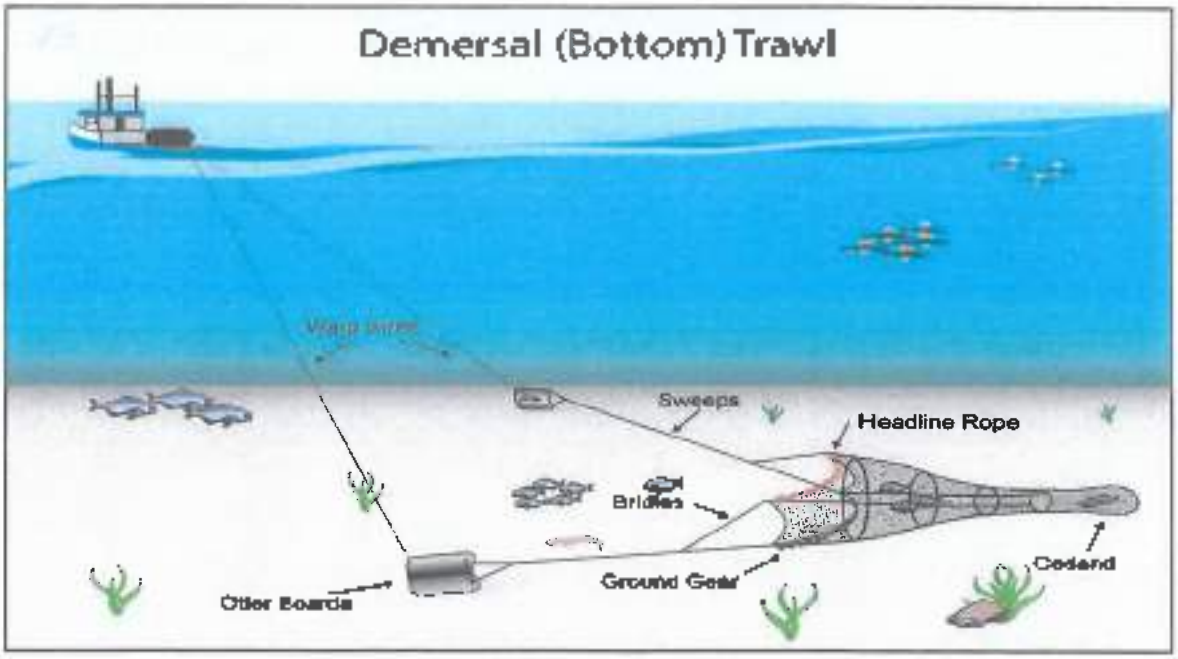

Figure 53: Typical gear configuration used by offshore demersal trawlers targeting hake (Source: www.afma.gov.au/fisheries-management/methods-and-gear/trawling).

The activity of the fishery is restricted by permit condition to operating within the confines of a historical "footprint" – an area of approximately 57 300 km² and 17 000 km² for the offshore and inshore fleets, respectively. Offshore trawlers operate along the west coast along the shelf break between approximately Hondeklipbaai and the southern tip of the Agulhas Bank between the 200 m and 750 m bathymetric contours, with sporadic trawls to a maximum depth of 900 m. The Reconnaissance Permit extends offshore of fishing grounds referred to as the "North Grounds" (Sink et. al, 2012). These grounds are characterised by sandy and muddy sand, with isolated patches of hard ground. The area has been trawled since the 1990's commencing on shallower grounds and with effort extending into deeper waters with the advancement of fishing technologies over time.

At it's closest point the demersal trawl footprint is situated approximately 5 km offshore of the area fished around the slopes of the submarine feature Childs Bank (referred to by the fishing industry as the "karbonkel") off Hondeklipbaai. The demersal trawl footprint is situated at least 10 km inshore of the eastern extent of the Reconnaissance Permit area towards the productive fishing grounds between Lamberts Bay and Saldanha Bay. Figure 54 shows the demersal trawling footprint and recent effort off the west coast of South Africa and in relation to the Reconnaissance Permit application area.

Je28

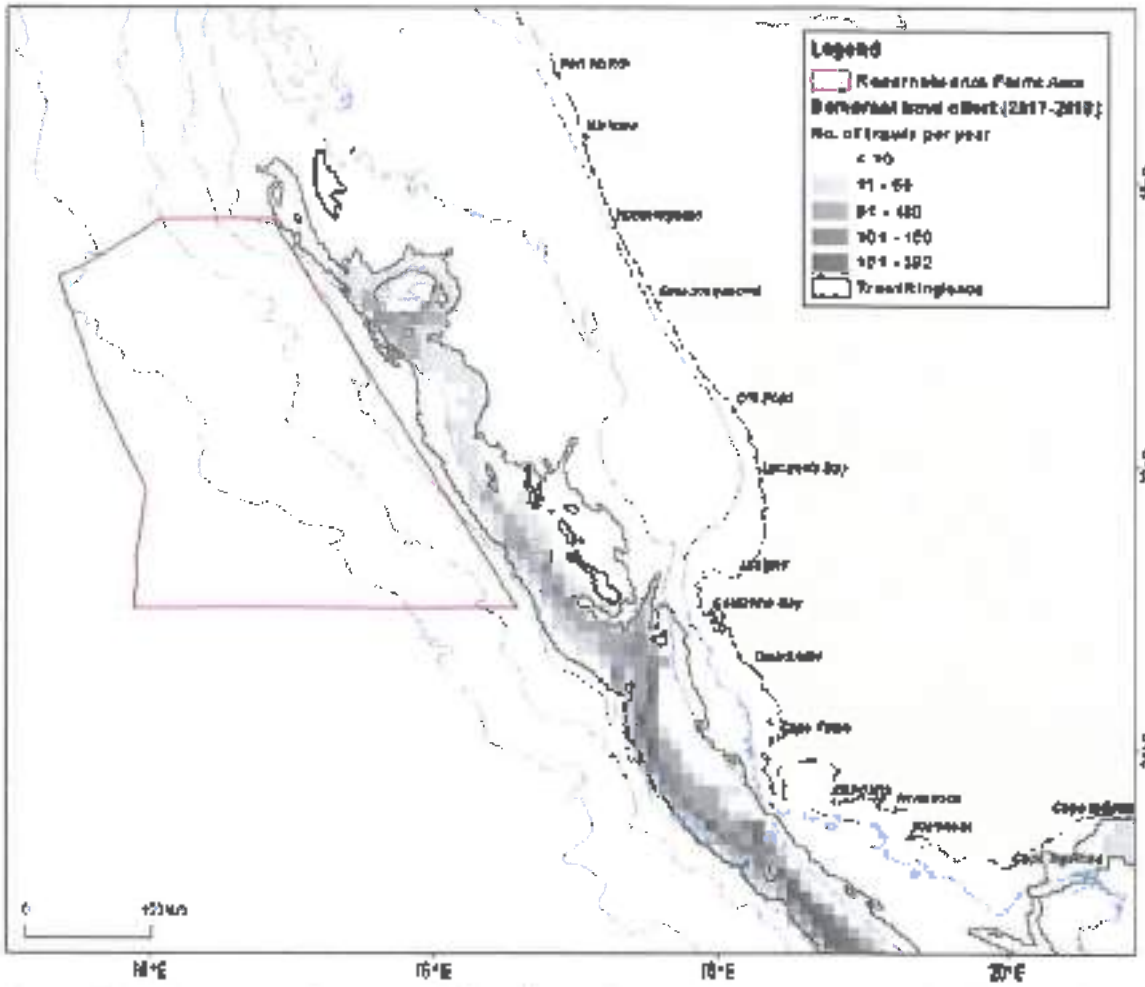

Figure S4: Overview of the trawl ringfence and the spatial distribution of fishing effort expended by the demersal trawl sector in relation the Reconnaissance Permit application area.

8.5.3.2 **MIDWATER TRAWL**

The midwater trawl fishery targets adult Cape horse mackerel (*Trachurus capensis*), which aggregate in highest concentration on the Agulhas Bank. Cape horse mackerel are semi-pelagic shoaling fish that occur on the continental shelf off southern Africa from southern Angola to the Wild Coast. Off South Africa, adult horse mackerel are currently more abundant off the South Coast than the West Coast. Horse mackerel yield a low-value product and are a source of cheap protein (DEFF, 2020).

This sector comprises six vessels and 34 rights holders which landed a total catch of 19 555 in 2019. Refer to Figure S5 for the catches and TACs for the midwater trawl fishery between 1998 and 2018. The fleet is split between dual rights holders who fish horse mackerel on hake-directed trawlers and others that combine their allocation on a single large midwater trawl vessel (the MFV Desert Diamond). Dual rights holders fishing only occurs if horse mackerel availability is high when fishing for hake at which point that may switch from bottom trawl to midwater trawl. The amounts of horse mackerel caught by these vessels is a relatively small component of the horse mackerel TAC. Those horse mackerel rights holders that do not have hake rights or who do not have a suitable vessel to catch horse mackerel allow their share of the horse mackerel to be caught on a single large midwater trawler. This facilitates the economic use of a single large vessel that can more efficiently catch their horse mackerel allowing the vessels to fish year round. The area fished by this vessel is restricted largely (but not exclusively) to water deeper than 110 m or more than 20 nm from the coast and in an area east of Cape Point. The dual vessels may fish in a broader area, mostly on or near the hake fishing grounds.

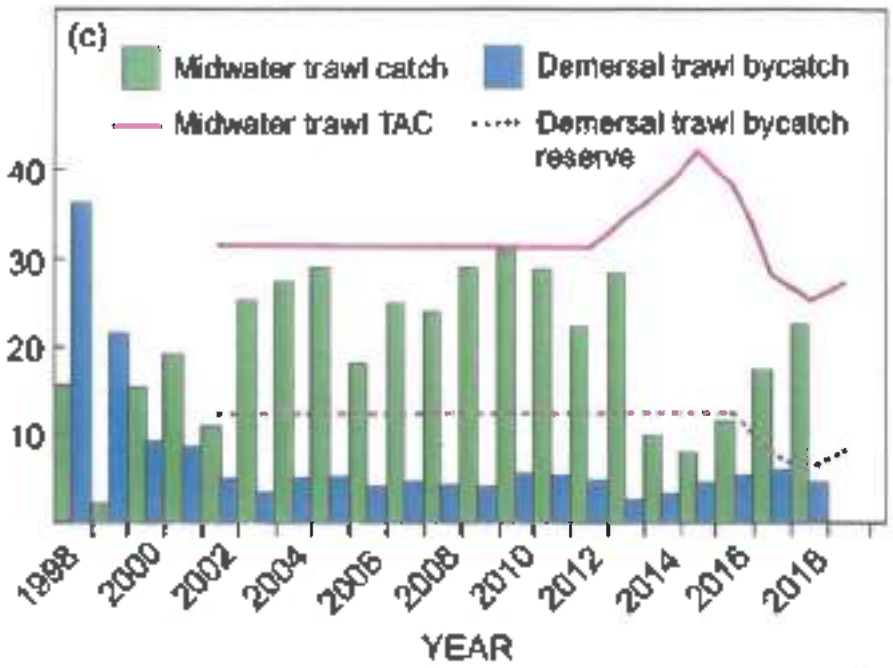

Figure 55: Trawl catches (tons, 1998 – 2018) split into the demersal and midwater trawl components. The midwater trawl TAC (solid line) and demersal trawl bycatch reserve (dashed line) are also shown (Source: DEFF, 2020).

Midwater trawl is defined in the Marine Living Resources Act (No. 18 of 1998) (MLRA) as any net which can be dragged by a fishing vessel along any depth between the seabed and the surface of the sea without continuously touching the bottom. In practice, midwater trawl gear does occasionally come into contact with the seafloor. Midwater trawling gear configuration is similar to that of demersal trawlers, except that the net is manoeuvred vertically through the water column (refer to Figure 56 for a schematic diagram of gear configuration). The towed gear may extend up to 1 km astern of the vessel and comprises trawl warps, net and cod end. Trawl warps are between 32 mm and 38 mm in diameter. The trawl doors (3.5 t each) maintain the net opening which ranges from 120 to 130 m in width and from 40 m to 80 m in height. Weights in front of, and along the ground-rope provide for vertical opening of the trawl. The cable transmitting acoustic signal from the net sounder might also provide a lifting force that maximizes the vertical trawl opening. To reduce the resistance of the gear and achieve a large opening, the front part of the trawls are usually made from very large rhombic or hexagonal meshes. The use of nearly parallel ropes instead of meshes in the front part is also a common design. Once the gear is deployed, the net is towed for several hours at a speed of 4.8 to 6.8 knots predominantly parallel with the shelf break.

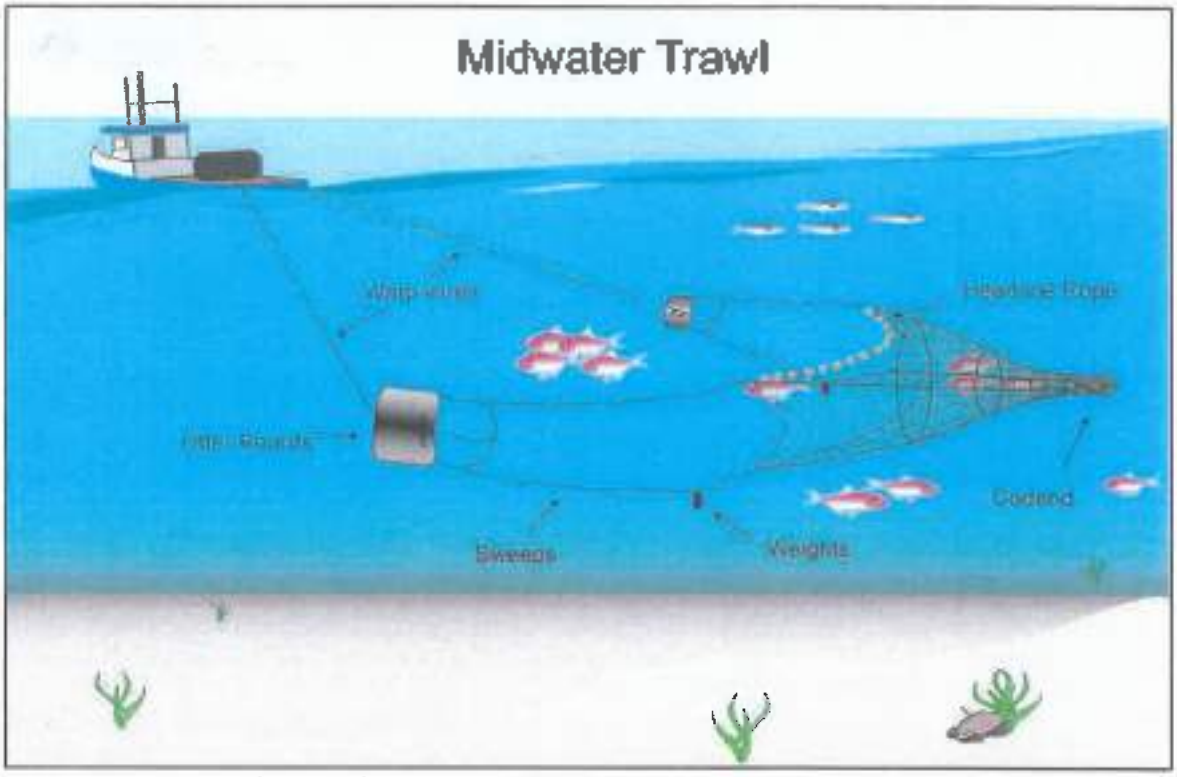

Figure 56: Schematic diagram showing the typical gear configuration of a midwater trawler. Source: www.afma.gov.au/fisheries-management/methods-and-gear/trawling

The fishery operates predominantly on the edge of the Agulhas Bank, where shoals are found in commercial abundance. Fishing grounds off the South Coast are situated along the shelf break and three dominant areas can be defined. The first lies between 22 °E and 23 °E at a distance of approximately 70 nm offshore from Mossel Bay and the second extends from 24 °E to 27 °E at a distance of approximately 80 nm offshore. The third area lies to the south of the Agulhas Bank 21 °E and 22 °E. These grounds range in depth from 100 m to 400 m and isolated trawls are occasionally recorded up to 650 m. Since 2017, DFFE has permitted experimental fishing to take place westward of 20°E.

Figure 57 shows the spatial extent of midwater trawls undertaken between 2017 and 2019 in relation to the Reconnaissance Permit application area. Sector activity off the West Coast takes place predominantly south of Cape Town at a depth range of between 120 m and 580 m. There is no overlap between midwater trawl grounds and the Reconnaissance Permit application area which is situated at least 30 km from the closest fishing location and 150 km from the main fishing areas.

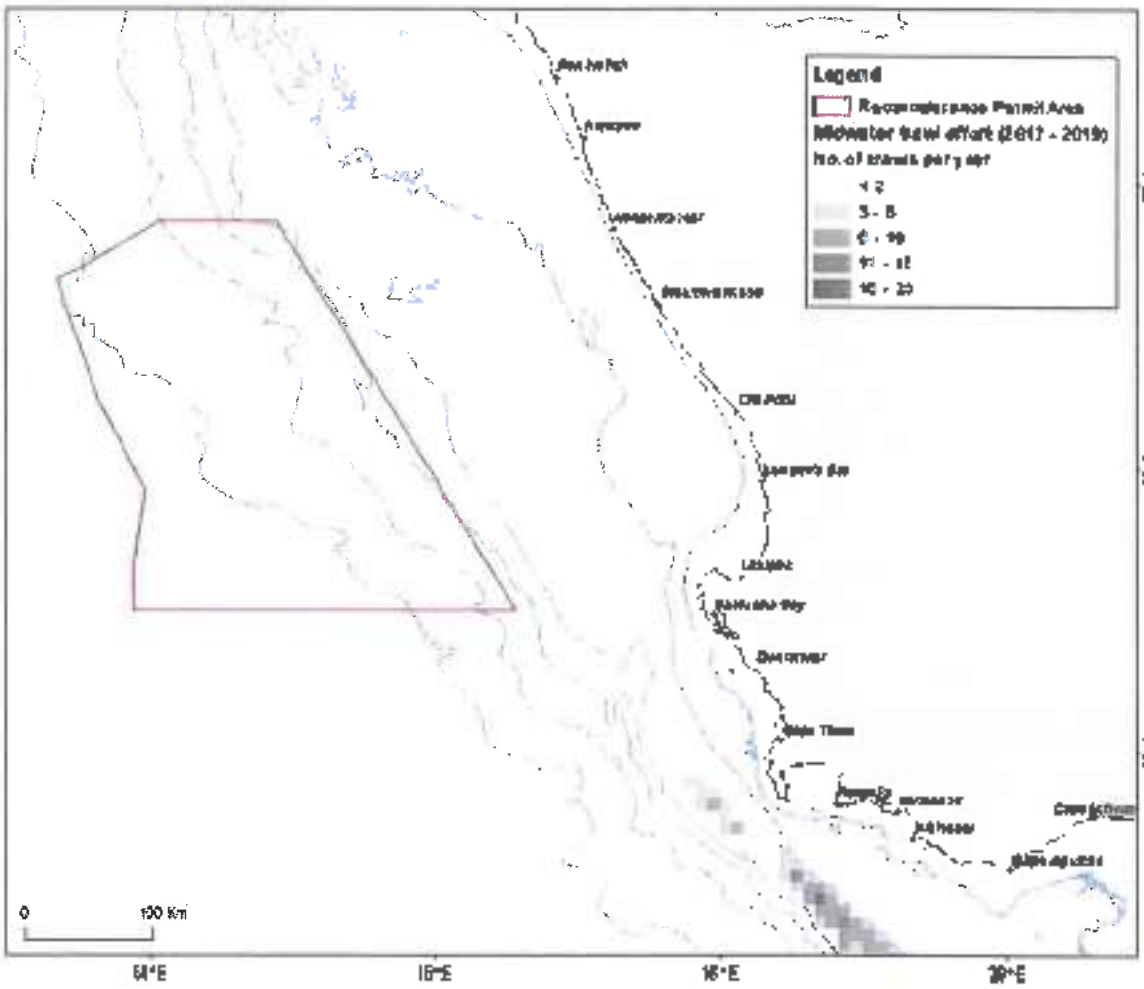

Figure 57: DFFE's catch reporting grid system and the spatial distribution of fishing effort expended by the midwater trawl sector in relation to the Reconnaissance Permit application area.

8.5.3.3 DEMERSAL HAKE LONGLINE

Like the demersal trawl fishery, the target species of the longline fishery is the Cape hakes, with a small non-targeted commercial by-catch that includes kingklip. In 2017, 8113 tons of catch was landed with a wholesale value of R319.2 million, or 9.2% of the total value of all fisheries combined. Landings of 8 230 tons were reported in 2018.

A demersal longline vessel may deploy either a double or single line which is weighted along its length to keep it close to the seafloor. Steel anchors, of 40 kg to 60 kg, are placed at the ends of each line to anchor it, and are marked with an array of floats. If a double line system is used, top and bottom lines are connected by means of dropper lines. Since the top-line (polyethylene, 10 – 16 mm diameter) is more buoyant than the bottom line, it is raised off the seafloor and minimizes the risk of snagging or fouling. The purpose of the top-line is to aid in gear retrieval if the bottom line breaks at any point along the length of the line. Lines are typically between 10 km and 20 km in length, carrying between 6 900 and 15 600 hooks each. Baited hooks are attached to the bottom line at regular intervals (1 to 1.5 m) by means of a snood. Gear is usually set at night at a speed of between five and nine knots. Once deployed the line is left to soak for up to eight hours before it is retrieved. A line hauler is used to retrieve gear (at a speed of approximately one knot) and can take six to ten hours to complete. A schematic representation of the gear configuration used by the demersal longline fleet is shown in Figure 58.

Currently 64 hake-directed vessels are active within the fishery, most of which operate from the harbours of Cape Town and Hout Bay. Fishing grounds are similar to those targeted by the hake-directed trawl fleet. The hake longline footprint extends down the west coast from approximately 150 km offshore of Port Nolloth (15°E, 29°S). It lies inshore to the south of St Helena Bay moving offshore once again as it skirts the Agulhas Bank to the south of the country (21°E, 37°S). Along the South Coast the footprint moves inshore again towards Mossel

Bay. The eastern extent of the footprint lies at approximately (26°E, 34.5°S). Lines are set parallel to bathymetric contours, along the shelf edge up to the 1 000 m depth contour in places. The more patchy nature of effort in the north western extents of the footprint and the eastern edge of the Agulhas Bank may be attributed to proximity to fishing harbours. Fishing activity within the area occurs year-round with slightly lower levels during winter.

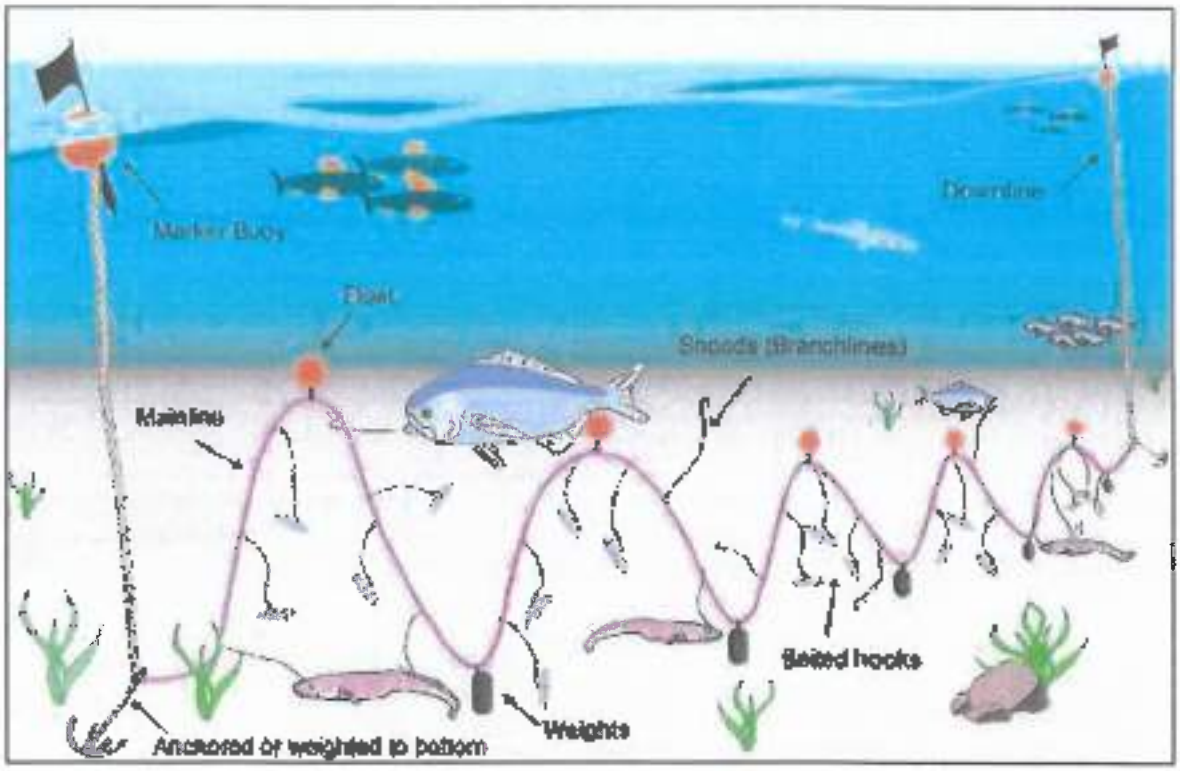

Figure 58: Typical configuration of demersal longline gear used in the South African hake-directed fishery.

Figure 59 shows the spatial distribution of demersal longline fishing areas in relation to the Reconnaissance Permit application area. Fishing effort takes place between the 100 m and 750 m bathymetric contours, but the majority of effort takes place within the depth range 200 m to 650 m. There is no overlap between demersal hake-directed longline grounds and the Reconnaissance Permit application area, which is situated approximately 12 km offshore of the closest fishing locations.

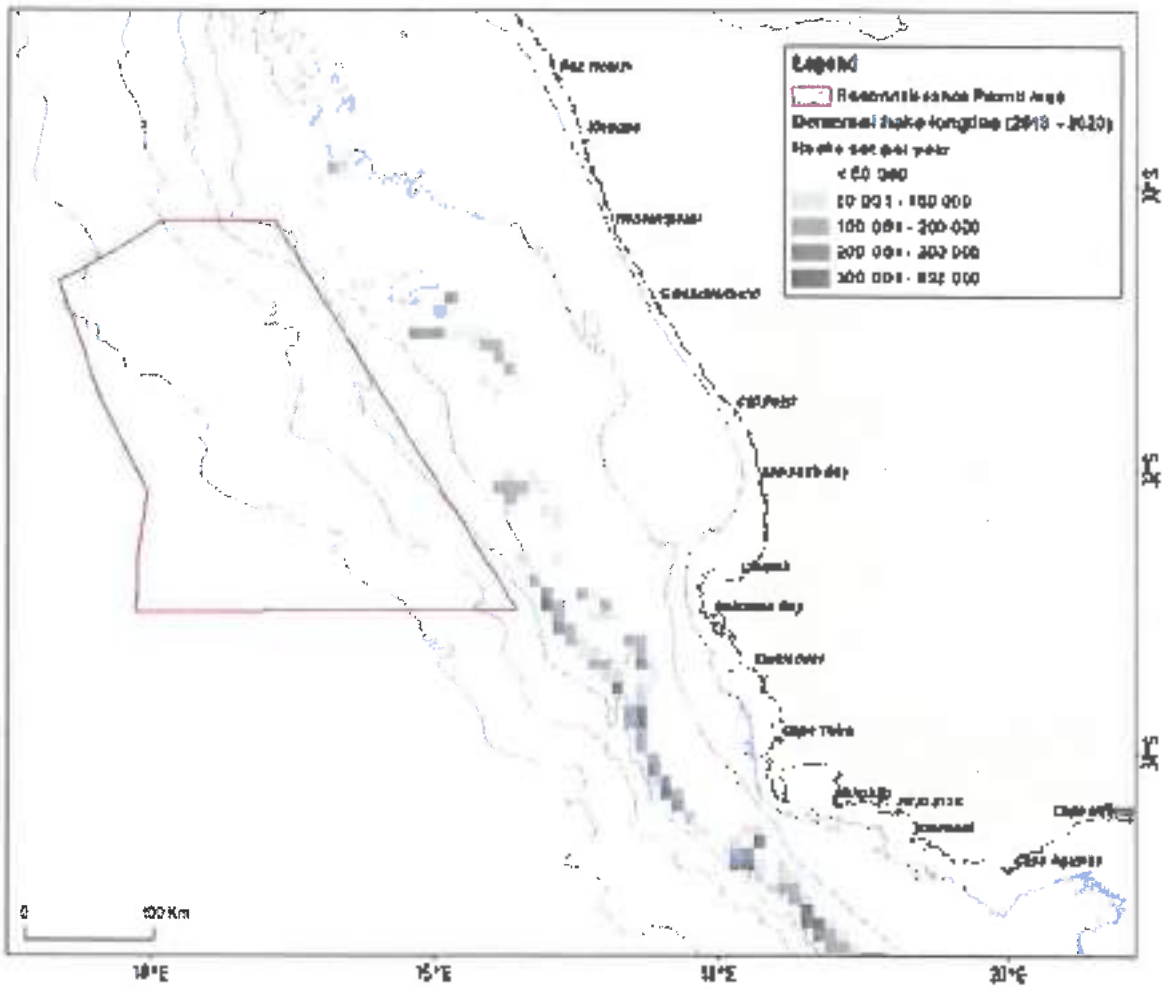

Figure 59: Spatial distribution of fishing effort expended by the hake-directed demersal longline sector in relation to the Reconnaissance Permit application area.

8.5.3.4 DEMERSAL SHARK LONGLINE

The shark longline sector formally commenced in 1991 when 30 permits were issued initially to target both demersal and pelagic sharks (pelagic sharks are those living in the water column, often occurring further offshore). In 2005 the dual targeting of demersal and pelagic sharks under the same permit was discontinued and the sector became an exclusive demersal shark longline fishery reduced to eleven Right Holders in 2004 and just six in 2006. The demersal shark longline fishery is permitted to operate in coastal waters from the Orange River on the West Coast to the Kei River on the East Coast, but fishing rarely takes place north of Table Bay. Vessels are typically <30 m in length and use nylon monofilament Lindgren Pitman spool-systems to set weighted longlines baited with up to 2 000 hooks (average = 917 hooks). The fishery operates in waters generally shallower than 100 m, and uses bottom-set gear to target predominantly soupfin sharks and smoothhound sharks. Following an initial period of adjustment to catching and marketing demersal sharks, catches of soupfin and smoothhound sharks started increasing in 2006, and reporting became more reliable. As the majority of Right Holders own additional rights in other fisheries, the number of active vessels fluctuates over the year but rarely exceeds four vessels operating at the same time. Annual landings have fluctuated widely due to variation in demand and price. Rights are due to be re-allocated during the fishing rights allocation process in 2021/2022.

The commercial-scale exploitation of sharks began in the 1930s around traditional fishing villages in the Western Cape. This fishery used handlines and targeted inshore demersal sharks for their livers to be used in the production of Vitamin A oil. By the 1940s, catches of soupfin sharks had declined (Davies 1964) as targeting shifted. To date, this Western Cape soupfin fishery has not recovered to historical catch levels. To compensate for declining catch rates of high-value line fish species, a rapid increase was seen in shark catches between 1990 and 1993. After 2000, species-specific reporting came into effect and sharks continued to constitute a large

proportion of the livelihood of these fishers around South Africa, with the establishment of a number of dedicated shark processing facilities. Shark catches by the line fishery since the 1990s have typically fluctuated in response to the availability of higher priced line fish species and market influences. Species targeted include soupfin sharks, smoothhound sharks, dusky sharks Carcharhinus obscurus, bronze whaler sharks C. brachyurus, and various skate species. Table 19 lists 2018 landings of the main demersal shark and skate species caught by line.

Table 19: Total catches per FAO area of demersal shark (2018).

Species	Catch by FAO Area (kg)			Total
	1.6	2.1	2.2	
Soupfin shark	7	2017	365	2388
Smoothhound shark	6	4244	5940	9591
Bronze shark	6	384	0	390
St. Joseph shark	0	112	33	144
Skate	0	145	444	589
Total	19	6902	6183	13103

Figure 60 shows the spatial distribution of shark-directed demersal longline catch between 2017 and 2019 in relation to the Reconnaissance Permit application area. Recent fishing activity shows effort occurs East of Cape Point, inshore of the 100 m depth contour and at least 250 km SE of the Reconnaissance Permit area at closest point. There is no overlap of the demersal longline sector with the Reconnaissance Permit area.

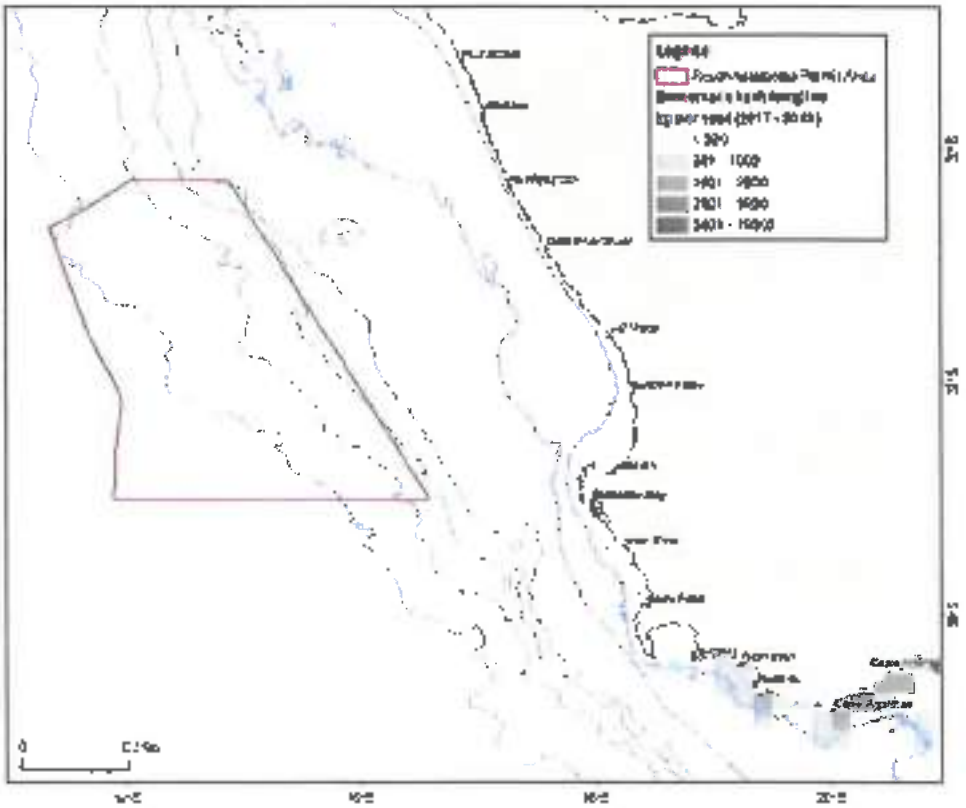

Figure 60: An overview of the spatial distribution of fishing effort expended by the shark-directed demersal longline sector in relation to the Reconnaissance Permit application area.

8.5.3.5 SMALL PELAGIC PURSE-SEINE

The pelagic-directed purse-seine fishery targets anchovy (*Engraulis encrasicolus*) and adult sardine (*Sardinops sagax*). Right Holders may also target round herring (*Etrumeus whiteheadi*) and meso pelagic species (Lantern and Lightfish combined) which have industry precautionary upper catch limits (PUCLs) – currently set at 100 000 t for round herring and 50 000 t for Lantern and Lightfish (combined). Bycatch species are mainly juvenile sardine, horse mackerel and chub mackerel. It is the largest South African fishery by volume (tons landed) and the second most important in terms of economic value. The wholesale value of catch landed by the sector during 2017 was R2.164 Billion, or 22% of the total value of all fisheries combined.

The total combined catch of anchovy, sardine and round herring landed by the pelagic fishery has decreased by 38% from 395 000 t in 2016 to just 243 000 t in 2021 (Figure 61). This is below both long-term (338 000 t) and short-term (294 000 t) averages.

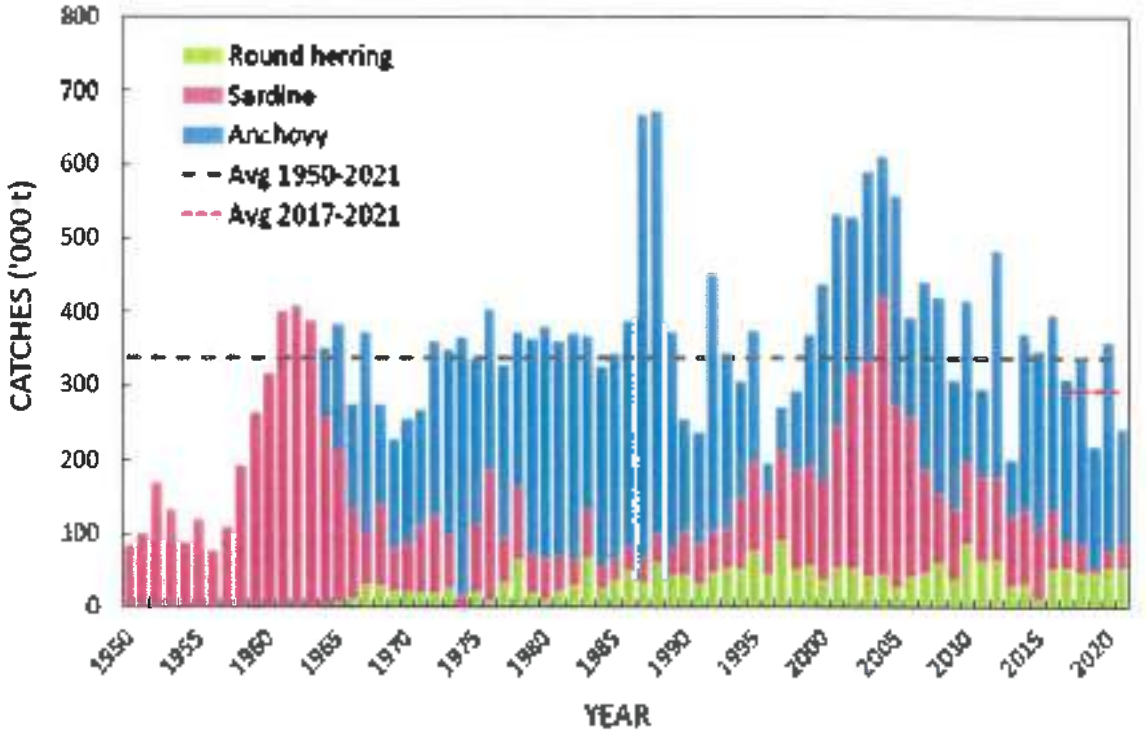

Figure 61: The annual combined catch of anchovy, sardine and round herring. Also shown is the average combined catch since the start of the fishery (1950-2021; black dashed line) and for the past five years (red solid line). Source DFFE, 2022.

The abundance and distribution of small pelagic species fluctuates considerably in accordance with the upwelling ecosystem in which they exist. Fish are targeted in inshore waters, primarily along the west and south Coasts of the Western Cape and the Eastern Cape coast, up to a maximum offshore distance of about 100 km.

The fleet consists of approximately 100 wooden, glass-reinforced plastic and steel-hulled vessels ranging in length from 11m to 48 m. The targeted species are surface-shoaling and once a shoal has been located the vessel will steam around it and encircle it with a large net, extending to a depth of 60 m to 90 m (Figure 62). Netting walls surround aggregated fish, preventing them from diving downwards. These are surface nets framed by lines: a float line on top and lead line at the bottom. Once the shoal has been encircled the net is pursed, hauled in and the fish pumped on board into the hold of the vessel. It is important to note that after the net is deployed, the vessel has no ability to manoeuvre until the net has been fully recovered on board and this may take up to 1.5 hours. Vessels usually operate overnight and return to offload their catch the following day.

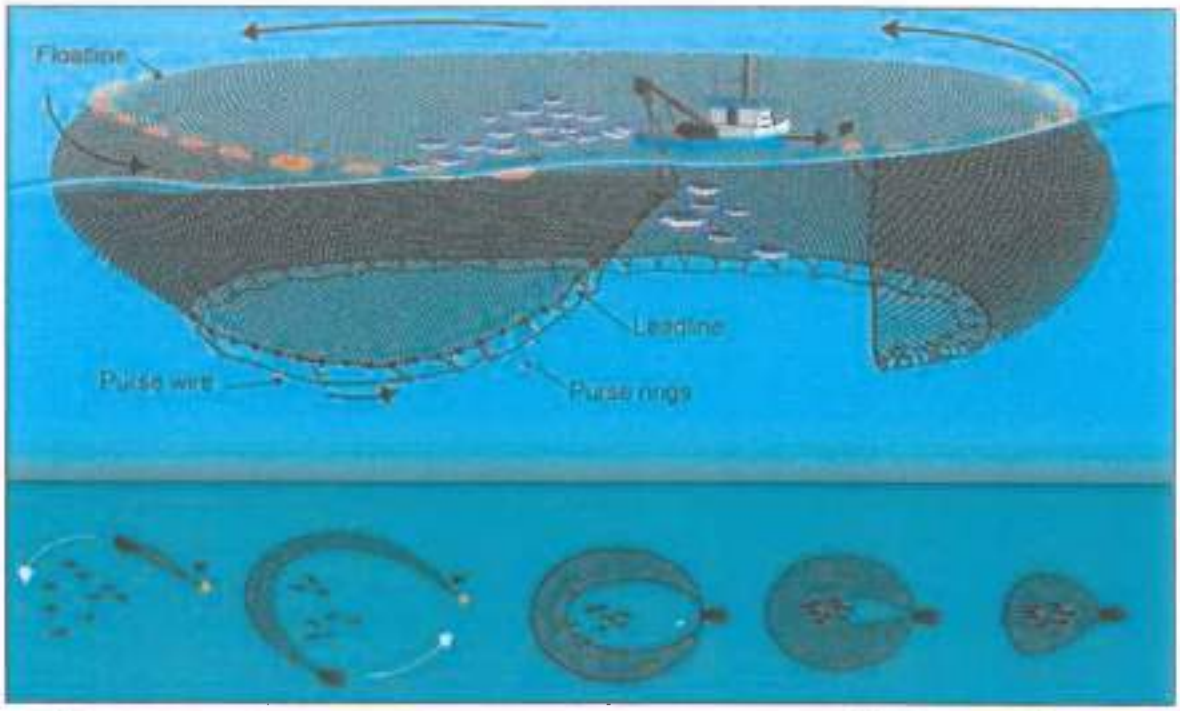

Figure 62: Typical configuration and deployment of a small pelagic purse seine for targeting anchovy, sardine and round herring as used in South African waters. Source: http://www.afma.gov.au/portfolio-item/purse-seine

The majority of the fleet operate from St Helena Bay, Lamberts Bay, Saldanha Bay and Hout Bay with fewer vessels operating on the South Coast from the harbours of Gansbaai, Mossel Bay and Port Elizabeth. Ports of deployment correspond to the location of canning factories and fish reduction plants along the coast. The geographical distribution and intensity of the fishery is largely dependent on the seasonal fluctuation and distribution of the targeted species. The sardine-directed fleet concentrates effort in a broad area extending from Lambert's Bay, southwards past Saldanha and Cape Town towards Cape Point and then eastwards along the coast to Mossel Bay and Port Elizabeth. The anchovy-directed fishery takes place predominantly on the South-West Coast from Lambert's Bay to Kleinbaai (19.5°E) and similarly the intensity of this fishery is dependent on fish availability and is most active in the period from March to September. Round herring (non-quota species) is targeted when available and specifically in the early part of the year (January to March) and is distributed from Lambert's Bay to south of Cape Point. This fishery may extend further offshore than the sardine and anchovy-directed fisheries. The catch and effort statistics for this sector are recorded by skippers on a grid block basis therefore the resolution of 10 by 10 nautical minutes.

The fishery operates throughout the year with a short seasonal break from mid-December to mid-January. Seasonality of catches is shown in Figure 63 with an increase in fishing effort and landings evident during the winter months.

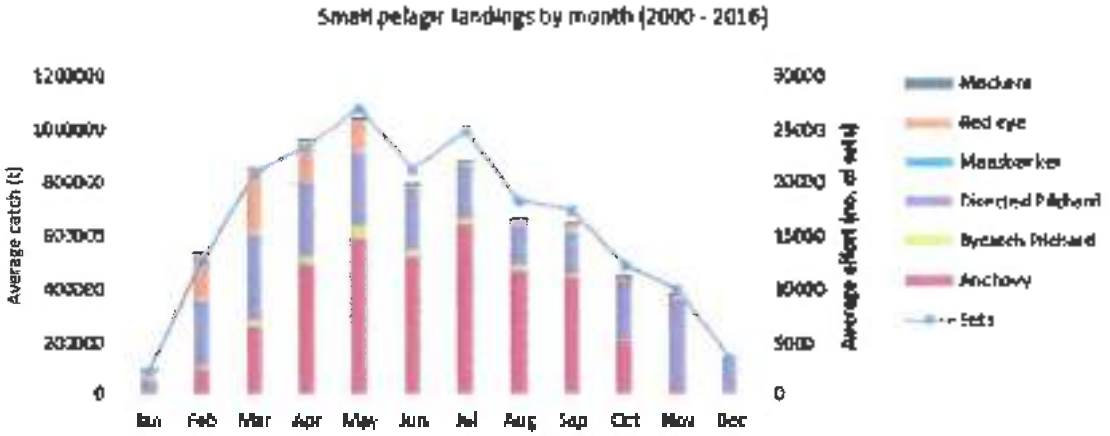

Figure 63: Graph showing monthly catch (tons) and effort (number of sets) reported for the small pelagic purse-seine fleet over the period 2000 to 2016 (cumulative).

Figure 64 shows the spatial extent of fishing grounds used by the sector over the period 2000 to 2016 in relation to the Reconnaissance Permit application area. The majority of fishing effort takes place in waters shallower than 200 m along the coastline of the Western Cape. Fishing grounds lie at least 60 km inshore of the Reconnaissance Permit application area and there is no overlap.

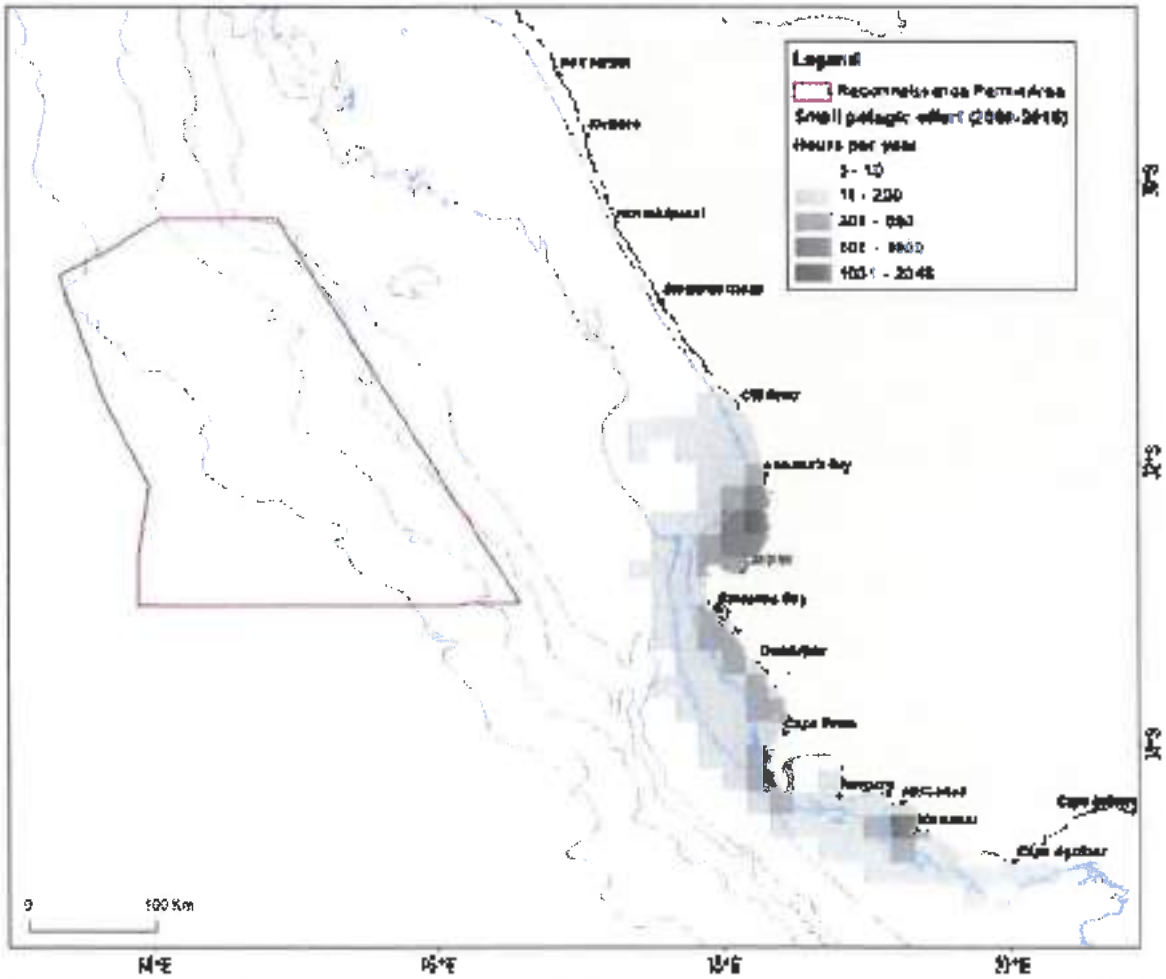

Figure 64: An overview of the spatial distribution of fishing effort recorded by the purse-seine sector targeting small pelagic species in in relation to the Reconnaissance Permit application area.

8.5.3.6 LARGE PELAGIC LONGLINE

Highly migratory tuna and tuna-like species are caught on the high seas and seasonally within the South African Exclusive Economic Zone (EEZ) by the pelagic longline and pole fisheries. Targeted species include albacore (*Thunnus alalunga*), bigeye tuna (*T. obesus*), yellowfin tuna (*T. albacares*) and swordfish (*Xiphias gladius*). The wholesale value of catch landed by the sector during 2017 was R154.2 Million, or 1.6% of the total value of all fisheries combined, with landings of 2541 tons (2017) and 2815 tons (2018). During the period 2000 to 2016, the sector landed an average catch of 4527 tons and set 3.55 million hooks per year. Catch and effort figures reported by the South African large pelagic longline fishery for the years 2000 to 2018 are shown in Figure 65. Catch by species and number of active vessels for each year from 2005 to 2018 are given in Table 20.

Catches landed by the South African fleet operating in the ICCAT region (i.e. off the West Coast) from 1998 – 2020 are shown in Figure 66.

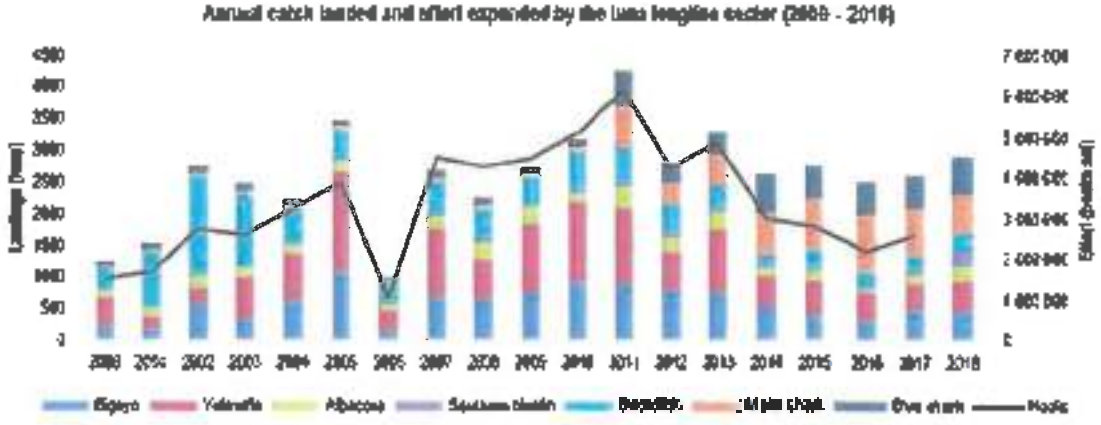

Figure 65: Inter-annual variation of catch landed and effort expended by the large pelagic longline sector in South African waters as reported to the two regional management organisations, ICCAT and IOTC (2000 - 2018).

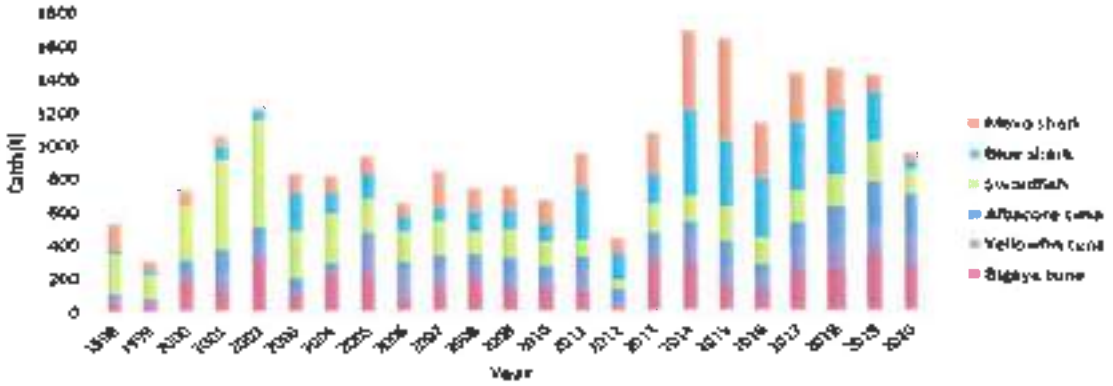

Figure 66: Inter-annual variation of catch landed by the large pelagic longline sector operating in the ICCAT region of South African waters (i.e. West of 20°E) (1998 – 2020).

Tuna, tuna-like species and billfishes are migratory stocks and are therefore managed as a "shared resource" amongst various countries under the jurisdiction of the International Commission for the Conservation of Atlantic Tunas (ICCAT) and the Indian Ocean Tuna Commission (IOTC). In the 1970s to mid-1990s the fishery was exclusively operated by Asian fleets (up to 150 vessels) under bilateral agreements with South Africa. From the early 1990s these vessels were banned from South African waters and South Africa went through a period of low fishing activity as fishing rights issues were resolved. Thereafter a domestic fishery developed and 50 fishing rights were allocated to South Africans only. These rights holders now include a fleet of local longliners and several Japanese vessels fishing in joint ventures with South African companies. In 2017, 60 fishing rights were allocated for a period of 15 years. The total number of active longline vessels within South African waters is 22, 18 of which fished in the Atlantic (West of 20°E) during 2017. These were exclusively domestic vessels, with three Japanese vessels fishing exclusively in the Indian Ocean (East of 20°E) during 2017 (DAFF, 2018).

Gear consists of monofilament mainlines of between 25 km and 100 km in length which are suspended from surface buoys and marked at each end. As gear floats close to the water surface it would present a potential obstruction to surface navigation as well as a snagging risk to the gear array towed by the seismic survey vessel. The main fishing line is suspended about 20 m below the water surface via dropper lines connecting it to surface buoys at regular intervals. Up to 3500 baited hooks are attached to the mainline via 20 m long trace lines, targeting fish at a depth of 40 m below the surface. Various types of buoys are used in combinations to keep the mainline near the surface and locate it should the line be cut or break for any reason. Each end of the line is marked by a Dahn Buoy and radar reflector, which marks the line position for later retrieval. Typical configuration of set gear is shown in Figure 67.

FL28

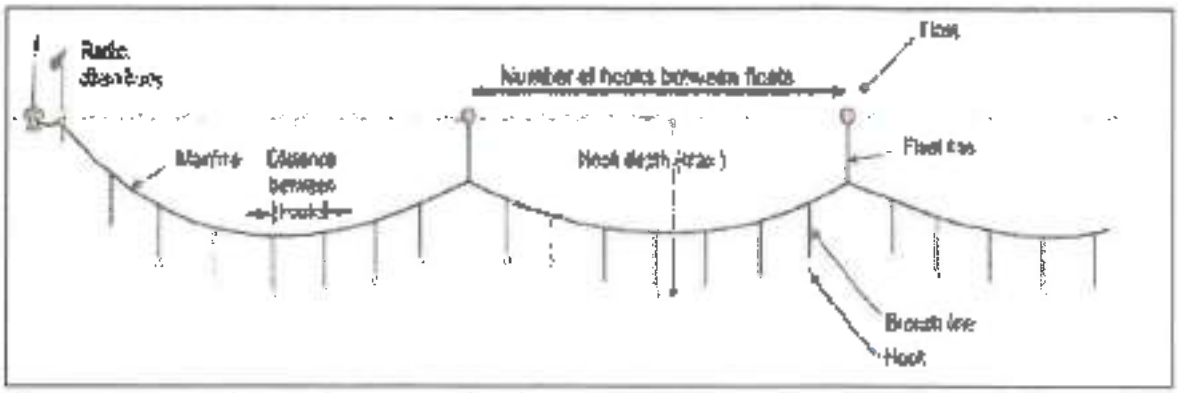

Figure 67: Schematic diagram showing typical configuration of longline gear targeting pelagic species (left), and photograph of typical high seas longline vessel (upper right).

Lines are usually set at night, and may be left drifting for a considerable length of time before retrieval, which is done by means of a powered hauler at a speed of approximately one knot. During hauling, vessel manoeuvrability is severely restricted. In the event of an emergency, the line may be dropped and hauled in at a later stage. The fishery operates year-round with a relative increase in effort during winter and spring. Catch per unit effort (CPUE) variations are driven both by the spatial and temporal distribution of the target species and by fishing gear specifications. Variability in environmental factors such as oceanic thermal structure and dissolved oxygen can lead to behavioural changes in the target species, which may in turn influence CPUE (Purnby and Nakano, 1992).

Fishing areas are subdivided into the SE Atlantic (reporting to ICCAT) and the SW Indian Ocean (reporting to IOTC) along 20°E, and the West, Southwest, South and East sampling areas are shown. Bubble size is proportional to the numbers of hooks set per line. The numbers of hooks set by foreign vessels peaked between May and October each year, whereas local vessels fished throughout the year, with marginally fewer hooks set in January and February than other months (Figure 68b). Foreign vessels ventured further southwards than local vessels, which tended to remain within the EEZ (Figure 69; Jordaan *et al.*, 2018).

Local vessels fish in all four areas, but in the East their range is limited to the northern half of the area, near a landing site at Richards Bay. Foreign vessels fished mainly in the SW Indian Ocean, with the bulk of all hooks set in the South (58%) and East (35%) areas, and the remaining 9% in the SE Atlantic (Figure 68b). Foreign vessels set an average of 2 493 ± 597 (SD) hooks per line, compared to only 1 282 ± 250 hooks per line used by local vessels.

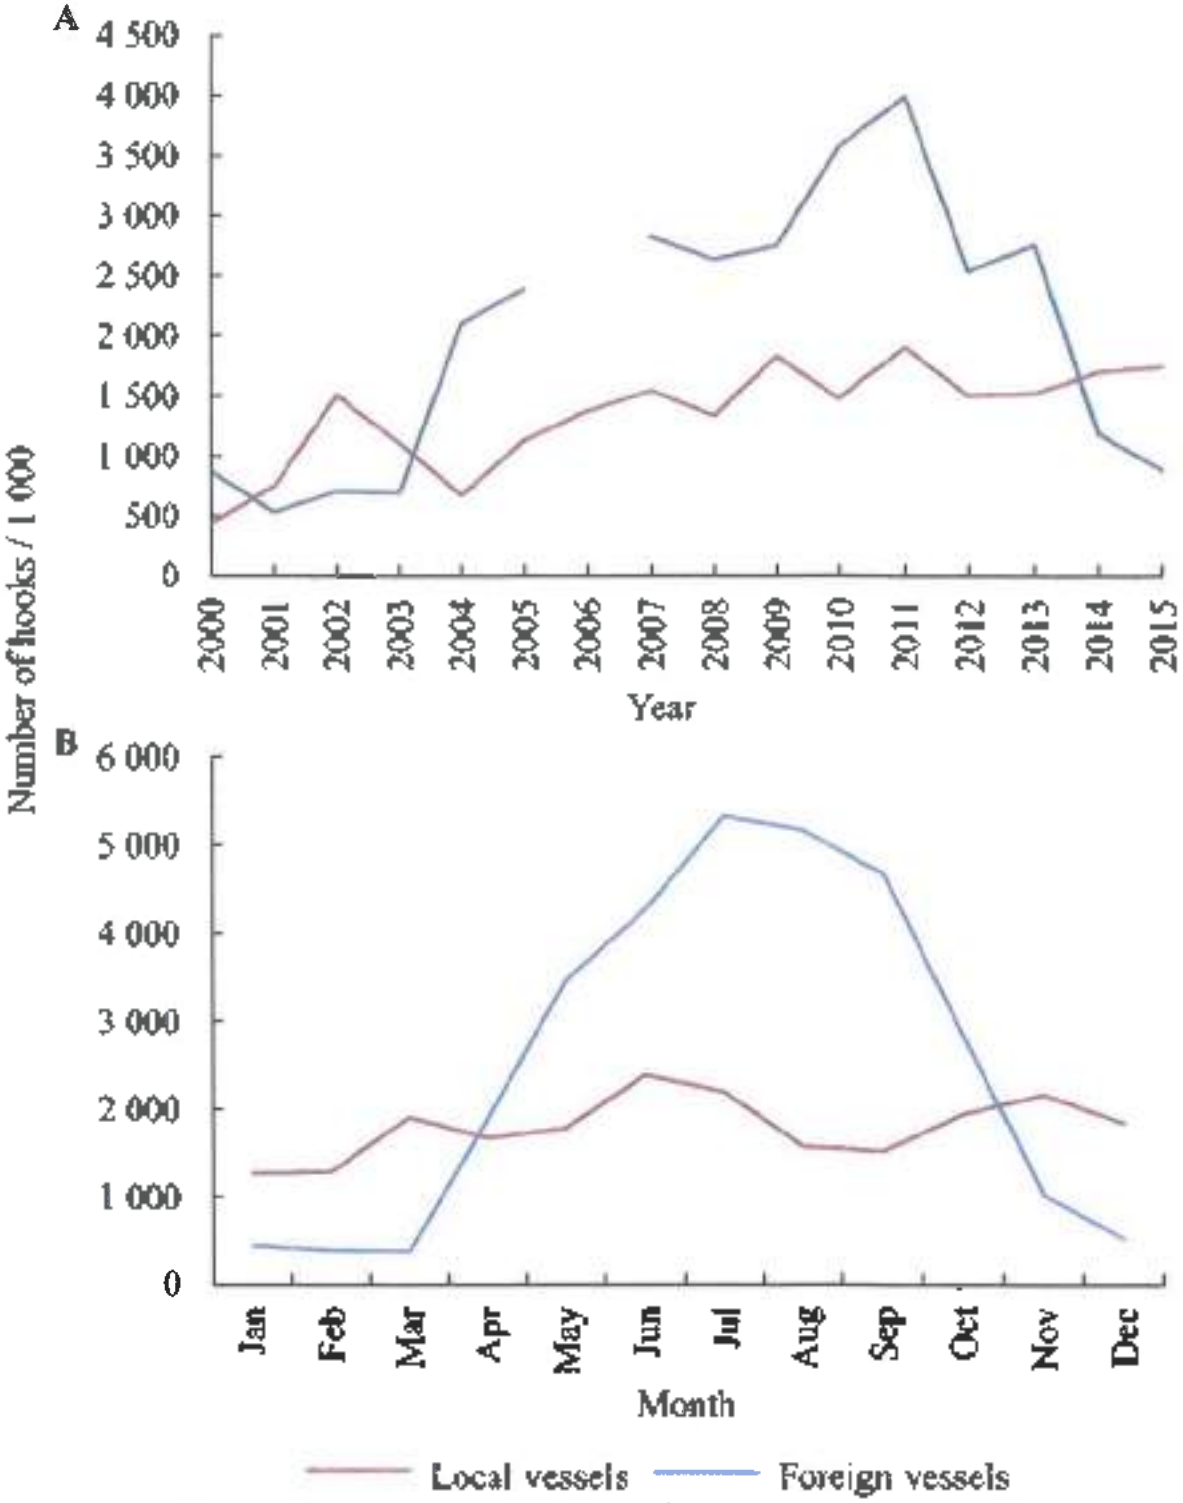

Figure 68: Numbers of hooks set per (A) year (2000–2015) and (B) per calendar month, as reported by local and foreign pelagic longliners fishing in the study area (Jordaan *et al.*, 2018).

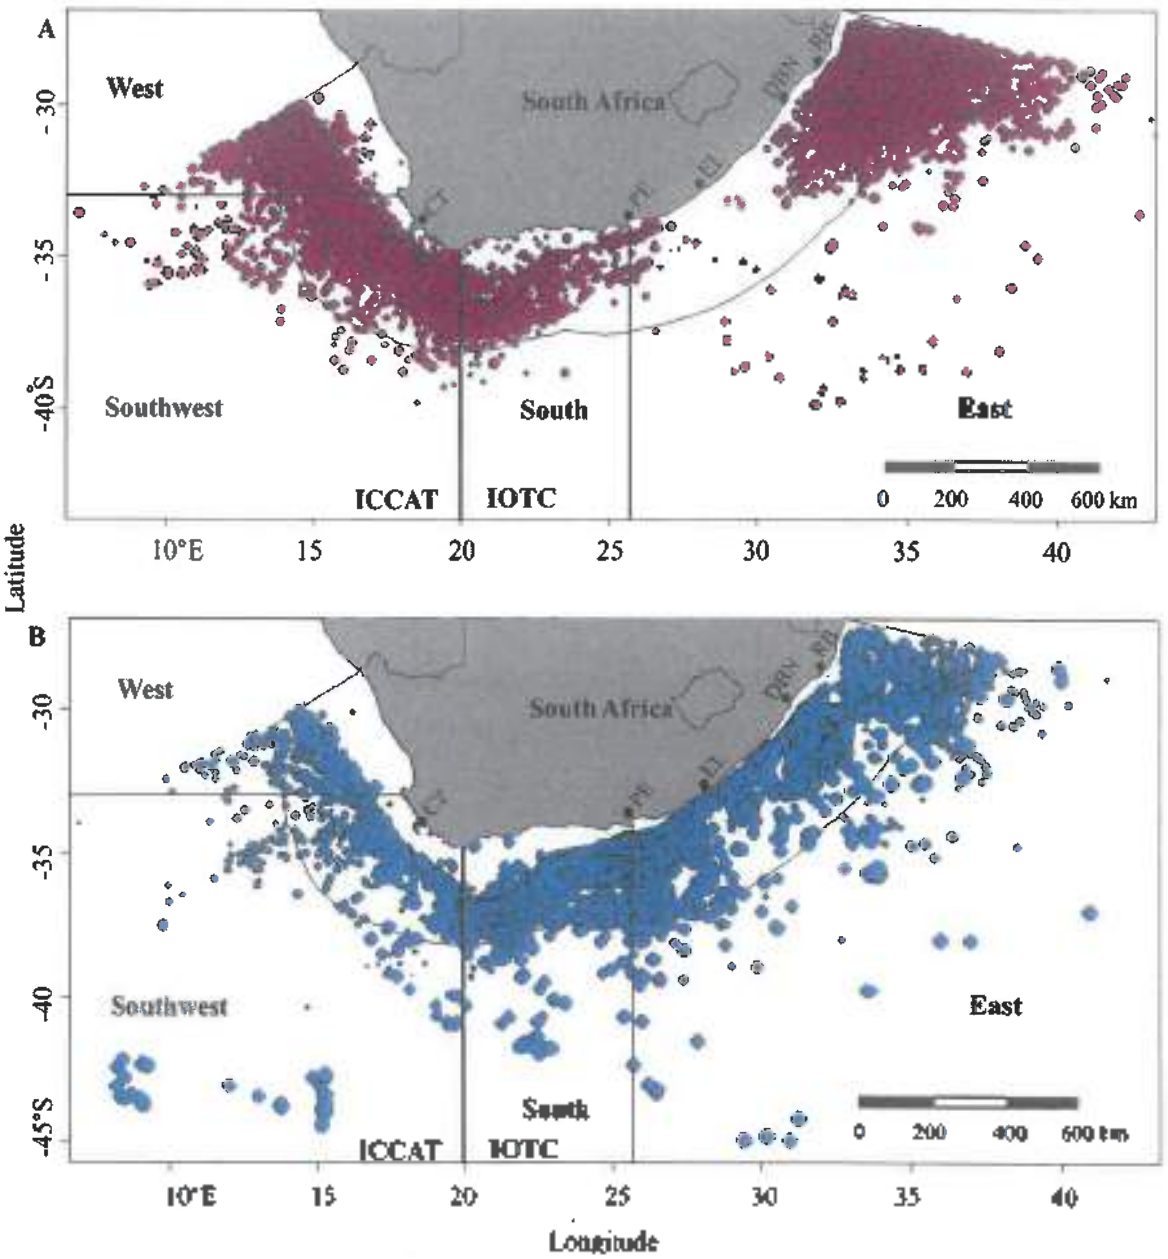

Figure 69: Geographical distribution of fishing effort by (A) local and (B) foreign pelagic longliners from 2000 to 2015, based on logbook data provided by vessel skippers (Jordaan *et al.*, 2018).

Rights Holders in the large pelagic longline fishery are required to complete daily logs of catches, specifying catch locations, number of hooks, time of setting and hauling, bait used, number and estimated weight of retained species, and data on bycatch. The fishery operates extensively within the South African EEZ, primarily along the continental shelf break and into deeper waters. The recent spatial distribution of catch (2017 to 2019) in relation to the Reconnaissance Permit area is shown in Figure 70. Over this period, an average of 423 lines per year were set within the area yielding 579 tons of catch. This is equivalent to 10.29% of the overall effort and 8.1% of the total catch reported by the sector at a national scale.

Pelagic longline fishing activity can be expected along the inshore extent of the Reconnaissance Permit area especially in the northern extent of the area. Lines of up to 100 km in length are *set* along the continental shelf break, and are left to drift in surface currents for several hours before retrieval. They therefore cover a large area whilst they drift and pose a significant risk of entanglement with a towed seismic array.

Average monthly catch and effort within the Reconnaissance Permit area is shown in Figure 71. This shows that catch is highest during the months of June and July, associated with an increase in fishing effort by the sector.

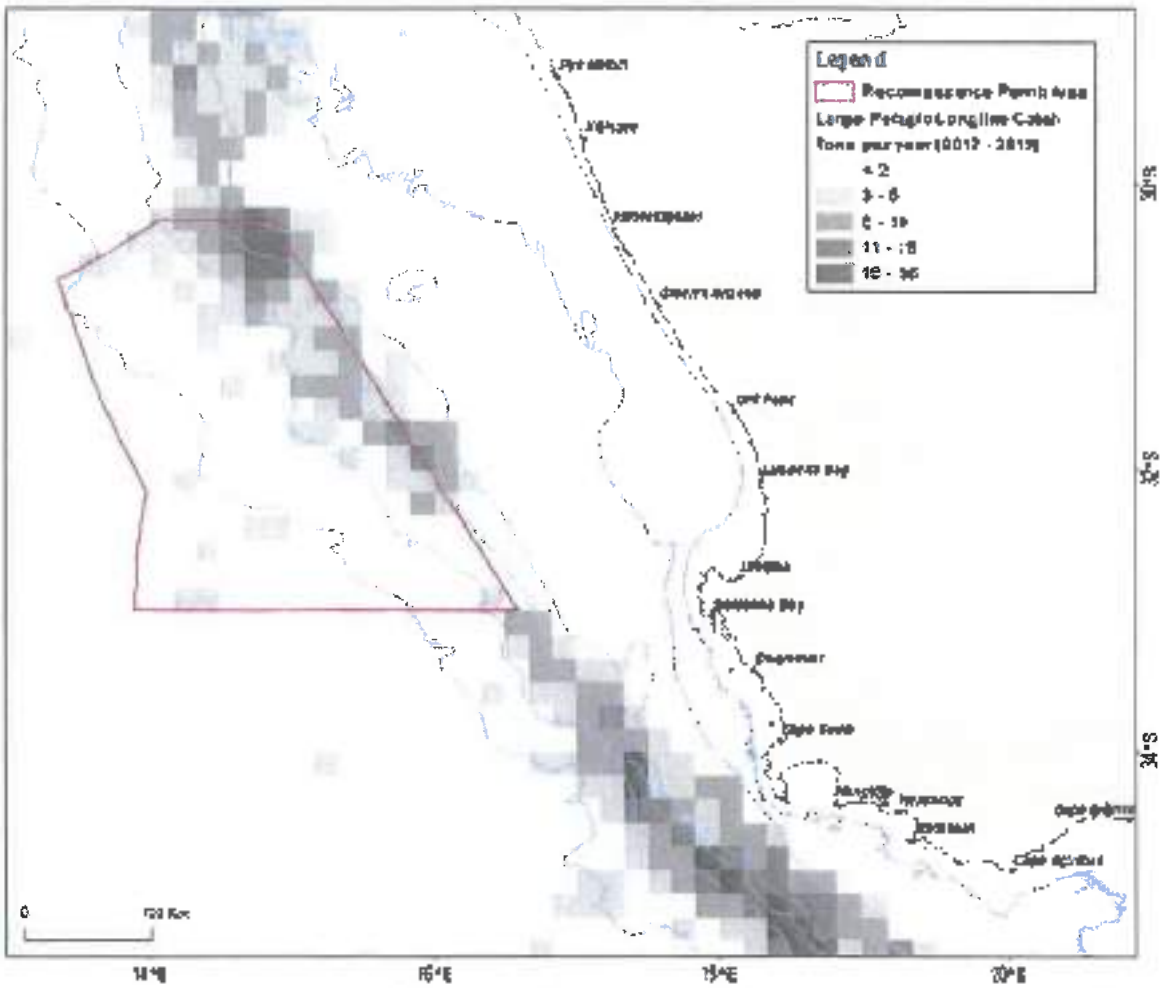

Figure 70: An overview of the spatial distribution of fishing effort expended by the longline sector targeting large pelagic fish species in relation to the Reconnaissance Permit application area.

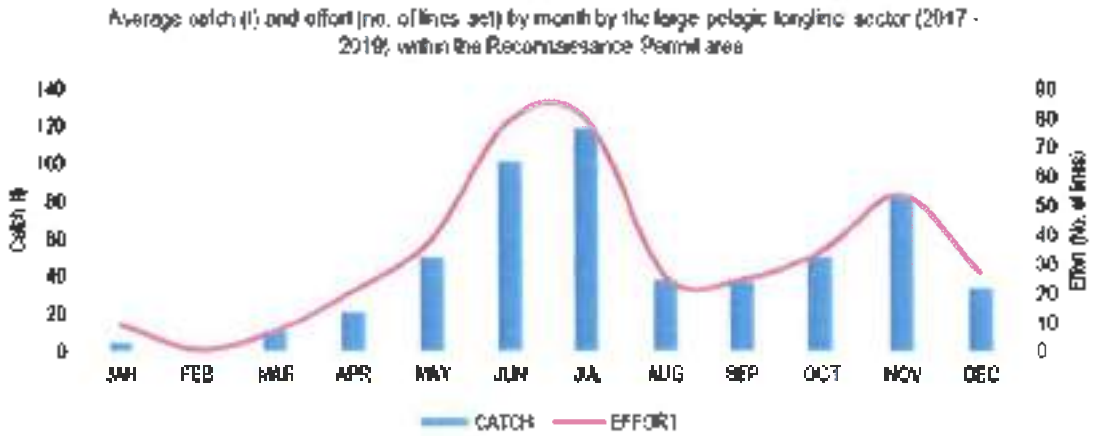

Figure 71: Average catch (t) and effort (no. of lines set) by month reported by the large pelagic longline sector in the vicinity of the Reconnaissance Licence area (2017-2019).

8.5.3.7 TUNA POLE-LINE

Poling for tuna is predominantly based on the southern Atlantic longfin tuna stock also referred to as albacore (*T. alalunga*). Other catch species include yellowfin tuna, bigeye tuna, skipjack tuna (*Katsuwonus pelamis*). The fishery is seasonal with vessels active predominantly between November and June and peak catches recorded

from November to January. Due to the seasonality of tuna in South Africa's waters the tuna pole fishery is also allowed access to snoek (*Thyrsites atun*) and yellowtail (*Seriola lalandi*). Snoek-directed fishing activity is seasonal, taking place in coastal areas during the period March to July, with a peak in activity during the months of April and May. Access to these additional species has caused conflict with the traditional linefish sector.

The reported wholesale value of the fishery in 2018 was R124 Million in 2018, or 1.2% of the total value of all fisheries combined. In 2020, landings of albacore amounted to 3941 tons. A historical time series of catch and effort reported by the South African sector operating within the Atlantic region is shown in Table 21. The total effort of 4131 catch days within the ICCAT convention area in 2019 represents an increase in effort of 9% compared to 2018. The total reported annual pole fleet catch of the main target species albacore and yellowfin tuna showed for the first-time relative increases since 2015 and 2014, respectively.

Table 21: Total number of fishing days (effort), active vessels and total catch (t) of the main species caught by South African-flagged tuna pole-line vessels in the ICCAT region (West of 20E), 2008 – 2020 (ICCAT, 2022).

	Total Effort		Catch (t)			
Year	Fishing days	Active vessels	Albacore	Yellowfin tuna	Bigeye tuna	Skipjack tuna
2008	3052	113	3083	347	8	4
2009	4431	123	4586	123	17	4
2010	4408	116	4067	177	8	1
2011	5001	118	3166	629	15	5
2012	5157	123	3483	161	11	8
2013	4114	107	3492	374	142	3
2014	4416	95	3620	1351	50	5
2015	4736	91	3838	685	57	2
2016	4908	98	2001	598	10	2
2017	3062	92	1640	235	22	7
2018	3751	92	2959	242	14	2
2019	4131	91	2190	378	91	2
2020	3975	97	3941	534	71	1

The active fleet consists of approximately 92 pole-and-line vessels (also referred to as "baitboat"), which are based at the ports of Cape Town, Hout Bay and Saldanha Bay. Vessels normally operate within a 100 nm radius of these locations with effort concentrated in the Cape Canyon area (South-West of Cape Point), and up the West Coast to the Namibian border with South Africa.

Vessels are typically small (an average length of 16 m but ranging up to 25 m). Catch is stored on ice, refrigerated sea water or frozen at sea and the storage method often determines the range of the vessel. Trip durations average between four and five days, depending on catch rates and the distance of the fishing grounds from port. Vessels drift whilst attracting and catching shoals of pelagic tunas. Sonars and echo sounders are used to locate schools of tuna. Once a school is located, water is sprayed outwards from high-pressure nozzles to simulate small baitfish aggregating near the water surface. Live bait is then used to entice the tuna to the surface (chumming). Tuna swimming near the surface are caught with hand-held fishing poles. The ends of the poles are

fitted with a short length of fishing line leading to a hook. In order to land heavier fish, lines may be strung from the ends of the poles to overhead blocks to increase lifting power (see Figure 73).

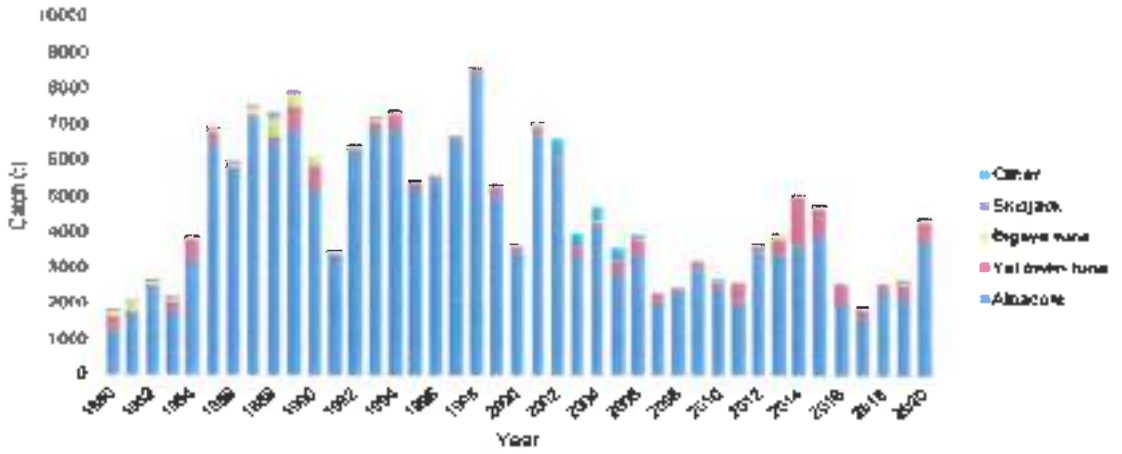

Figure 72: Catches (tons) of pelagic species by the South Africa pole-line ("Baitboat") fleet between 1980 and 2020 (ICCAT, 2022).

Figure 73: Schematic diagram of pole and line operation (Source: http://www.afma.gov.au/portfolio-item/miscc-lines).

The nature of the fishery and communication between vessels often results in a large number of vessels operating in close proximity to each other at a time. The vessels fish predominantly during daylight hours and are highly manoeuvrable. However, at night in fair weather conditions the fleet of vessels may drift or deploy drogues to remain within an area and would be less responsive during these periods.

Figure 74 shows the location of fishing activity in relation to Reconnaissance Permit application area. Fishing activity for tuna occurs along the entire West Coast beyond the 200 m bathymetric contour, along the shelf break with favoured fishing grounds including areas north of Cape Columbine and between 60 km and 120 km offshore of Saldanha Bay. Fishing records received from DFFE for the reporting period 2017 to 2019 show that tuna-directed fishing takes place inshore of the Reconnaissance Permit application area within minimal activity within the area itself. An average of 24 fishing events per year were set within the area yielding 25 tons of albacore (although it is likely that some of this activity may be errors in the reporting of fishing positions and the likelihood of fishing activity within the area is considered to be low). The catch and effort within the area is equivalent to 0.87% and 0.95%, respectively, of the overall catch and effort reported by the sector at a national scale.

Albacore-directed fishing activity within deeper waters adjacent to the Reconnaissance Permit area shows a peak during February and March (see Figure 75). Snoek-directed fishing activity is coastal and seasonal in nature – taking place inshore of the 100 m depth contour during the period March to July, with a peak in activity during

the months of April and May. Snoek-directed fishing activity is situated at least 140 km inshore of the application area and there is therefore no overlap of the survey expected with snoek-directed fishing activity.

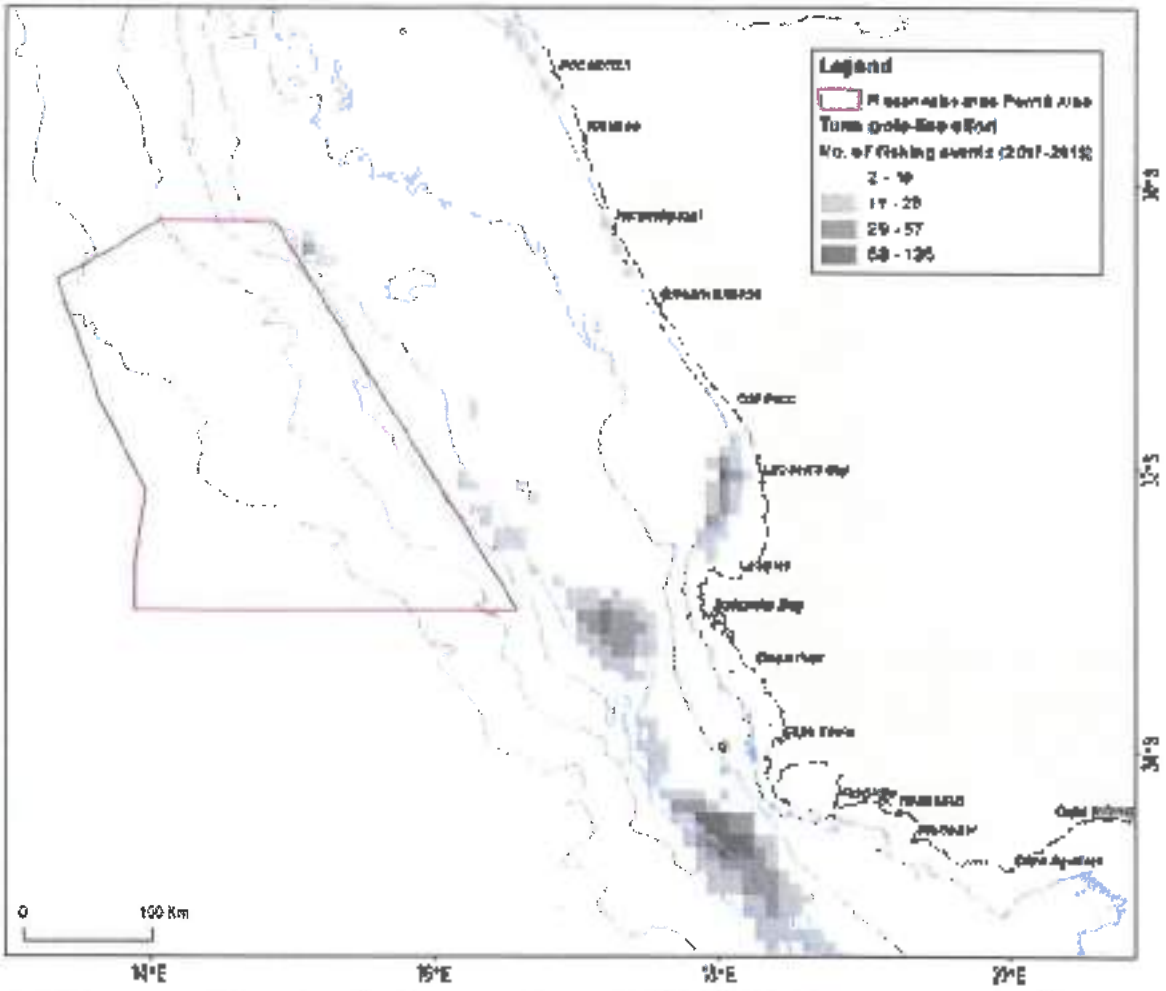

Figure 74: An overview of the spatial distribution of fishing effort expended by the pole- line sector targeting pelagic tuna (offshore areas) and snoek (inshore areas) in relation to the Reconnaissance Permit application area.

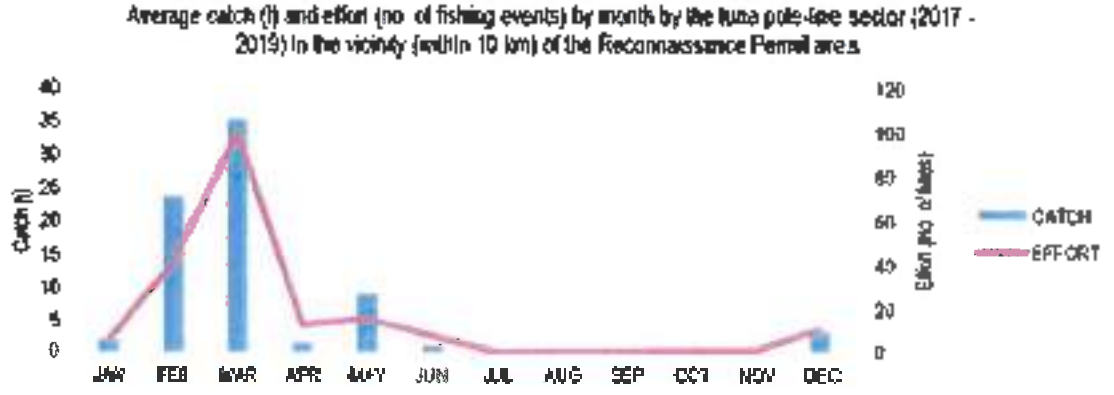

Figure 75: Average catch (t) and effort (no. of fishing events) by month reported by the tuna pole-line sector in the vicinity (within 10 km) of the Reconnaissance Licence area (2017-2019).

8.5.3.8 TRADITIONAL LINEFISH

The commercial linefish sector has its origins from the recreational sector. Essentially recreational linefishers commercialised resulting in a systematic decline in the "linefish" stocks. The Minister of Fisheries in the 1980's reformed the sector. This was done by creating a small commercial linefish sector, as well as introducing a moratorium on exploiting many species that were collapsed or near collapse. The commercial linefish sector now only allows a limited number of key species to be exploited.

Of all South African marine fisheries, the line fishery is the most vulnerable to external impacts. Linefish resources are at risk of overcapacity as they are directly or indirectly exploited by other sectors, including the recreational, small-scale line fishery, inshore and offshore trawl fisheries, tuna pole-line fishery, the inshore net fishery and the demersal shark longline fishery (DEFF, 2020). The increased expectation of commercial access to linefish resources combined with the localised anticipation of community ownership by small-scale fishers may impact linefish stocks.

The traditional line fishery is the country's third most important fishery in terms of tonnage landed and economic value. It is a long-standing, nearshore fishery based on a large assemblage of different species using hook and line, but excludes the use of longliners. Within the Western Cape the predominant catch species is snoek (*Thyrsites atun*) while other species such as Cape bream (hottentot) (*Pachymetopon blochii*), geelbek (*Atractoscion aequidens*), kob (*Argyrosomus japonicus*) and yellowtail (*Seriola lalandi*) are also important. Towards the East Coast the number of catch species increases and includes resident reef fish (Sparidae and Serranidae), pelagic migrants (Carangidae and Scombridae) and demersal migrants (Sciaenidae and Sparidae). Table 22 lists the catch of important linefish species for the years 2010 to 2022.

Figure 76 shows the variability in catches of the eight most importance species by the line fishery over the period 1985 to 2021.

Table 22: Annual catch (t) of the eight most important linefish species for the period 2010 to 2021 (DEFF, 2022).

Year	Snoek	Yellowtail	Kob	Carpenter	Slinger	Hottentot seabream	Geelbek	Santer	Total catch

*Total catches unavailable at date of this report

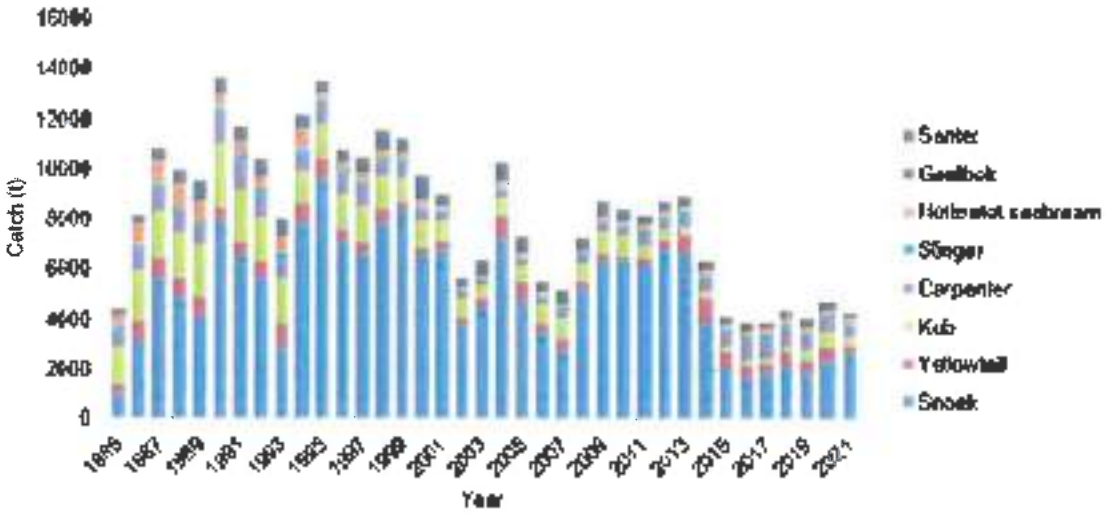

Figure 76: Annual catch (t) of the eight most important finefish species for the period 1985-2021 (DFFE, 2022).

The traditional commercial line fishery is a relatively low-cost and labour-intensive industry, therefore important from an employment and human livelihood point of view. Although the commercial line fishery has the largest fleet, it contributes only 6% of the total estimated value of all South African marine fisheries (DFFE, 2020). In 2017, the wholesale value of catch was reported as R122.1 million.

The commercial line fishery is a nearshore boat-based activity which is currently managed through a total allowable effort (TAE) allocation, based on boat and crew numbers. Since December 2000 it has consisted of 3450 crew operating from 455 commercial vessels. The number of rights holders is 425 (valid rights until 31 December 2020 and subsequently extended until 31 December 2021[4]). For the 2019/2020 fishing season, 395 vessels and 3007 crew was apportioned to commercial fishing, whilst 60 vessels and 443 crew was apportioned to small-scale fishing. DFFE proposed an increase in the apportionment of TAE to small-scale fishing from 13% to 50% commencing in 2021 in order to boost economic possibilities for coastal communities.

Annual catches prior to the reduction of the commercial effort were estimated at 16 000 tons for the traditional commercial line fishery. Almost all of the traditional line fish catch is consumed locally. The fishery is widespread along the country's shoreline from Port Nolloth on the West Coast to Cape Vidal on the East Coast. Effort is managed geographically with the spatial effort of the fishery divided into three zones. Zone A extends from Port Nolloth to Cape Infanta, Zone B extends from Cape Infanta to Port St Johns and Zone C covers the KwaZulu-Natal region.

Table 23 lists the annual Total Allowable Effort (TAE) and activated effort per line fish management zone from 2007 to 2019. Most of the catch (up to 95%) is landed by the Cape commercial fishery, which operates on the continental shelf from the Namibian border on the West Coast to the Kei River in the Eastern Cape.

Table 23: Annual total allowable effort (TAE) and activated commercial line fish effort per management zone from 2008 to 2019 (DEFF, 2020).

** In the finalisation of the 2013 commercial Traditional Linefish appeals, the effort apportioned for the small-scale fisheries sector was allocated to the commercial sector. All the small-scale fights were considered to be activated on allocation

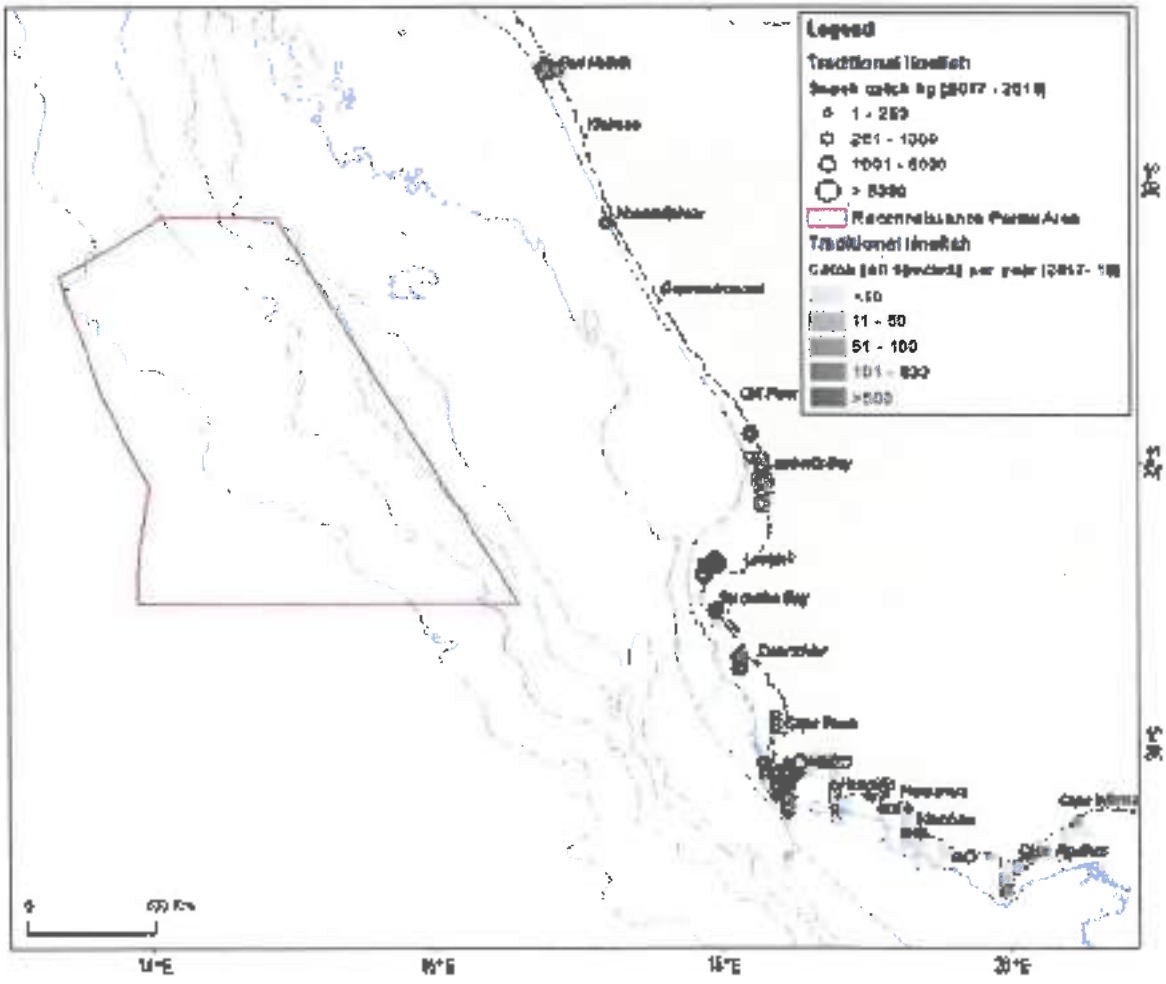
Crew use hand line or rod-and-reel to target approximately 200 species of marine fish along the full 3 000 km coastline, of which 50 species may be regarded as economically important. To distinguish between line fishing and long lining, line fishers are restricted to a maximum of 10 hooks per line. Target species include resident reef-fish, coastal migrants and nomadic species. Many species allocated to the small-scale fisheries "baskets" are primary targets of the commercial and recreational linefish sectors, and these shared resources must be carefully monitored given the increased fishing pressure expected. A revision of the linefish management protocol (LMP) is also underway to ensure the future sustainability of linefish stocks.

Vessels range in length between 4.5 m and 11 m and the offshore operational range is restricted by vessel category to 40 nautical miles (75 km). Fishing effort at this outer limit is sporadic. Operating ranges vary greatly but most of the activity is conducted within 15 km of a launch site. Fishing takes place throughout the year but there is some seasonality in catches.

Snoek is an important linefish species as it makes up the largest annual catch in terms of biomass, contributing more than 80% to the total catch west of Cape Infanta. Snoek spawning occurs offshore during winter-spring, along the shelf break (150-400 m) of the western Agulhas Bank and the South African west coast. Prevailing currents transport eggs and larvae to a primary nursery ground north of Cape Columbine and to a secondary nursery area to the east of Danger Point; both shallower than 150 m. Juveniles remain on the nursery grounds until maturity, growing to between 33 and 44 cm in the first year (3.25 cm/month). Onshore-offshore distribution (between 5- and 150-m isobaths) of juveniles is determined largely by prey availability and includes a seasonal inshore migration in autumn in response to clupeoid recruitment. Adults are found throughout the distribution range of the species, and although they move offshore to spawn - there is some southward dispersion as the spawning season progresses - longshore movement is apparently random and without a seasonal basis (Griffiths, 2002). Snoek are caught within the inshore zone along most of the South African coastline with the majority of catches being made along the West and South-West Coast of South Africa. Although snoek can be caught year-round, during the snoek seasonal migration (between April and July) when they shoal nearshore, they are caught more frequently using handlines by the line fishery. Snoek are not distributed offshore of the 1000 m depth contour and therefore not targeted or caught by the commercial line fishery in the Reconnaissance Permit area.

Spatial mapping of effort and catches in the line fishery is less accurate than in other sectors because of the reporting structure implemented by DFFE. Fishing locations are described by skippers in relation to numbered sections along the coast and estimated distance offshore. No bearings are given, and no GPS data are recorded. Furthermore, due to the large number of vessels, associated reporting complexities and also the unwillingness of local fisherman to share fishing locations, inaccuracies in the spatial representation are to be expected[5]. This fishery's operational footprint may at times be limited by operating costs and is sensitive to local reports of fish availability. Further, in regard to migratory species, such as longfin tuna and snoek, economic and regulatory aspects relating to distances fished offshore is pertinent [i.e. such as the requirements of the South African Maritime Safety Authority (SAMSA)] in particular that "B" class certified vessels can operate up to 40 nm offshore.

Figure 77 shows the spatial extent of traditional linefish grounds in relation to the Reconnaissance Permit application area. Snoek-directed fishing effort is coastal, with vessels operating in waters shallower than 100 m. However, there are records of fishing up to an offshore distance of 55 km off Saldanha Bay where tuna are targeted in the vicinity of Cape Canyon. Note that small-scale fishers are not permitted to target tuna (i.e. the species is not part of the basket allocation), thus would not be expected to operate at the Cape Canyon. There is no overlap of fishing grounds with the Reconnaissance Permit application area, which is situated at least 120 km offshore and at least 100 km from fishing grounds targeted by the linefish sector.



[5] Inaccuracies in reported fishing positions are unlikely to impact on the validity of the current assessment as a precautionary approach has already been adopted in assessing the maximum range of fishing grounds offshore with respect to the Reconnaissance Permit application area.

Figure 77: An overview of the spatial distribution of catch taken by the linefish sector in relation to the Reconnaissance Permit application area. The inset component of catch is shown as well as total catch of all species.

8.5.3.9 WEST COAST ROCK LOBSTER

The West Coast rock lobster (*Jasus lalandii*) is a valuable resource found off the South African West Coast and consequently an important income source for West Coast fishermen providing employment for about 4200 people. The resource occurs inside the 200 m depth contour along the West Coast from Namibia to East London on the East Coast of South Africa. Fishing grounds stretch from the Orange River mouth to east of Cape Hangklip in the South-Eastern Cape although the commercial viability is focused mainly southwards from Management Zone B (see Figure 80).

The fishery is comprised of four sub-sectors – commercial offshore, commercial nearshore, small-scale and recreational, all of which have to share from the same notional TAC. The 2021/22 TAC was set at 600 tonnes and apportionment of TAC by sub-sector is listed in Table 24. The TAC for the 2021/2022 fishing season was reduced by 28% from the previous fishing season (2020/2021). The updated stock assessment for the resource has indicated that it is further depleted than was thought to be the case two years ago, and poaching[4] is one of the major contributors to the recently exacerbated depleted status of the resource. The resource has over recent decades been at about 2.5% of the pristine level, but that over the last few years this had dropped to about 1.5%.

Annual TAC and average monthly landings over the period 2006 to 2020 are shown in Figure 78 and Figure 79, respectively. A historical time-series of TACs and landings is listed in Table 25.

Table 24: Apportionment of TAC of rock lobster by sub-sector (modified DFFE, 2021).

Description	2019/2020 TAC (t)	2020/2021 TAC (t)	2021/2022 (t)
Commercial fishing (offshore)	563.91	435.38	301.28

1 No interim Relief allocated; 2 Interim Relief accommodated under Recreational allocation; 3 Total catch by all sectors.

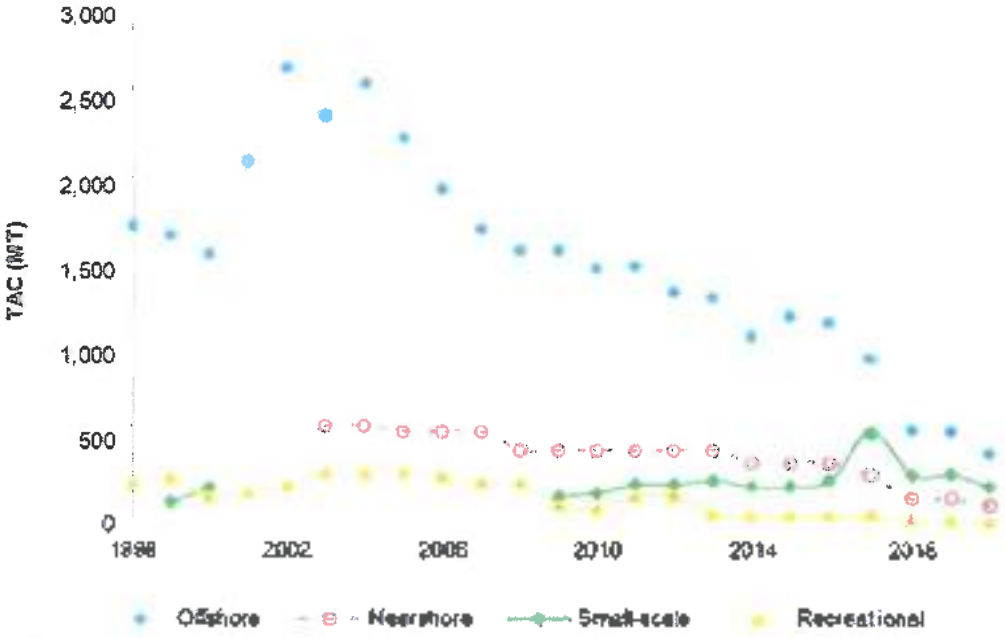

Figure 78: Graph showing the total allowable catch (TAC) of west coast rock lobster.

Figure 79: Graph showing the average monthly catch (tonnes) and effort (number of traps hauled) reported by the offshore (trapboat) and inshore (bakkie) rock lobster sectors over the period 2006 to 2020.

The resource is managed geographically, with TACs set annually for different management areas. The commercial and small-scale fishing sectors are authorised to undertake fishing for four months in each management zone therefore closed seasons are applicable to different management zones. The start and end dates for the 2021/22 fishing season per sector and zone are shown in Table 26.

Table 26: Start and end dates for the fishing season 2021/22 by management zone. Special Project Report on the review of the TAC for West Coast Rock Lobster for the 2021/22 fishing season by the Consultative Advisory Forum for Marine Living Resources.

Area	Commercial nearshore, interim relief, small-scale: nearshore	Commercial offshore, small-scale: offshore
Area 1 + 2	15 Oct, Nov, Dec, Jan, 15 Feb	
Area 3 + 4	15 Nov, Dec, Jan, Feb, 15 Mar	15 Nov, Dec, Jan, Feb, 15 Mar

Area	Commercial nearshore, interim relief, small-scale: nearshore	Commercial offshore, small-scale: offshore
Area 5 + 6	15 Nov, Dec, Jan, Feb, 15 Mar	
Area 7		Dec, Jan, Feb, Mar
Areas 8 and 11	15 Nov, Dec, Jan, Feb, 15 Mar	Jan, Mar, Apr, May
Area 8 (deep water)		Jun, Jul
Areas 12, 13 and 14	15 Nov, Dec, Jan, Feb, 15 Mar	

The commercial offshore sector operates at a depth range of approximately 90 m to 100 m, making use of traps consisting of rectangular metal frames covered by netting. These traps are set at dusk and retrieved during the early morning. Approximately 138 vessels participate in the offshore sector.

The commercial nearshore sector makes use of hoop nets to target lobster at discrete suitable reef areas along the shore at a water depth of up to 15 – 30 m. These are deployed from a fleet of small dinghies/bakkies which operate from the shore and coastal harbours. Approximately 653 boats participate in the sector.

The delineation of management zones is shown in Figure 80. The five super-areas are: areas 1–2, corresponding to zone A; areas 3–4, to zone B; areas 5–6, to zone C; area 7, being the northernmost area within zone D; and area 8+, comprising area 8 of zone D as well as zones E and F.

Figure 81 shows rock lobster catch by management zone for the commercial offshore and nearshore sub-sectors. The Reconnaissance Permit area is situated at least 115 km from the closest rock lobster fishing grounds and there is no spatial overlap (see Figure 82).

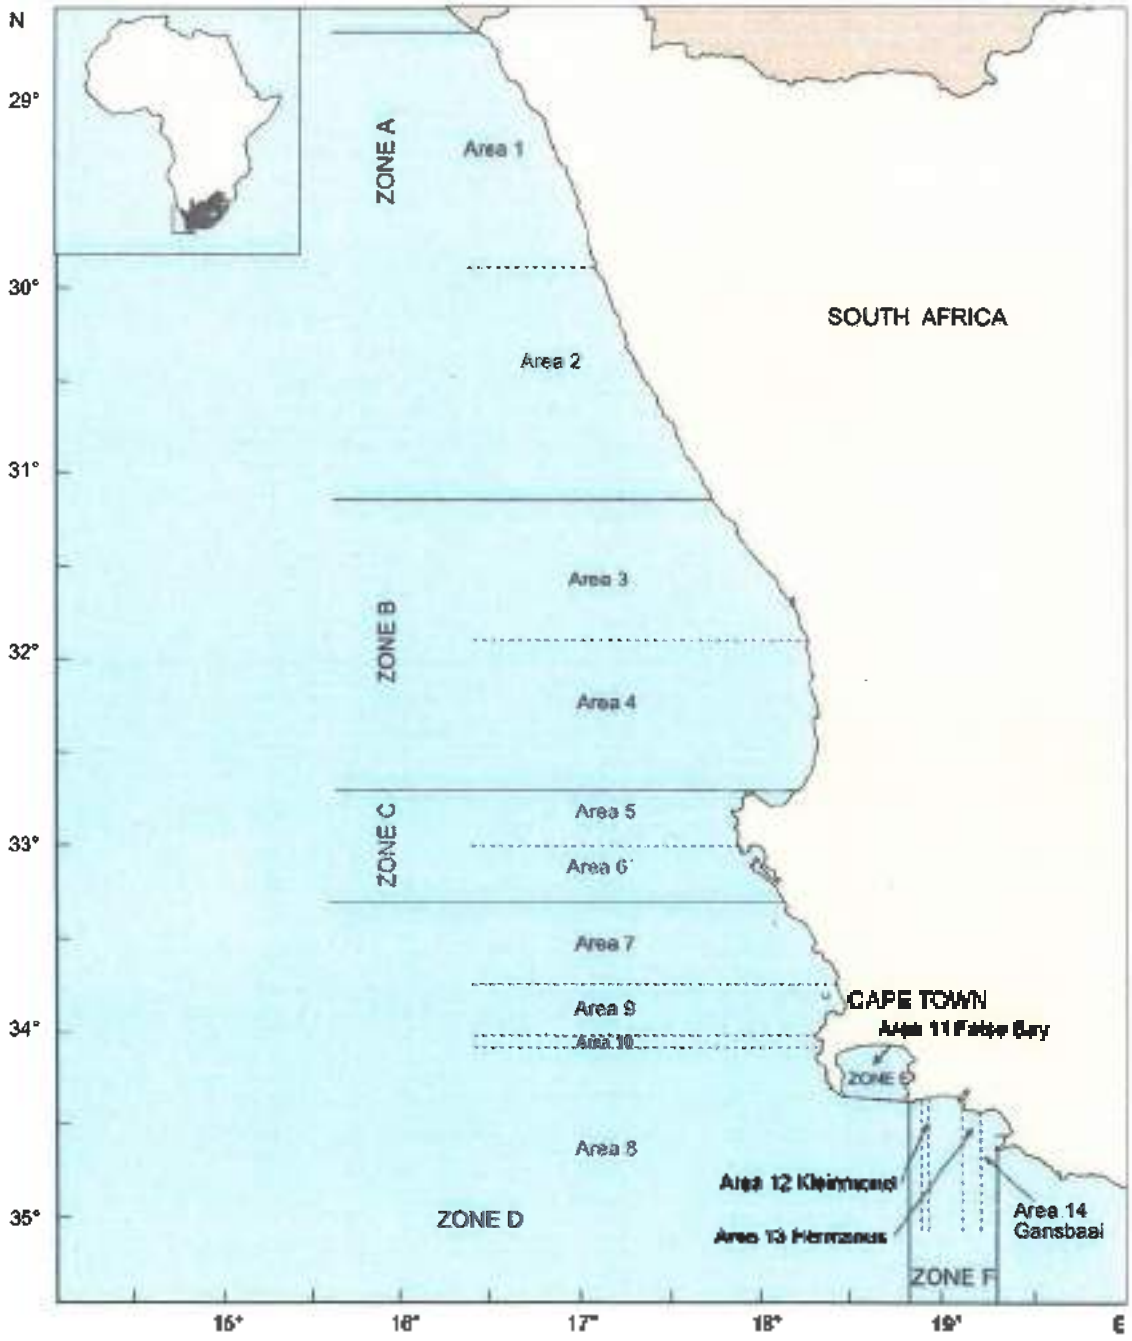

Figure 80: West Coast rock lobster fishing zones and areas. The five super-areas are: areas 1–2, corresponding to zone A; areas 3–4, to zone B; areas 5–6, to zone C; area 7, being the northernmost area within zone D; and area 8+, comprising area 8 of zone D as well as zones E and F.

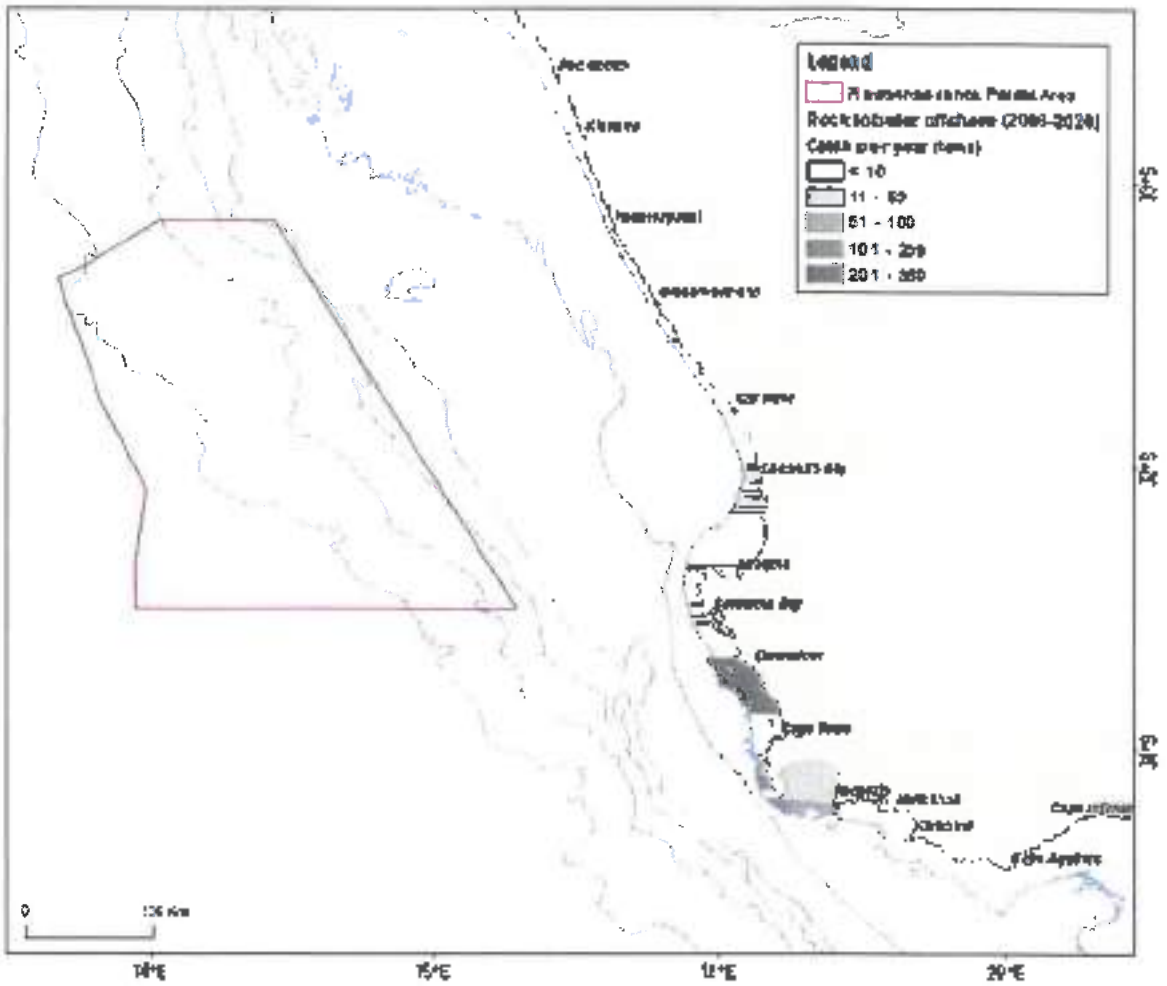

Figure 82: Spatial distribution of fishing effort expended by the west coast rock lobster offshore (trapboat) sector in relation to the Reconnaissance Permit application area.

8.5.3.10 SMALL-SCALE FISHERIES

The concept of Small-Scale Fisheries (SSF)[7] is a relatively new addition to the fisheries complexity in South Africa. The concept has its origin in a global initiative supported by the Food and Agricultural Organisation of the United Nations (FAO). In South Africa, there is a long history of coastal communities utilizing marine resources for various purposes. Many of these communities have been marginalized through apartheid practices and previous fisheries management systems. In 2007 government was compelled through an equality court order to redress the inequalities suffered by these traditional fishers[8]. The development of a SSF sector aims in part to compensate previously disadvantaged fishing communities that have been displaced either politically, economically or by the development of large-scale commercial fisheries. This led to the development of the Small-Scale Fisheries Policy (SSFP), the aim of which is to redress and provide recognition of the rights of small-scale fishers (DAFF, 2015). The SSFP was gazetted in May 2019 under the Marine Living Resources Act, 1998 (Act No. 18 of 1998). It is only now (2021/2022) in an advanced process of implementation. It is a challenging process that has been exacerbated by the conflict and overlap with another fisheries-related process of fishing rights allocations (known as Fishery Rights Allocation Process or "FRAP"). As of February 2022, neither process has been concluded and the issues at stake are highly politicised. The SSF overlaps other historical fisheries in South Africa, leading to legal challenges where the SSF rights allocations are in conflict with other established

[7] In regard to SSF, this assessment is guided by several key documents, namely the Marine Living Resources Act of 1998 (as amended); the Small Scale Fisheries Policy (2016) and in particular the Small Scale Fisheries Regulations of 2016. See also : Small-Scale Policy Implementation Plan available at http://www.smallscalefisheries.co.za/useful-resources

[8] See also the Thesis of Presentus, G. (2022)

JWS

commercial fishing sectors, most notably the commercial squid fishing sector. SSF is defined as a fishery although specific operations and dynamics are not yet fully defined as they are subject to an ongoing process by DFFE. The SSF regulations (DAFF, 2016) do however define the fishing area for SSF as ""near-shore", meaning "the region of sea (including seabed) within close proximity to the shoreline". The regulations further specify under Schedule 5 Small-scale fishing areas and zones in which "5. (1) In order to facilitate the establishment of areas where smallscale fishers may fish, the Department must set up a procedure to engage and consult with the small-scale fishing community in proposing demarcated areas that may be established as areas where small-scale fishers may fish" and which under section 5 (2)b. "take into account the mobility of each species in the allocated basket of species with sessile species requiring smaller fishing areas while nomadic and migratory species requiring larger area".

Small-scale fishers fish to meet food and basic livelihood needs, but may also directly be involved in fishing for commercial purposes[9]. These fishers traditionally operate on nearshore fishing grounds to harvest marine living resources on a full-time, part-time or seasonal basis. Fishing trips are usually of short-duration and fishing/harvesting techniques are labour intensive[10].

Small-scale fishers are an integral part of the rural and coastal communities in which they reside and this is reflected in the socio-economic profile of such communities. In the Eastern Cape, KwaZulu-Natal and the Northern Cape, small scale fishers live predominantly in rural areas while those in the Western Cape live mainly in urban areas (Harris et. al. 2002; Sunde & Pedersen C. 2007; Sunde 2016.).

Many communities living along the coast have, over time, developed local systems of rules to guide their use of coastal lands, forests and waters. These local rules are part of their systems of customary law. Rights to access, use, and own different natural resources arise from local customary systems of law. These systems of law are not written down as in Western law, but are passed down from generation to generation through practice (https://www.masifundise.org/wp-content/uploads/2011/06/vissernet-eng-news-3-final.pdf). South Africa's Constitution recognises customary law together with common law and state law. Section 39 (3) makes provision for a community that has a system of customary rights arising from customary law to be recognised as long as these rights comply with the Bill of Rights. In line with this, the SSFP also recognises rights arising in terms of customary law. Customary fishers are normally associated with discrete groups (tribes or communities with unique identities and associations with the sea) who may be defined by traditions and beliefs (see also Pretorius, 2022). These traditions are increasingly being challenged as stocks and marine resources have been depleted. This would include, for example, intertidal harvesting of seaweed, mussels, oysters, cephalopods and virtually any species available to these communities. These fishers are generally localised and do not range far beyond the areas in which they live[11].

SSF resources are managed in terms of a community-based co-management approach that aims to ensure that harvesting and utilisation of the resource occurs in a sustainable manner in line with the ecosystems approach. The SSF is to be implemented along the coast in series of community co-operatives. Only a co-operative is deemed to be a suitable legal entity for the allocation of small-scale fishing rights[12]. Applicants for small-scale fishing rights must have a historical involvement in traditional fishing operations, including the catching, processing or marketing of fish for a cumulative period of at least 10 years. They also need to show a historical dependence on deriving the major part of their livelihood from traditional fishing operations.

---

[9] There is no formal designation of artisanal (or traditional/subsistence) fishing in South Africa, which is generally considered as fishing or resource extraction for own use. As fisheries have evolved and the commercial benefits realised, subsistence fishers have increasingly moved to commercialisation aimed at supporting their livelihoods. This group can now, therefore, also include shore and boat-based anglers and spear-fishers who target a wide range of line fish species, some of which are also targeted by commercial operations, skin divers who collect rock lobsters and other subtidal invertebrates, bait collectors (mussels, limpets, red bait) and non-subsistence collectors of intertidal organisms. The high value of many intertidal and subtidal resources (e.g. rock lobster, abalone and mussels) has resulted in an increase in their production through aquaculture and small-scale harvesting in recent years (Clark et. al. 2010).

[10] The equipment used by small scale fishers includes rowing boats in some areas, motorised boats on the south and west coast and simple fishing gear including hands, feet, screw drivers, hand lines, prawn pumps, rods with reels, gaffs, hoop nets, gill nets, seine/beach nets and semi-permanently fixed legal traps.

[11] It can include foot-fishers, but also boat fishers who may have difficult or restricted options for launching sites. Note that in some areas fishers are increasingly using more sophisticated technology such as fish finders and larger motorised boats. This ability means their activities may be increasingly commercialised and may overlap with more established commercial fishery sectors.

[12] A co-operative is jointly owned and democratically controlled by small-scale fishers.

More than 270 communities have registered an Expressions of Interest (EOI) with the Department. DFFE has split SSF by communities into district municipalities and local municipalities. The location of these coastal communities and the number of fishers per community are shown in Figure 3.41.

- In the Northern Cape, there are 103 fishers registered in the Namakwa district, comprising the Richtersveld and Kamiesberg local municipalities.
- Western Cape districts include 1) West Coast (Berg River, Saldanha Bay, Cederberg, Matzikama and Swartland local municipalities; 2) Cape Metro; 3) Overberg (Overstrand and Cape Agulhas); and 4) Eden (Knysna, Bitou and Hessequa). In total there are 1748 fishers registered in the province.
- In the Eastern Cape, the communities are again split up, broadly as 1) Nelson Mandela Bay, 2) Sarah Baartman, 3) Buffalo City, 4) Amathole, 5) O.R. Tambo and 6) Alfred Nzo. There are 5154 fishers registered in the province.
- KwaZulu-Natal has 2008 registered small-scale fishers divided by district into 1) Ugu, 2) Ethekwini Metropolitan, 3) Iembe, 4) King Shwatshayo/Uthungulu, and 5) Umkhanyakude.

Approximately 10 000 small-scale fishers have been identified around the coast. The licence block is situated offshore of the West Coast, City of Cape Town and Overberg municipal districts. Between Saldanha Bay and Cape Agulhas, 68 communities have been registered for small-scale fishing rights, these co-operatives comprise a total of 2031 fishers. At this point in time, no discreet co-operatives are active, except for on the West Coast in Port Nolloth.

The SSFP requires a multi-species approach to allocating rights, which enable the allocation of rights for a basket of species that may be harvested or caught within particular designated areas[13]. Section 6 of the regulations covers access Management of the rights of access and includes amongst other parts

Co-operatives can only request access to species found in their local vicinity. DFFE recommends five basket areas: 1. Basket Area A – The Namibian border to Cape of Good Hope – 57 different resources 2. Basket Area B – Cape of Good Hope to Cape Infanta – 109 different resources 3. Basket Area C – Cape Infanta to Tsitsikamma – 107 different resources 4. Basket Area D – Tsitsikamma to the Pondoland MPA – 138 different resources 5. Basket Area E – Pondoland MPA to the Mozambican border – 127 different resources.

The mix of species to be utilised by small-scale fishers includes species that are exploited nearshore by existing commercial sectors viz; traditional linefish, west coast rock lobster, squid, hake handline[14], abalone, KZN beach seine, netfish (gillnet and beach-seine), seaweed and white mussel. An apportionment of TAE/TACs for these species will be transferred from existing commercial rights to SSF[15], whereas white mussels will become the exclusive domain of SSF. Species nominated for commercial use will be subject to TAE and/or TAC allocation. Species nominated for own use will be available to all members of a particular co-operative, but subject to output controls.

The small-scale fishery rights cover the nearshore area (defined in section 19 of the MLRA as being within close proximity of shoreline). Small-scale fishermen along the Northern Cape and Western Cape coastlines are typically involved in the traditional line, west coast rock lobster and abalone fisheries, whereas communities on the South Coast would be involved in traditional line, squid jig and oyster harvesting. The small-scale communities on the West Coast, with long family histories of subsistance fishing, prioritise the harvest of nearshore resources (using boats) over the intertidal and subtidal resources (Clark, Hauck *et al.* 2002, Harris, Salo, & Russell 2010).

Snoek (*Thyrsites atun*), Cape bream / hottentot (*Pachymetopon blochii*) and yellowtail (*Seriola lalandi*) are important linefish species that are targeted by small-scale fishers operating nearshore along the West and

[13] Under the SSF regulations the species that may be included in the "basket" are provided in Annexures 2, 3 & 4 that includes fish species that are listed on the non-saleable list, and those that it shall only be caught for own consumption within the corresponding limits.

[14] Hake handline is a small subsector of the hake fishery and requires a fishing right apportionment. The fishery has in recent years not been active because of resource availability. It is perceived as having potential for allocation as part of the SSF and as part of their "basket".

[15] DFFE proposes that, commencing January 2021, 50% of the overall TAE and TAC for the traditional linefish and abalone sectors, respectively, will be apportioned to small-scale fishing whereas 25% of the overall TAE for squid will be apportioned to small-scale fishing (DFFF 2020).

JW3

South-West Coast of South Africa. Snoek are targeted by small-scale fishers during the snoek seasonal migration between April and June, during which time they shoal nearshore and are therefore available to handline fishermen[16]. Snoek availability coincides with peaks in the availability of other small pelagic species, notably anchovy and sardine (Nepgen, 1979). As shown by Crawford *et al.* (1987) [17,18] snoek stay inshore on their southward migration (i.e. April through to June and then move offshore into deeper waters to spawn[18] in July and August (and are not available to line fishers).

Small-scale fishers also target west coast rock lobster (Jasus lalandii) using hoopnets set by small "bakkies" on suitable reefs at a water depth of less than 30 m. Fishing activity may range up to 100 m water depth by the larger vessels that participate in the offshore commercial rock lobster trap sector.

Small-scale fishermen along the Northern Cape and Western Cape coastlines are unlikely to range beyond 20 km from the coastline; thus, inshore of the Reconnaissance Permit area (refer to

Figure 83). This assessment is however cognisant of the ongoing issues related to the perceived areas fished and species targeted by SSF off the West Coast of South Africa[20] e.g. that cultural practice of SSF may occur to 55 km offshore. While SSF regulations clearly specify that fishing is required to take place "nearshore" the actual differentiation between SSF and other fishing operations that might include SSF, such as the commercial "traditional linefish" and "pole and line" and the extent to which these commercial fisheries might include SSF, remains unclear. As such the offshore extent to which SSF may operate requires a precautionary approach in this assessment and consideration that the possibility exists (albeit a remote possibility that cannot be verified through the information made available on these fisheries), that SSF may have occurred historically and potentially in the future further offshore than suggested by the information made available for this assessment i.e. there is a remote possibility that some SSF may have targeted certain species (of which tuna and snoek are the main candidate species) further offshore than 20 km. The distance fished offshore by SSF and the associated risks determined in this assessment further necessarily considers practical aspects, notably that bottom fishing is impractical in waters deeper than 100 m and as such any bottom fishing, whether SSF or commercial, is highly unlikely beyond a precautionary depth being the 100 m depth contour. Further, in regard to migratory species, such as longfin tuna and snoek, economic and regulatory aspects relating to distances fished offshore is pertinent (i.e. such as the requirements of the South African Maritime Safety Authority (SAMSA)) in particular that most SSF are not likely to be "B" class certified (i.e. can operate up to 40 nm offshore and are longer than 9 m) are likely limited to "C" class being mainly vessels of <9 m[21] permitted to only operate < 15 nm offshore.

---

[16] Snoek are known to undertake migrations in a southward direction from the waters of the northern Benguela into the southern Benguela towards the cape west and southern coasts. These migrations have certainly been long taken advantage of by fishers, including traditional linefishers and commercials along the west coast. Commercial fishers as well as the Small Scale Fishery (SSF) sector capitalise on the inshore availability, but this opportunity is lost once the snoek move offshore in mid-winter and start their northward migration. Snoek are primarily a "winter" fish, moving systematically southwards in autumn and commercial linefish, recreational and community-based boats exploit this shoaling species mostly in the nearshore. Snoek are also caught by the hake trawl fleets in significant numbers at times as snoek may undertake diurnal migrations feeding or spawning in deeper waters (and are not accessible to surface line fishers or these times). There is however no definitive description of snoek migrations with regard to their exact spatial and temporal movements.

[17] The Benguela ecosystem : Part IV. pgs 488

[18] See also Nepgen (1979) in Fish. Bull. S Afr. 12:35-43

[18] Snoek spawning occurs offshore during winter-spring, along the shelf break (150-600 m) of the western Agulhas Bank and the South African west coast. Prevailing currents transport eggs and larvae to a primary nursery ground north of Cape Columbine and to a secondary nursery area to the east of Danger Point; both shallower than 150 m. Juveniles remain on the nursery grounds until maturity, growing to between 38 and 44 cm in the first year (3.25 cm/month). Onshore-offshore distribution (between 5- and 150-m isobaths) of juveniles is determined largely by prey availability and includes a seasonal inshore migration in autumn in response to clupeoid recruitment. Adults are found throughout the distribution range of the species, and although they move offshore to spawn - there is some southward dispersion as the spawning season progresses - longshore movement is apparently random and without a seasonal basis (Griffiths, 2002).

[20] On 22/08/22 the Western Cape High Court ruled that the process of designating SSF in the Western Cape had been "unlawful" and had to be redone.

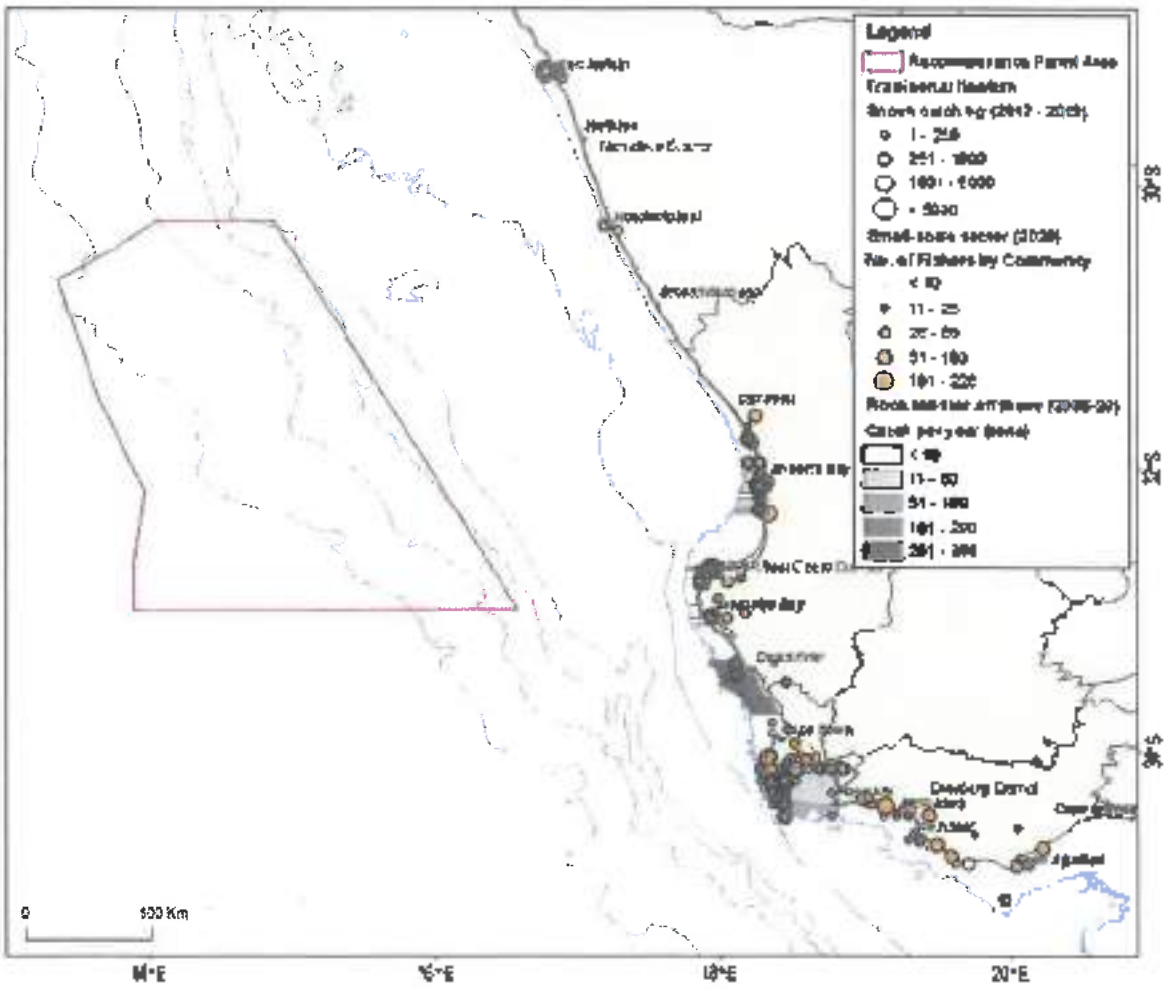

Figure 83: Overview of spatial distribution of small-scale fishing communities and number of participants per community along the South African west coast. The location of snoek catches reported by the linefish sector for the period 2017 to 2019 are shown.

8.5.3.21 BEACH-SEINE AND GILLNET FISHERIES (NETFISH)

There are a number of active beach-seine and gillnet operators throughout South Africa (collectively referred to as the "netfish" sector). Initial estimates indicate that there are at least 7 000 fishermen active in fisheries using beach-seine and gillnets, mostly (86%) along the West and South coasts. These fishermen utilise 1 373 registered and 458 illegal nets and report an average catch of about 1 600 tons annually, constituting 60% harders (also known as mullet, *Chelon richardsonii*), 10% St Joseph shark (*Callorhinchus capensis*) and 30% "bycatch" species such as galjoen (*Dichistius capensis*), yellowtail (*Seriola lalandi*) and white steenbras (*Lithognathus lithognathus*). Catch-per-unit-effort declines eastwards from 294 and 115 kg-net-day-1 for the beach-seine and gill-net fisheries respectively off the West Coast to 48 and 5 kg-net-day-1 off KwaZulu-Natal. Consequently, the fishery changes in nature from a largely commercial venture on the West Coast to an artisanal/subsistence fishery on the East Coast (Lamberth *et al.* 1997).

The fishery is managed on a Total Allowable Effort (TAE) basis with a fixed number of operators in each of 15 defined areas (see Table 27 for the number of rights issued and Figure 84 for the fishing areas). The number of Rights Holders operating on the West Coast from Port Nolloth to False bay is listed as 28 for beach-seine and 162 for gillnet (DEFF, 2020). Permits are issued solely for the capture of harders, St Joseph and species that appear on the 'bait list'. The exception is False Bay, where Right Holders are allowed to target linefish species that they traditionally exploited.

Table 27: Recommended Total Allowable Effort (TAE, number of rights and exemption holders) and rights allocated in 2016-17 for each netfish area. Levels of effort are based on the number of fishers who could maintain a viable income in each area (DAFF 2017).

Area	Locality	Beach-seine	Gill/drift	Total	Rights allocated
A	Port Nolloth	3	4	7	4

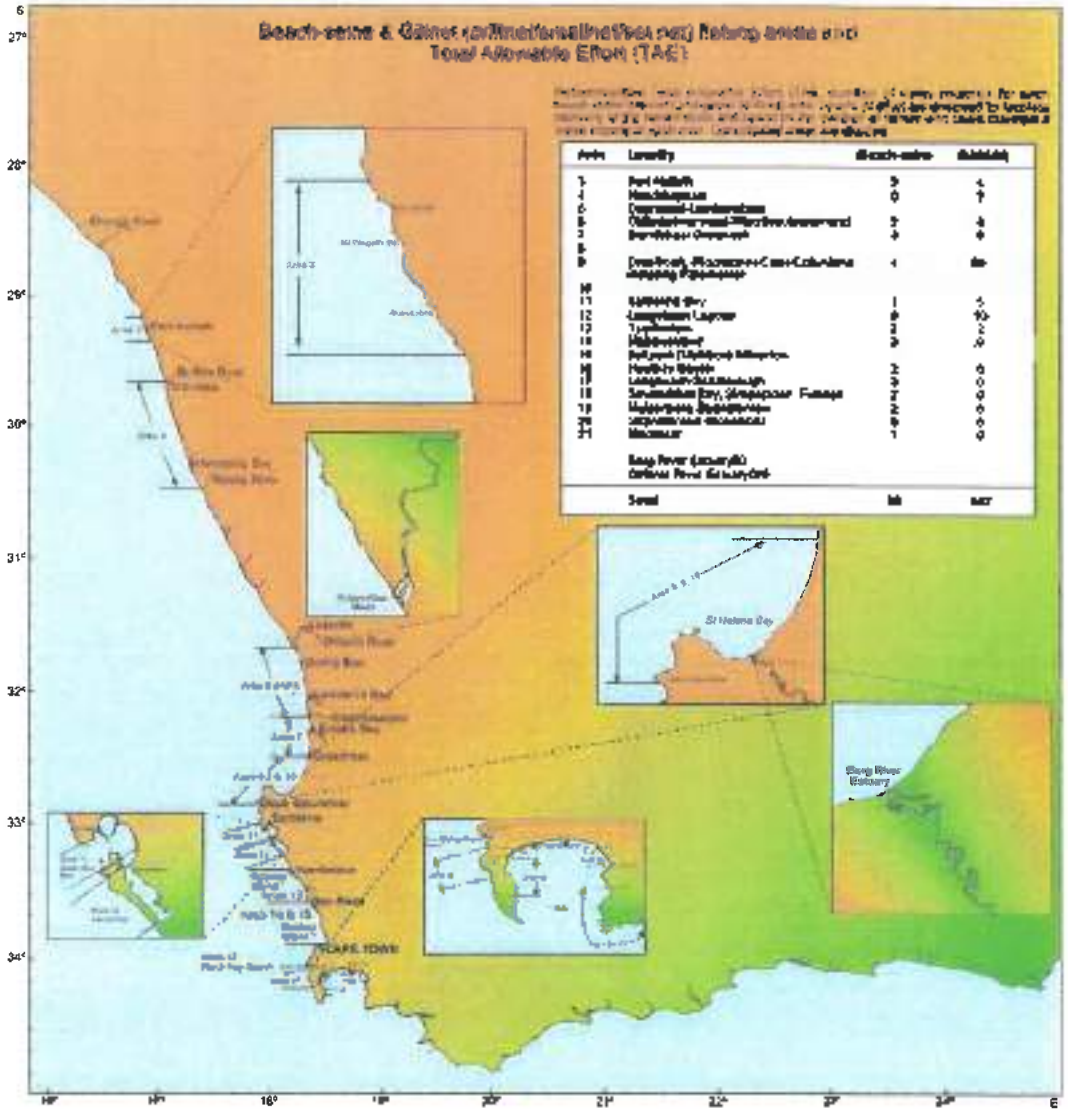

Figure 84: Beach-seine and gillnet fishing areas and TAE (DAFF, 2014)

The beach-seine fishery operates primarily on the West Coast of South Africa between False Bay and Port Nolloth (Lamberth 2006) with a few permit holders in KwaZulu-Natal targeting mixed shoaling fish during the annual winter migration of sardine (Fréon *et al.* 2010). Beach-seining is an active form of fishing in which woven nylon nets are rowed out into the surf zone to encircle a shoal of fish. They are then hauled shorewards by a crew of 6–30 persons, depending on the size of the net and length of the haul. Nets range in length from 120 m to 275 m. Fishing effort is coastal and net depth may not exceed 10 m (DAFF 2014b).

The gillnet fishery operates from Yzerfontein to Port Nolloth on the West Coast. Surface-set gillnets (targeting mullet) are restricted in size to 75 m x 5 m and bottom-set gillnets (targeting St Joseph shark) are restricted to 75 m x 2.5 m (da Silva *et al.* 2015) and are set in waters shallower than 50 m. The spatial distribution of effort is represented as the annual number of nets per kilometre of coastline.

The range of gillnets (50 m) and that of beach-seine activity (20 m) will not overlap with Reconnaissance Permit area. Figure 85 shows the expected range of gillnet fishing activity off the west coast of South Africa, situated at least 220 km from the Reconnaissance Permit area.

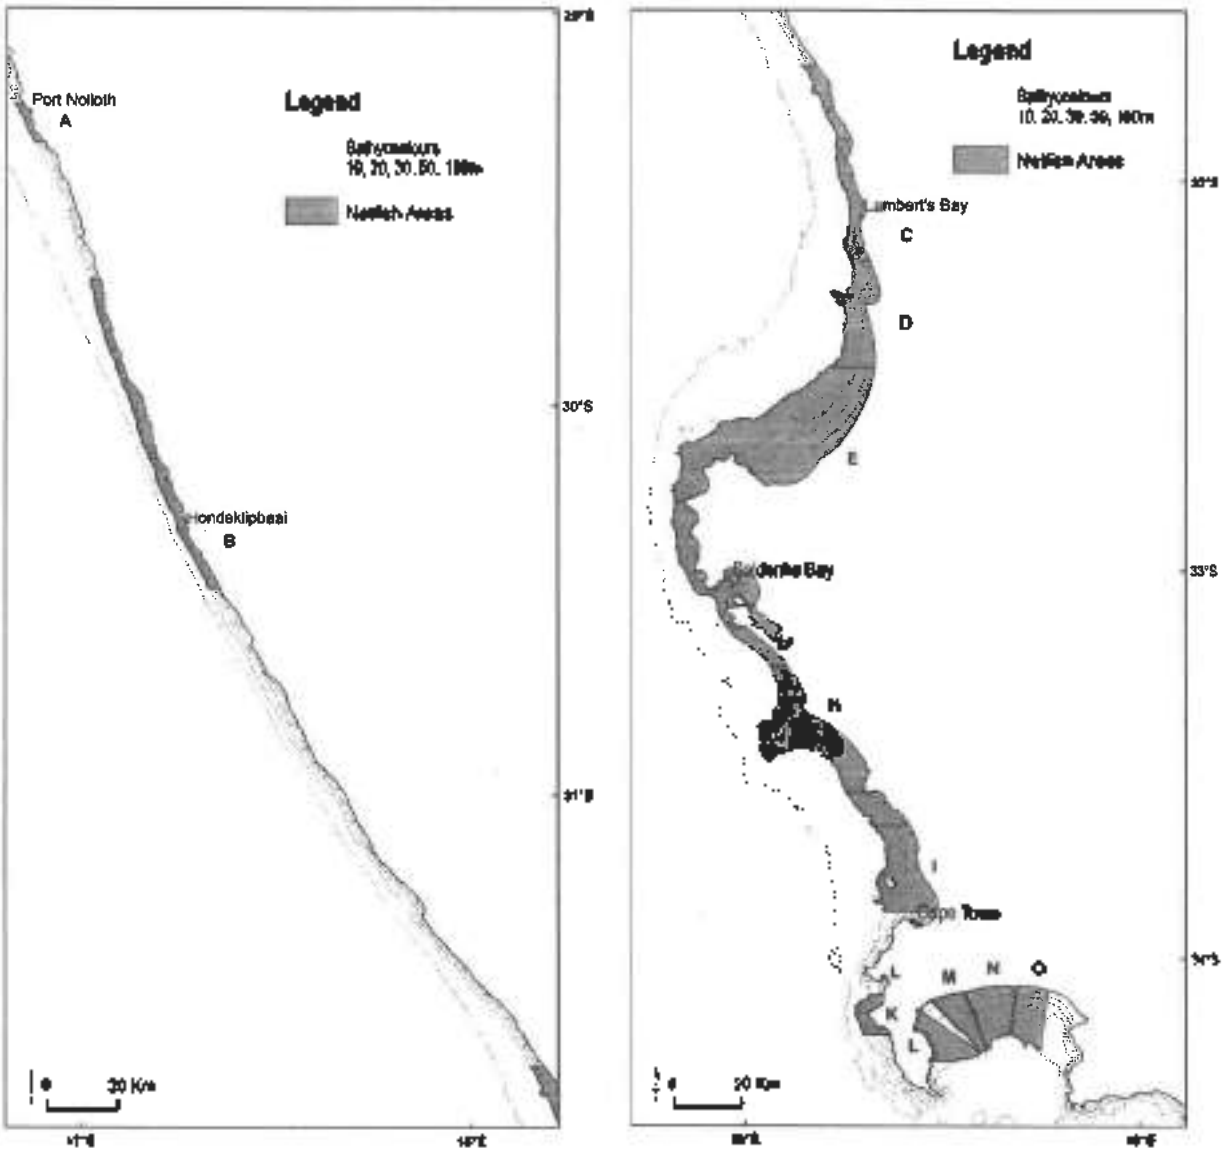

Figure 85: Netfish (gillnet and beach-seine) fishing areas (DAFF, 2016/17)

8.5.3.12 FISHERIES RESEARCH

Swept-area trawl surveys of demersal fish resources are carried out twice a year by DAFF in order to assess stock abundance. Results from these surveys are used to set the annual TACs for demersal fisheries. First started in 1965, the West Coast survey extends from Cape Agulhas (20°E) to the Namibian maritime boarder and takes place over the duration of approximately one month during January/February. The survey of the Southeast coast (20°E – 27°E longitude) takes place in April/May. Following a stratified, random design, bottom trawls are conducted to assess the biomass, abundance and distribution of hake, horse mackerel, squid and other demersal trawl species on the shelf and upper slope of the South African coast. Trawl positions are randomly selected to cover specific depth strata that range from the coast to the 1 000 m isobath. On occasion, trawls are targeted in waters deeper than 1 000 m. Figure 86 shows the distribution of research trawls undertaken in relation to the Reconnaissance Permit area, with several deepwater trawls having been undertaken within the area.

The biomass of small pelagic species is assessed bi-annually by an acoustic survey. The first of these surveys is timed to commence in mid-May and runs until mid-June while the second starts in mid-October and runs until mid-December. The timing of the demersal and acoustic surveys is not flexible, due to restrictions with availability of the research vessel as well as scientific requirements. During these surveys the survey vessels

FCDS

travel pre-determined transects (perpendicular to bathymetric contours) running offshore from the coastline to approximately the 200 m isobaths, but selected transect run to the to 1 000 m contour in places. The surveys are designed to cover an extensive area from the Orange River on the West Coast to Port Alfred on the East Coast and the DFFE survey vessel progresses systematically from the Northern border Southwards, around Cape Agulhas and on towards the east. Figure 86 shows the research effort undertaken off the West Coast during the November 2020 spawner biomass survey and May 2021 recruitment survey of small pelagic species. The Reconnaissance Permit area is situated at least 60 km offshore of the deepwater extent of research survey transects and there is no spatial overlap expected.

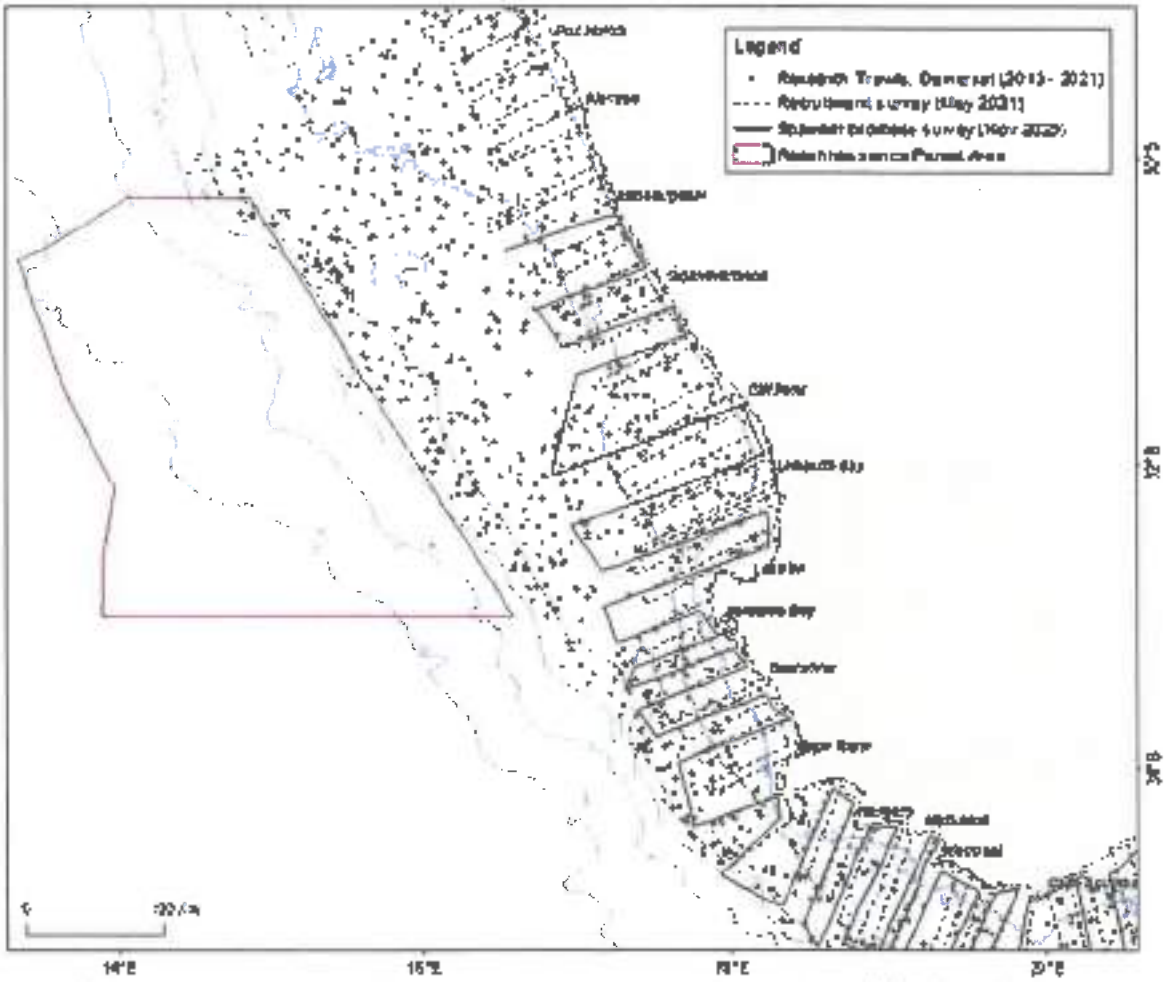

Figure 86: Spatial distribution of trawl start positions undertaken by DFFE from 2013 to 2021 to assess the biomass of demersal fish species along the West Coast. Also shown are the survey transects of recruitment and spawner biomass research surveys undertaken by DFFE in May 2021 and November 2020, respectively, in relation to the Reconnaissance Permit application area.

8.5.4 SUMMARY OF SEASONALITY IN FISHERIES

The seasonality of each of the main commercial fishing sectors that operate off the west coast (west of 20°E) of South Africa is indicated in Table 3.13. Fishing intensity within the Reconnaissance Permit application area is presented for each sector in Table 3.14.

Table 28: Summary table showing seasonal variation in fishing effort expended by each of the main commercial fisheries sectors operating off the West Coast of South Africa.

8.6 OTHER USES OF THE AREA

This section provides a description of the other uses of the application area. The information has been sourced from the Marine Ecological Study undertaken by Pisces Environmental Services (Pty) Ltd included in Appendix 3.

8.6.1 BENEFICIAL USES

The Application Area is located well offshore beyond the 1 000 m depth contour. Other users of the offshore areas include the commercial fishing industry (see CapMarine 2022 – Fisheries Specialist Study), with marine diamond mining concessions being located well inshore of the eastern portion of the Reconnaissance Permit Area (Figure 88). Recreational activities along the coastline north of St Helena Bay are limited to the area around Lambert's Bay, Hondeklip Bay and Port Nolloth.

On the Namaqualand coast marine diamond mining activity is restricted to nearshore, diver-assisted operations from small, converted fishing vessels working in the a-concessions, which extend to 1 000 m offshore of the high-water mark. No deep-water diamond mining is currently underway in the South African offshore concession areas, although prospecting activities are ongoing. In Namibian waters, deep-water diamond mining by De Beers Marine Namibia is currently operational in the Atlantic 1 Mining Licence Area, immediately to the northeast of the Reconnaissance Permit Area.

These mining operations are typically conducted to depths of 150 m from fully self-contained mining vessels with on board processing facilities, using either large-diameter drill or seabed crawler technology. The vessels operate as semi-mobile mining platforms, anchored by a dynamic positioning system, commonly on a three to four anchor spread (Figure 87). Computer-controlled positioning winches enable the vessels to locate themselves precisely over a mining block of up to 400 m x 400 m. These mining vessels thus have limited manoeuvrability and other vessels should remain at a safe distance.

Other industrial uses of the marine environment include the intake of feedwater for mariculture, or diamond-gravel treatment, submarine telecommunications cables, ammunition dumps and hydrocarbon wellheads (Figure 88). None of these activities should in any way be affected by 3D seismic survey activities offshore.

Figure 87: Typical crawler-vessel (left) and drillship (right) operating in the Atlantic 1 Mining Licence Area (Photos: De Beers Marine).

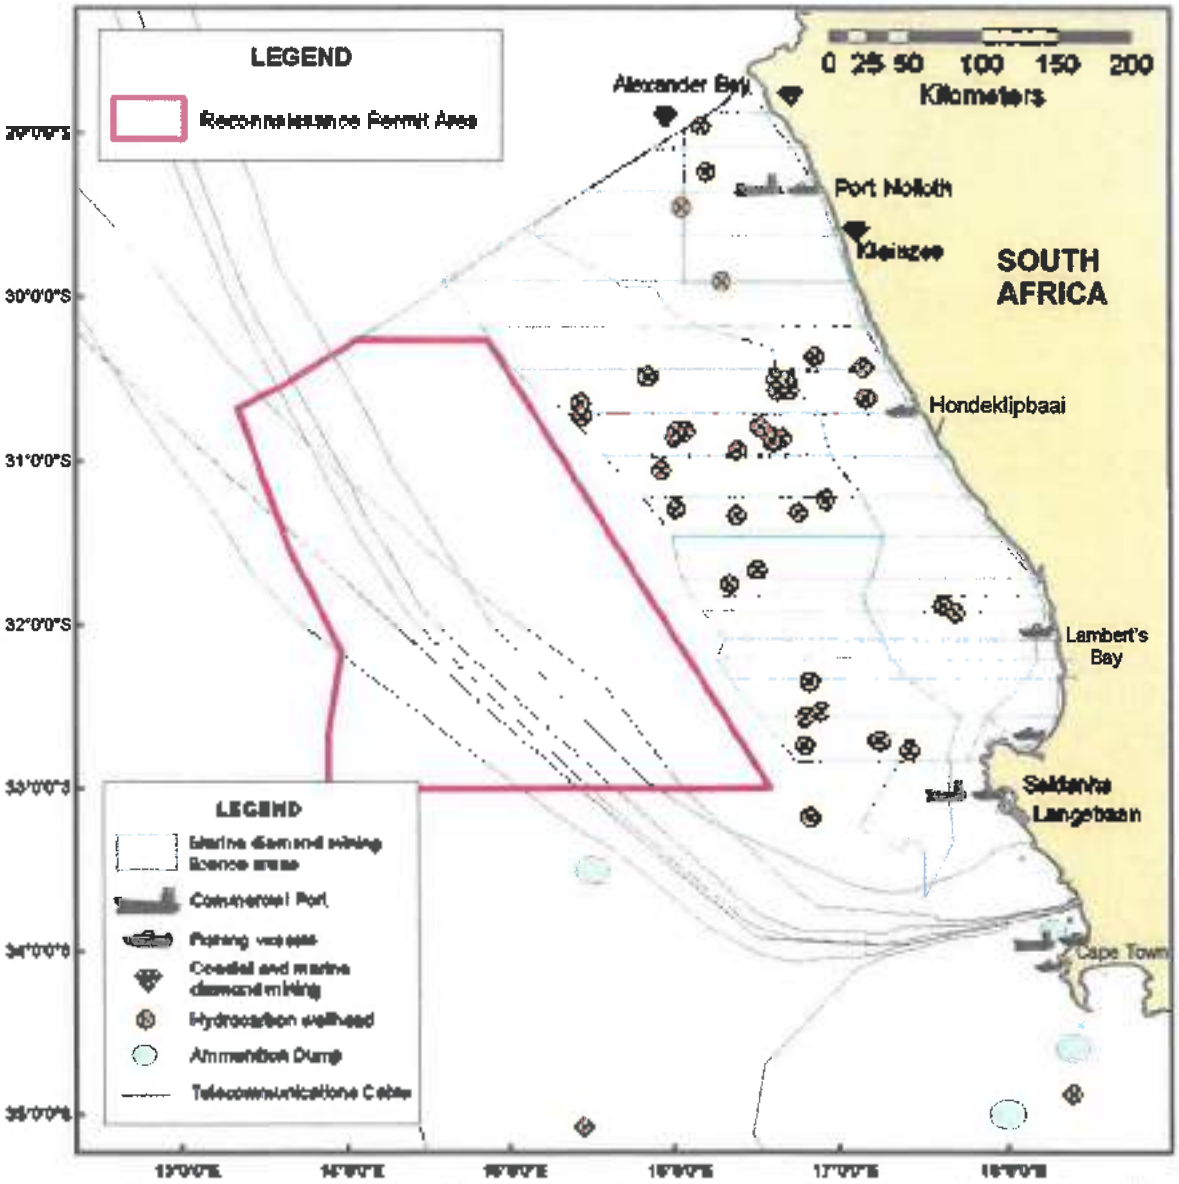

Figure 68: The Reconnaissance Permit Area (red polygon) in relation to project - environment interaction points on the West Coast, illustrating the location of marine diamond mining concessions and ports for commercial and fishing vessels. Existing hydrocarbon wellheads, telecommunications cables and ammunition dumps are also shown.

8.6.2 CONSERVATION AREAS AND MARINE PROTECTED AREAS

Numerous sanctuaries, marine protected area (MPA) exist offshore and along the coastline of the West coast, although none of them overlap with the Reconnaissance Permit Area. For the sake of completeness, these are described in more detail below.

8.6.2.1 SANCTUARIES

Sanctuaries are considered a type of management area within South Africa's multi-purpose expanded MPA network in which access and/or resource use is prohibited. Sanctuaries in the vicinity of the project area in which restrictions apply are the McDougall's Bay, Stompneusbaai, Saldanha Bay, Table Bay and Hout Bay rock lobster sanctuaries, which are closed to commercial exploitation of rock lobsters. These sanctuaries were originally proclaimed early in the 20th century under the Sea Fisheries Act of 1988 as a management tool for the protection of the West Coast rock lobster (Mayfield *et al.* 2005). They lie well inshore or to the south of the Reconnaissance Permit Area.

8.6.2.2 **MARINE PROTECTED AREAS**

'No-take' MPAs offering protection of the Namaqua biozones (sub-photic, deep-photic, shallow-photic, intertidal and supratidal zones) are absent northwards from Cape Columbine (Emanuel *et al.* 1992, Lombard *et al.* 2004). This resulted in substantial portions of the coastal and shelf-edge marine biodiversity in the area being assigned a threat status of 'Critically Endangered', 'Endangered' or 'Vulnerable' in the 2011 National Biodiversity Assessment (NBA) (Lombard *et al.* 2004; Sink *et al.* 2012). Using biodiversity data mapped for the 2004 and 2011 NBAs a systematic biodiversity plan was developed for the West Coast (Majiedt *et al.* 2013) with the objective of identifying both coastal and offshore priority areas for MPA expansion. Potentially vulnerable marine ecosystems (VMEs) that were explicitly considered during the planning included the shelf break, seamounts, submarine canyons, hard grounds, submarine banks, deep reefs and cold water coral reefs. To this end, nine focus areas were identified for protection on the West Coast between Cape Agulhas and the South African – Namibian border. These focus areas were carried forward during Operation Phakisa, which identified potential offshore MPAs. A network of 20 MPAs was gazetted on 23 May 2019, thereby increasing the ocean protection within the South African Exclusive Economic Zone (EEZ) to 5%. The approved MPAs within the broad project area are shown in Figure 89. There are six offshore Marine Protected Areas (MPAs) that fall within the broader project area, namely the Orange Shelf Edge MPA, Child's Bank MPA, Benguela Muds MPA, Cape Canyon MPA, Robben Island MPA and the Southeast Atlantic Seamounts MPA. These are described briefly below.

The **Orange Shelf Edge MPA** covers depths of between 250 m and 1 500 m and is unique as it has to date never been trawled. Proclaimed in 2019, this MPA provides a glimpse into what a healthy seabed should look like, what animals live there and how the complex relationships between them support important commercial fish species such as hake, thereby contributing fundamentally towards sustainable fisheries development. This MPA also protects the pelagic habitats that are home to predators such as blue sharks, as well as surface waters where thousands of seabirds such as Atlantic yellow-nosed albatrosses feed. The MPA lies ~10 km to the north of the northern boundary of the Reconnaissance Permit Area.

The 1 335 km^2 **Child's Bank MPA**, located 27 km inshore of the Reconnaissance Permit Area at its closest point, supports seabed habitats inhabited by a diversity of starfish, brittle stars and basket stars, many of which feed in the currents passing the bank's steep walls. Although trawling has damaged coral in the area, some pristine coral gardens remain on the steepest slopes. The Child's Bank area was first proposed for protection in 2004 but was only proclaimed in 2019, after reducing its size to avoid petroleum wellheads and mining areas. The MPA provides critical protection to these deep sea habitats (180 - 450 m) as they allow for the recovery of important nursery areas for young fish.

The **Benguela Muds MPA** is the smallest of the South African offshore MPAs. At only 72 km^2 the muddy habitats located in this area are created by sediment washed down the Orange River and out to sea. These mud habitats are of limited extent and were considered 'critically endangered' on South Africa's deep continental margin of the west coast (Sink *et al.* 2014). The MPA represents the least trawled stretch of muddy seabed on the west coast. This MPA is located 28 km east of the southern portion of the Reconnaissance Permit Area.

The **Cape Canyon** is a deep and dramatic submarine canyon carved into the continental shelf and extending to a maximum depth of 3,600 m. The 580 km^2 MPA was proclaimed in 2019 and protects the upper part of the canyon where depths range from 180 to 500 m. Underwater footage has revealed a rich diversity of sea fans, hermit crabs and mantis shrimps, with hake, monk and John dory resident on the soft canyon floor. Rocky areas in the west of the canyon support fragile rocky habitat, but the area also includes sandy and muddy habitats, which have been trawled in the past. Interaction of nutrient-rich bottom water with a complex seascape results in upwelling, which in turn provides productive surface waters in which seabirds, humpback whales and Cape fur seals feed. The MPA lies 78 km east of the south-eastern corner of the Reconnaissance Permit Area.

The **Namaqua Fossil Forest MPA**, which lies ~173 km inshore of the Reconnaissance Permit Area, provides evidence of age-old temperate yellowwood forests from a hundred million years ago when the sea-level was more than 200 m below what it is today; trunks of fossilised yellowwood trees covered in delicate corals. These unique features stand out against surrounding mud, silt and gravel habitats. The fossilized trees are not known to be found anywhere else in our oceans and are valuable for research into past climates. In 2014 this area was recognised as globally important and declared as an Ecologically and Biologically Significant Area (EBSA). The 1 200 km^2 MPA protects the unique fossil forests and the surrounding seabed ecosystems and including a new species of sponge previously unknown to science.

The **Namaqua National Park MPA** provides the first protection to habitats in the Namaqua bioregion, including several 'critically endangered' coastal ecosystem types. The area is a nursery area for Cape hakes, and the coastal areas support kelp forests and deep mussel beds, which serve as important habitats for the West Coast rock lobster. This 500 km² MPA was proclaimed in 2019, both to boost tourism to this remote area and to provide an important baseline from which to understand ecological changes (e.g. introduction of invasive alien marine species, climate change) and human impacts (harvesting, mining) along the West Coast. Protecting this stretch of coastline is part of South Africa's climate adaptation strategy.

The 612 km² **Robben Island MPA** was proclaimed in 2019 to protect the surrounding kelp forests - one of the few areas that still support viable stocks of abalone. The island harbours the 3rd largest penguin colony, with the breeding population peaking in 2004 at 8 524, but declining since. The island also holds the largest numbers of breeding Bank Cormorant in the Western Cape (120 pairs in 2000) and significant populations of Crowned Cormorant, African Black Oystercatcher (85 breeding pairs in 2000), Hartlaub's Gull and Swift Tern.

The **Rocher Pan MPA**, which stretches 500 m offshore of the high water mark of the adjacent Rocher Pan Nature Reserve, was declared in 1966. The MPA primarily protects a stretch of beach important as a breeding area to numerous waders.

The **West Coast National Park**, which was established in 1985 incorporates the Langebaan Lagoon and Sixteen Mile Beach MPAs, as well the islands Schaapen (29 ha), Marcus (17 ha), Malgas (18 ha) and Jutten (43 ha). Langebaan Lagoon was designated as a Ramsar site in April 1988 under the Convention on Wetlands of International Importance especially as Waterfowl Habitat. The lagoon is divided into three different utilization zones namely: wilderness, limited recreational and multi-purpose recreational areas. The wilderness zone has restricted access and includes the southern end of the lagoon and the inshore islands, which are the key refuge sites of the waders and breeding seabird populations respectively. The limited recreation zone includes the middle reaches of the lagoon, where activities such as sailing and canoeing are permitted. The mouth region is a multi-purpose recreation zone for power boats, yachts, water-skiers and fishermen. However, no collecting or removal of abalone and rock lobster is allowed. The length of the combined shorelines of Langebaan Lagoon MPA and Sixteen Mile Beach is 66 km. The uniqueness of Langebaan lies in its being a warm oligotrophic lagoon, along the cold, nutrient-rich and wave exposed West Coast.

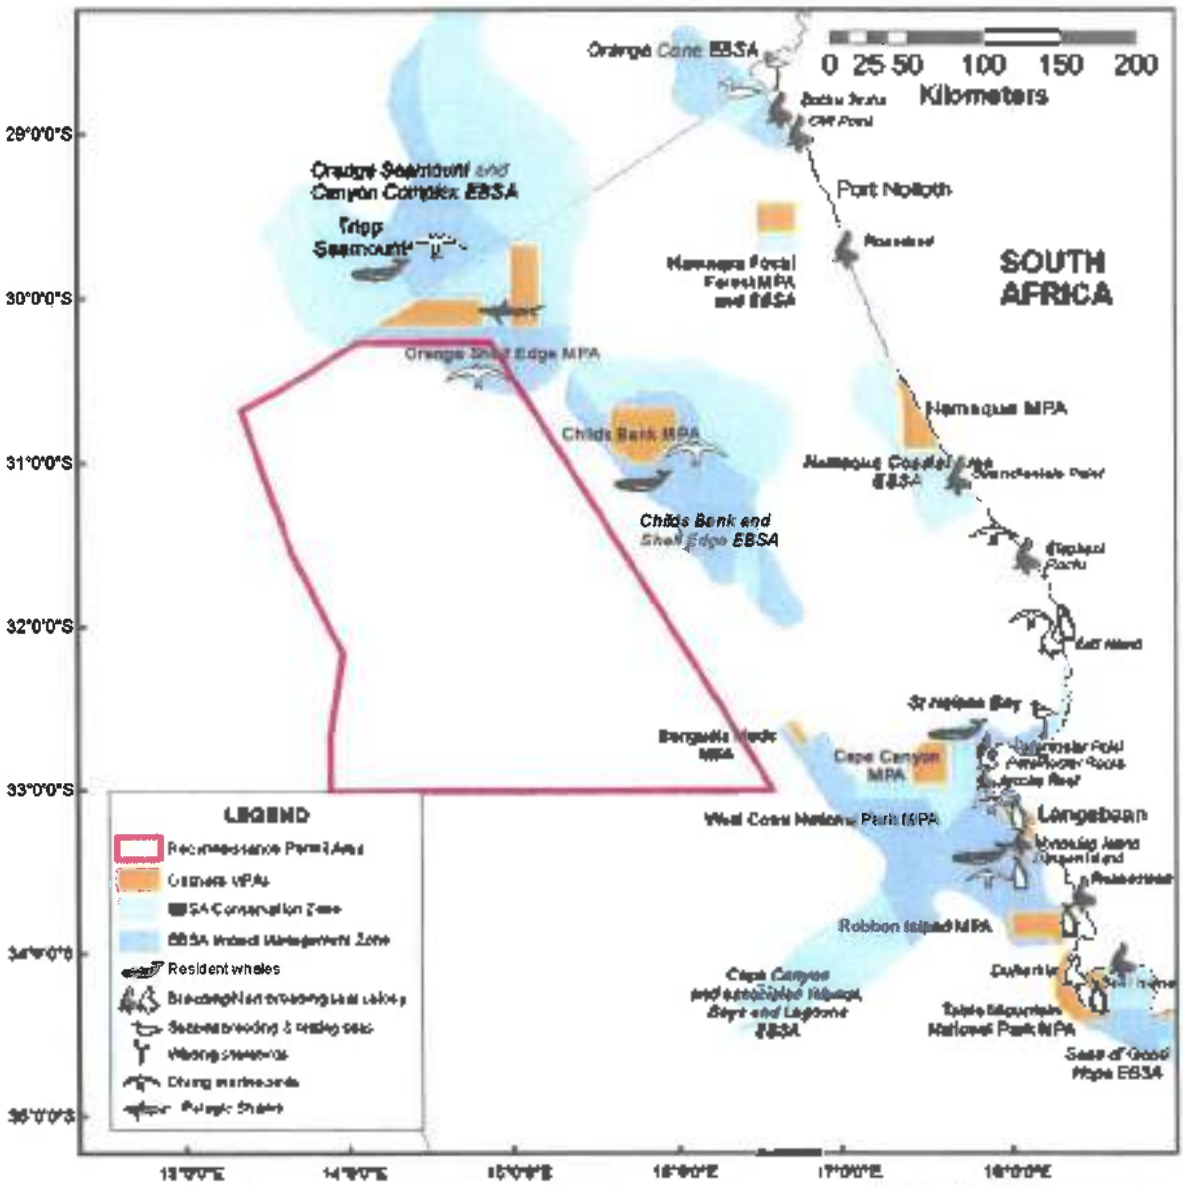

Figure 89: The Reconnaissance Permit Area (red polygon) in relation to project - environment interaction points on the West Coast, illustrating the location of seabird and seal colonies and resident whale populations. Marine Protected Areas (MPAs) and Ecologically and Biologically Significant Areas (EBSAs).

8.6.2.3 SENSITIVE AREAS

Despite the development of the offshore MPA network a number of 'Endangered' and 'Vulnerable' ecosystem types (i.e. Orange Cone Inner Shelf Mud Reef Mosaic, Orange Cone Muddy mid Shelf, Namaqua Muddy Sands, Southern Benguela Outer Shelf Mosaic, Southern Benguela Shelf Edge Mosaic and Southeast Atlantic Lower Slope) are currently 'not well protected' and further effort is needed to improve protection of these threatened ecosystem types (Sink *et al.* 2019) (Figure 90). Ideally, all highly threatened ('Critically Endangered' and 'Endangered') ecosystem types should be well protected. Currently, however, most of the Southern Benguela Sandy Shelf Edge and Southeast Atlantic Upper- and Mid-Slope are poorly protected receiving only 0.2-10% protection, whereas the Southeast Atlantic Lower Slope receives no protection at all (Sink *et al.* 2019). Expanding the size of the Orange Shelf Edge MPA to form a single MPA along the South African Border could improve protection of these threatened habitats. Most of the ecosystem types in the Application Area are either poorly protected or not protected.

8.6.2.4 ECOLOGICALLY OR BIOLOGICALLY SIGNIFICANT AREAS

As part of a regional Marine Spatial Management and Governance Programme (MARISMA 2014-2020) the Benguela Current Commission (BCC) and its member states have identified a number of Ecologically or Biologically Significant Areas (EBSAs) both spanning the border between Namibia and South Africa and along the South African West, South and East Coasts (see Figure 89), with the intention of implementing improved conservation and protection measures within these sites. South Africa currently has 11 EBSAs solely within its national jurisdiction with a further four having recently been proposed. It also shares five trans-boundary EBSAs with Namibia (3) and Mozambique (2). The principal objective of these EBSAs is identification of features of higher ecological value that may require enhanced conservation and management measures. They currently carry no legal status. The impact management and conservation zones within the EBSAs are under review and currently constitute a subset of the biodiversity priority areas map (see next section); EBSA conservation zones equate to Critical Biodiversity Areas (CBAs), whereas impact management zones equate to Ecological Support Area (ESAs). The relevant sea-use guidelines accompanying the CBA areas would apply.

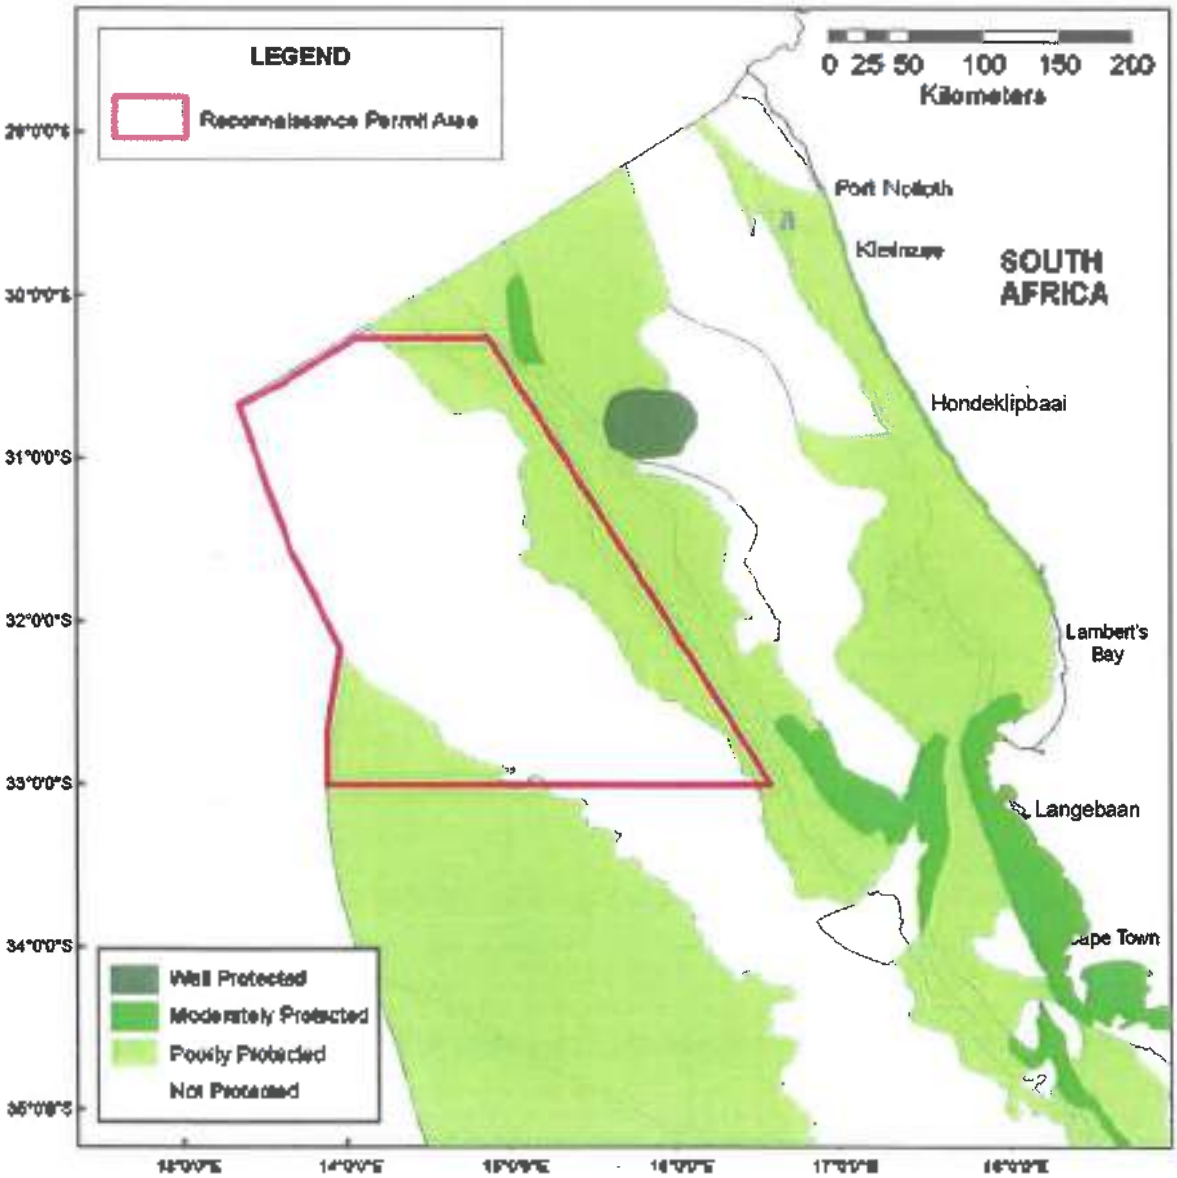

Figure 90: The Reconnaissance Permit Area (red polygon) in relation to protection levels of 150 marine ecosystem types as assessed by Sink *et al.* (2019).

The following summaries of the EBSAs in the Reconnaissance Permit area are adapted from http://cmr.mandela.ac.za/EBSA-Portal/Namibia/.

The Orange Seamount and Canyon Complex, occurs at the western continental margin of southern Africa, spanning the border between South Africa and Namibia. On the Namibian side, it includes Tripp Seamount and a shelf-indenting canyon. The EBSA comprises shelf and shelf-edge habitat with hard and unconsolidated substrates, including at least eleven offshore benthic habitat types of which four habitat types are 'Threatened', one is 'Critically endangered' and one 'Endangered'. The Orange Shelf Edge EBSA is one of few places where these threatened habitat types are in relatively natural/pristine condition. The local habitat heterogeneity is also thought to contribute to the Orange Shelf Edge being a persistent hotspot of species richness for demersal fish species. Although focussed primarily on the conservation of benthic biodiversity and threatened benthic habitats, the EBSA also considers the pelagic habitat, which is characterized by medium productivity, cold to moderate Atlantic temperatures (SST mean = 18.3°C) and moderate chlorophyll levels related to the eastern limit of the Benguela upwelling on the outer shelf. There is an slight overlap of the Reconnaissance Permit Area with this EBSA.

The Orange Cone transboundary EBSA lies well inshore of the Reconnaissance Permit Area and spans the mouth of the Orange River. The estuary is biodiversity-rich but modified, and the coastal area includes many 'Critically endangered', 'Endangered' and 'Vulnerable' habitat types (with the area being particularly important for the 'Critically Endangered' Namaqua Sandy Inshore, Namaqua Inshore Reef and Hard Grounds and Namaqua Intermediate and Reflective Sandy Beach habitat types). The marine environment experiences slow, but variable currents and weaker winds, making it potentially favourable for reproduction of pelagic species. An ecological dependence for of river outflow for fish recruitment on the inshore Orange Cone is also likely. The Orange River Mouth is a transboundary Ramsar site and falls within the Tsau//Khaeb (Sperrgebiet) National Park. It is also under consideration as a protected area by South Africa, and is an important Bird and Biodiversity Area.

The Namaqua Fossil Forest EBSA, which lies inshore of the Reconnaissance Permit Area, is a small seabed outcrop composed of fossilized yellowwood trees at 135-140 m depth, approximately 30 km offshore on the west coast of South Africa. A portion of the EBSA comprised the Namaqua Fossil Forest MPA. The fossilized tree trunks form outcrops of laterally extensive slabs of rock have been colonized by fragile, habitat-forming scleractinian corals and a newly described habitat-forming sponge species. The EBSA thus encompasses a unique feature with substantial structural complexity that is highly vulnerable to benthic impacts.

The Childs Bank and Shelf Edge EBSA, which lies ~ 17 km east of the Reconnaissance Permit Area at its closest point, is a unique submarine bank feature rising from 400 m to ~180 m on the western continental margin on South Africa. This area includes five benthic habitat types, including the bank itself, the outer shelf and the shelf edge, supporting hard and unconsolidated habitat types. Childs Bank and associated habitats are known to support structurally complex cold-water corals, hydrocorals, gorgonians and glass sponges; species that are particularly fragile, sensitive and vulnerable to disturbance, and recover slowly.

The Namaqua Coastal Area EBSA, which lies well inshore of the Reconnaissance Permit Area and encompasses the Namaqua Coastal Area MPA, is characterized by high productivity and community biomass along its shores. The area is important for several threatened ecosystem types represented there, including two 'Endangered' and four 'Vulnerable' ecosystem types, and is important for conservation of estuarine areas and coastal fish species.

The Cape Canyon and Associated Islands EBSA lies ~ 20 km inshore of the southern portion of the Reconnaissance Permit Area at its closest point. The EBSA includes the Benguela Muds MPA and the Cape Canyon, which is thought to hosts fragile habitat-forming species. The area is considered important for pelagic fish, foraging marine mammals and several threatened seabird species and serves to protect nine 'Endangered' and 12 'Vulnerable' ecosystem types, and two that are 'Near Threatened'. There are several small coastal MPAs within the EBSA.

The proposed Seas of Good Hope EBSA is located at the coastal tip of Africa, wrapping around Cape Point and Cape Agulhas. It extends from the coast to the inner shelf, and includes key islands (Seal Island, Dyer Island And Geyser Rocks), two major bays (False Bay and Walker Bay), and is of key importance for threatened species and habitats. The threatened habitats include coastal, inshore and inner shelf ecosystem types. The important life-history stages supported by the area are breeding and/or foraging grounds for a myriad of top predators, including sharks, whales, and seabirds, some of which are threatened species. This EBSA is also the place where the Benguela and Agulhas Currents meet.

The Benguela Upwelling System is a transboundary EBSA is globally unique as the only cold-water upwelling system to be bounded in the north and south by warm-water current systems, and is characterized by very high

primary production (>1 000 mg C.m^{-2}.day^{-1}). It includes important spawning and nursery areas for fish as well as foraging areas for threatened vertebrates, such as sea- and shorebirds, turtles, sharks, and marine mammals. Another key characteristic feature is the diatomaceous mud-belt in the Northern Benguela, which supports regionally unique low-oxygen benthic communities that depend on sulphide oxidising bacteria.

8.6.2.5 BIODIVERSITY PRIORITY AREAS

The National Coastal and Marine Spatial Biodiversity Plan[22] comprises a map of Critical Biodiversity Areas (CBAs), Ecological Support Area (ESAs) and accompanying sea-use guidelines. The CBA Map presents a spatial plan for the marine environment, designed to inform planning and decision-making in support of sustainable development. The sea-use guidelines enhance the use of the CBA Map in a range of planning and decision-making processes by indicating the compatibility of various activities with the different biodiversity priority areas so that the broad management objective of each can be maintained. The intention is that the CBA Map (CBAs and ESAs) and sea-use guidelines inform the MSP Conservation Zones and management regulations, respectively.

The Application Area overlaps with areas mapped as Critical Biodiversity Area 1 (CBA 1): Natural and Critical Biodiversity Area 2: (CBA 2) Natural. Approximately 32.25 % of the proposed 3D acquisition area is covered by CBA 1 and CBA 2 Natural, 0.22% by CBA 1 and CBA 2 Restore, and 1.75% by ESA (see Figure 91). CBA 1 indicates irreplaceable or near-irreplaceable sites that are required to meet biodiversity targets with limited, if any, option to meet targets elsewhere, whereas CBA 2 are "best design sites" and there often alternative areas where feature targets can be met; however, these will be of higher cost to other sectors and / or will be larger areas.

Regardless of how CBAs are split, CBAs are generally areas of low use and with low levels of human impact on the marine environment, but can also include some moderately to heavily used areas with higher levels of human impact. Given that some CBAs are not in natural or near-natural ecological condition, but still have very high biodiversity importance and are needed to meet biodiversity feature targets, CBA 1 and CBA 2 were split into two types based on their ecological condition. CBA Natural sites have natural / near-natural ecological condition, with the management objective of maintaining the sites in that natural / near natural state; and CBA Restore sites have moderately modified or poorer ecological condition, with the management objective to improve ecological condition and, in the long-term, restore these sites to a natural/near-natural state, or as close to that state as possible. ESAs include all portions of EBSAs that are not already within MPAs or CBAs, and a 5-km buffer area around all MPAs (where these areas are not already CBAs or ESAs), with the exception of the eastern edge of Robben Island MPA in Table Bay where a 1.5-km buffer area was applied (Harris *et al.* 2022).

Activities within these management zones are classified into those that are "compatible", those that are "not compatible", and those that have "restricted compatibility". Non-invasive (e.g. seismic surveys) and invasive (e.g. exploration wells) exploration activities are classified as having "restricted compatibility". Activities with restricted compatibility require a detailed assessment to determine whether the recommendation is that they should be permitted (general – as is the case for this assessment), permitted subject to additional regulations (consent), or prohibited, depending on a variety of factors. Petroleum production is, however, classified as "not compatible" in CBAs, but may be compatible, subject to certain conditions, in ESAs (Harris *et al.* 2022).

[22] The latest version of National Coastal and Marine Spatial Biodiversity Plan (v3.2 was released in April 2022) (Harris *et al.* 2022). The Plan is intended to be used by managers and decision-makers in those national government departments whose activities occur in the coastal and marine space, e.g., environment, fishing, transport (shipping), petroleum, mining, and others. It is relevant for the Marine Spatial Planning Working Group where many of these departments are participating in developing South Africa's emerging marine spatial plans. It is also intended for use by relevant managers and decision-makers in the coastal provinces and coastal municipalities, EIA practitioners, organisations working on the coast and ocean, civil society, and the private sector.

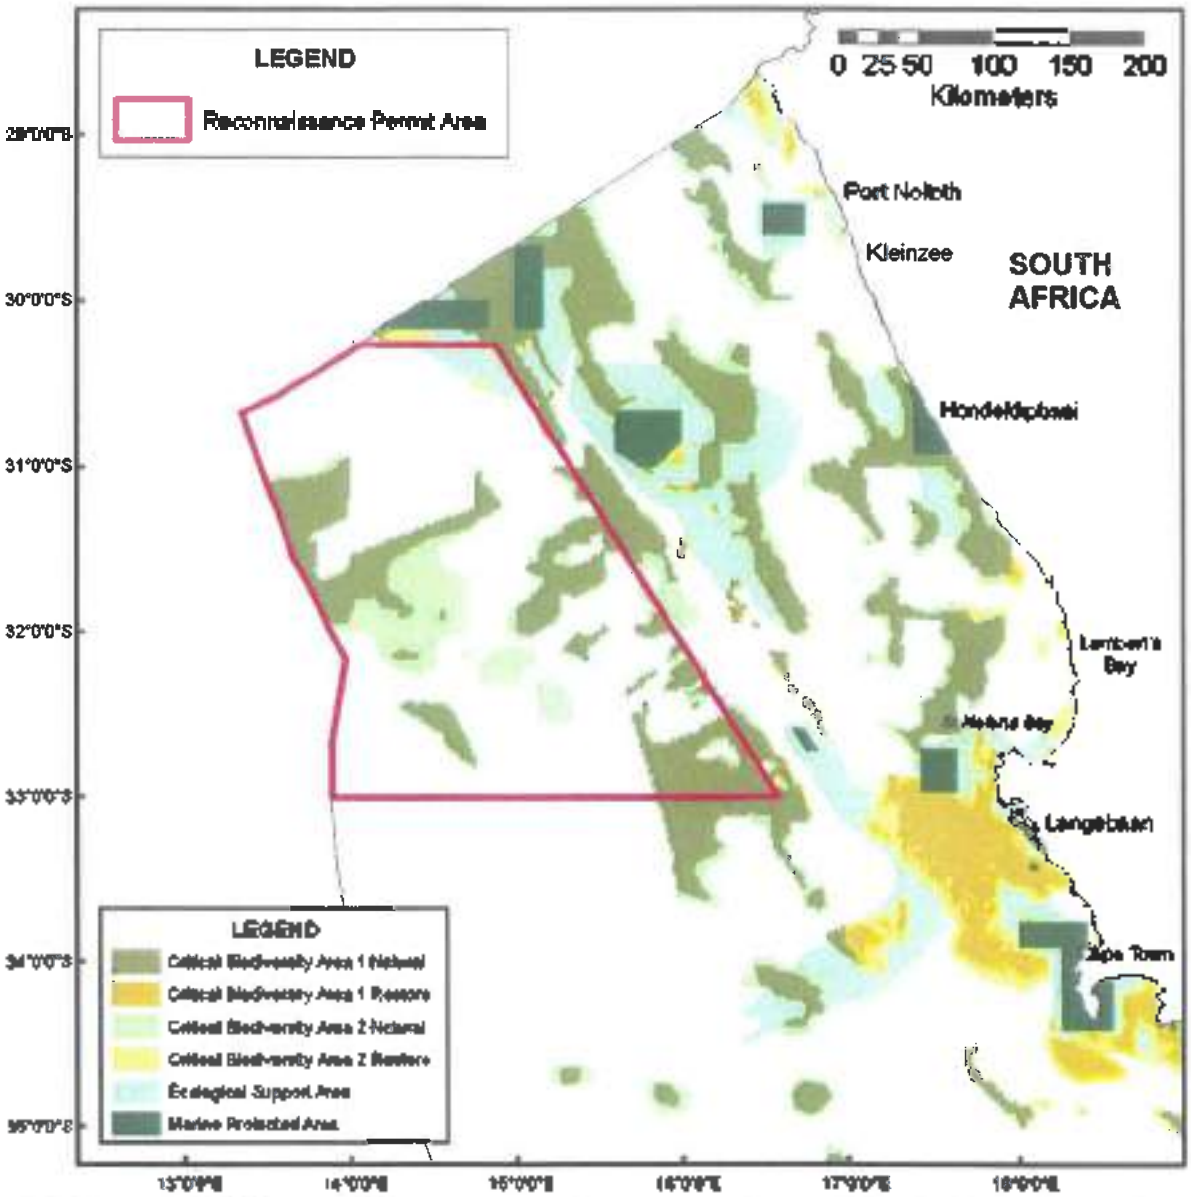

Figure 91: The Reconnaissance Permit Area (red polygon) in relation to Critical Biodiversity Areas (CBAs) and Ecological Support Areas (ESAs) (Version 1.2 April 2022).

8.6.2.6 IMPORTANT BIRD AREAS (IBAS)

There are numerous coastal Important Bird Areas (IBAs) in the general project area (Table 30) (www.http://datazone.birdlife.org/). These are all located well inshore of the Reconnaissance Permit area and should in no way be directly affected by the proposed seismic surveys.

Table 30: List of Important Bird Areas (IBAs) and their criteria listings. RAMSAR sites are bolded.

Site Name	IBA Criteria
Orange River Mouth Wetlands (ZA023)	**A1, A3, A4i, A4iii**
Olifants River Estuary (ZA078)	A3, A4i
Verlorenvlei Estuary (ZA082)	**A4i**
Berg River Estuary (ZA083)	**A4i**

Site Name	IBA Criteria
West Coast National Park and Saldanha Bay Islands (ZA 084) (incorporating Langebaan RAMSAR site)	A1, A4i, A4ii, A4iii
Dassen Island (ZA088)	A1, A4i, A4ii, A4iii
Robben Island (ZA089)	A1, A4i, A4ii, A4iii
Rietvlei Wetland: Table Bay Nature Reserve (ZA090)	A1, A4i
Boulders Beach (ZA096)	A1
False Bay Nature Reserve (ZA095)	A1, A4i, A4iii

A1. Globally threatened species; A2 Restricted-range species; A3 Biome-restricted species;

A4. Congregations: i. applies to "waterbird" species; ii. This includes those waterbird species not covered under i; iii. modelled on criterion 6 of the Ramsar Convention for identifying wetlands of international importance. The use of this criterion is discouraged where quantitative data are good enough to permit the application of A4i and A4ii.

The Orange River Mouth wetland located ~235 km to the northeast of the Reconnaissance Permit Area provides an important habitat for large numbers of a great diversity of wetland birds and is listed as a Global IBA (www.http://datazone.birdlife.org/). The area was designated a Ramsar site in June 1991, and processes are underway to declare a jointly-managed transboundary Ramsar reserve.

Various marine IBAs have also been proposed in South African and Namibian territorial waters, with a candidate trans-boundary marine IBA suggested off the Orange River mouth and a further candidate marine IBA suggested in international waters west of the Cape Peninsula (Figure 92). There is no overlap of the Reconnaissance Permit Area with any of these Marine IBAs.

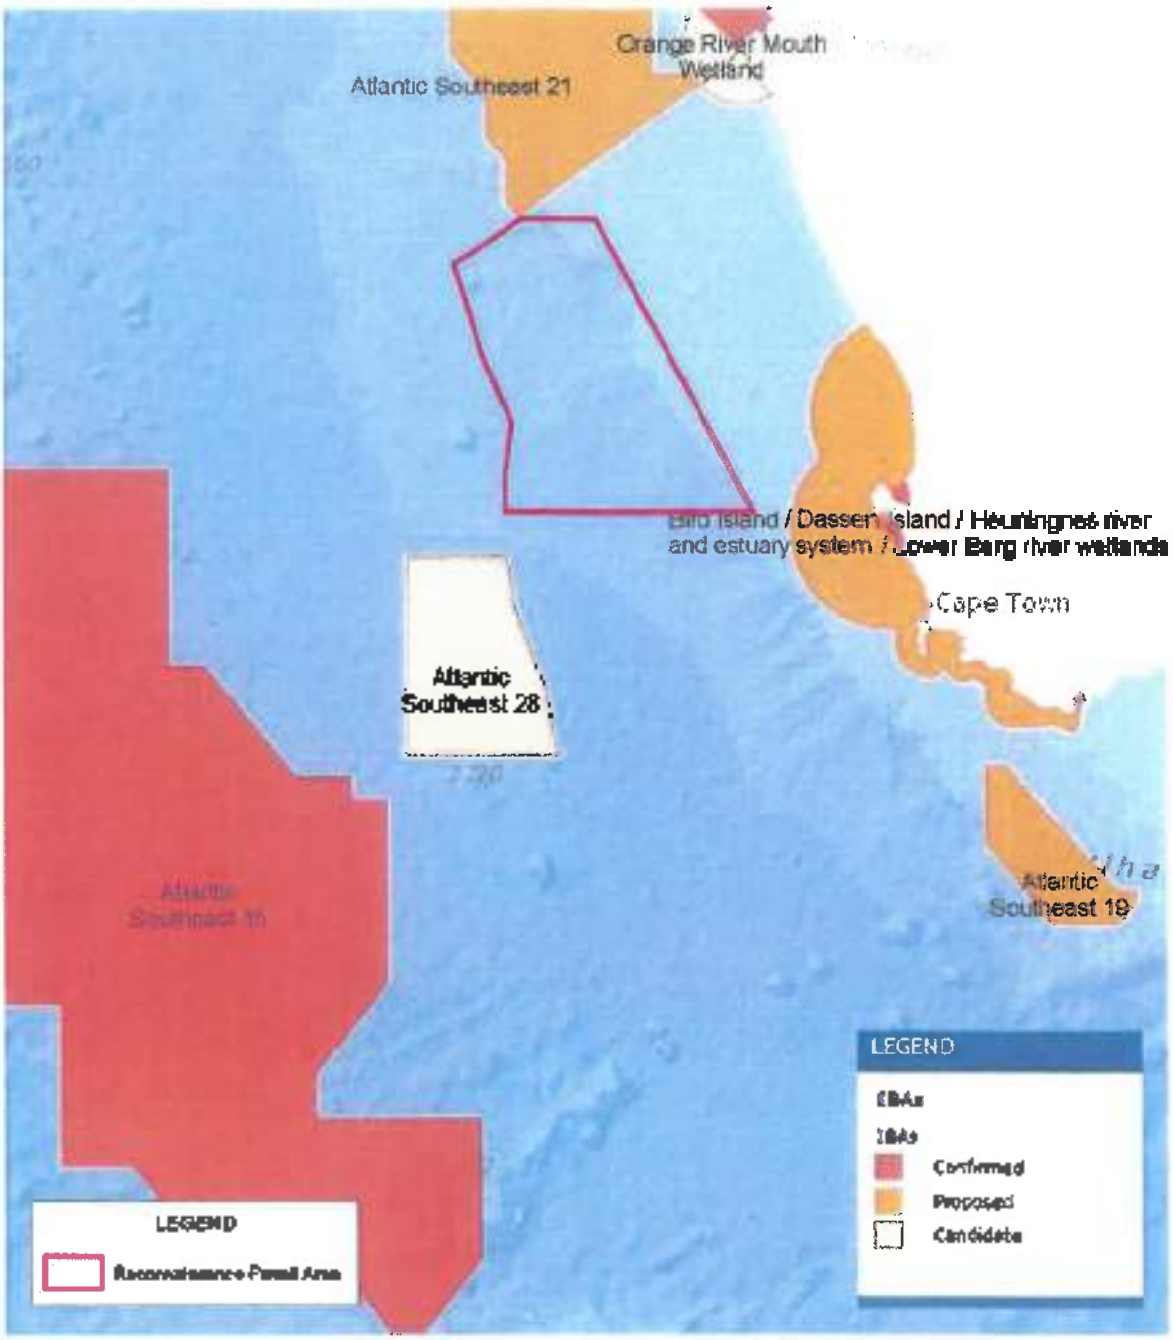

Figure 92: The Reconnaissance Permit Area (red polygon) in relation to coastal and marine IBAs in Namibia (Source: https://maps.birdlife.org/marineIBAs).

8.6.2.7 IMPORTANT MARINE MAMMAL AREAS (IMMAS)

Important Marine Mammal Areas (IMMAs) were introduced in 2016 by the IUCN Marine Mammal Protected Areas Task Force to support marine mammal and marine biodiversity conservation. Complementing other marine spatial assessment tools, including the EBSAs and Key Biodiversity Areas (KBAs), IMMAs are identified on the basis of four main scientific criteria, namely species or population vulnerability, distribution and abundance, key life cycle activities and special attributes. Designed to capture critical aspects of marine mammal biology, ecology and population structure, they are devised through a biocentric expert process that is independent of any political and socio-economic pressure or concern. IMMAs are not prescriptive but comprise an advisory, expert-based classification of areas that merit monitoring and place-based protection for marine mammals and broader biodiversity.

Modelled on the BirdLife International process for determining IBAs, IMMAs are assessed against a number of criteria and sub-criteria, which are designed to capture critical aspects of marine mammal biology, ecology and population structure. These criteria are:

- **Criterion A – Species or Population Vulnerability**
    - Areas containing habitat important for the survival and recovery of threatened and declining species.
- **Criterion B – Distribution and Abundance**
    - Sub-criterion B1 – Small and Resident Populations: Areas supporting at least one resident population, containing an important proportion of that species or population that are occupied consistently.
    - Sub-criterion B2 – Aggregations: Areas with underlying qualities that support important concentrations of a species or population.
- **Criterion C – Key Life Cycle Activities**
    - Sub-criterion C1 – Reproductive Areas: Areas that are important for a species or population to mate, give birth, and/or care for young until weaning.
    - Sub-criterion C2 – Feeding Areas: Areas and conditions that provide an important nutritional base on which a species or population depends.
    - Sub-criterion C3 – Migration Routes: Areas used for important migration or other movements, often connecting distinct life-cycle areas or the different parts of the year-round range of a non-migratory population.
- **Criterion D – Special Attributes**
    - Sub-criterion D1 – Distinctiveness: Areas which sustain populations with important genetic, behavioural or ecologically distinctive characteristics.
    - Sub-criterion D2 – Diversity: Areas containing habitat that supports an important diversity of marine mammal species

Although much of the West Coast of South Africa has not yet been assessed with respect to its relevance as an IMMA, the coastline from the Olifants River mouth on the West Coast to the Mozambiquan border overlaps with three declared IMMAs (Figure 93) namely the following:

- Southern Coastal and Shelf Waters of South Africa IMMA (156 700 km^2),
- Cape Coastal Waters IMMA (6 359 km^2), and
- South East African Coastal Migration Corridor IMMA (47 060 km^2).

These are described briefly below based on information provided in IUCN-Marine Mammal Protected Areas Task Force (2021) (www.marinemammalhabitat.org).

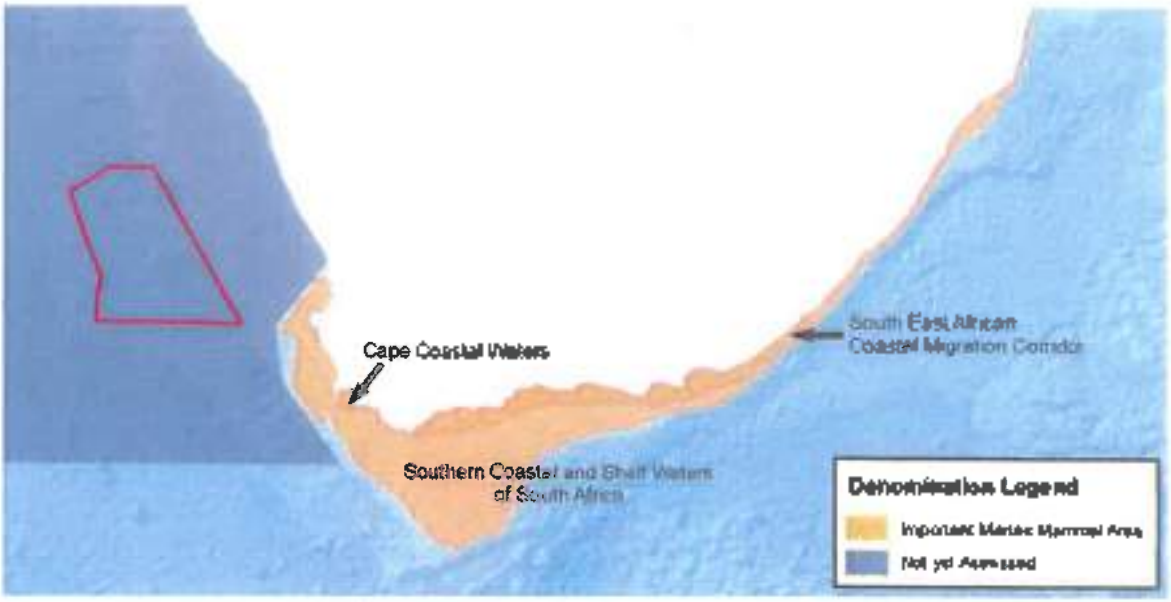

Figure 93: Reconnaissance Permit Area (red polygon) in relation to coastal and marine IMMAs (Source: www.marinemammalhabitat. org/imma-eatlas/).

The 166 700 km² Southern Coastal and Shelf Waters of South Africa IMMA extends from the Olifants River mouth to the mouth of the Cintsa River on the Wild Coast. Qualifying species are the Indian Ocean Humpback dolphin (Criterion A, B1), Bryde's whale (Criterion C2), Indo-Pacific bottlenose dolphin (Criterion B1, C3, D1), Common dolphin (Criterion C2) and Cape fur seal (criterion C2). The IMMA covers the area supporting the important 'sardine run' and the marine predators that follow and feed on the migrating schools (Criterion C2) as well as containing habitat that supports an important diversity of marine mammal species (Criterion D2) including the Indian Ocean humpback dolphin, the inshore form of Bryde's whale, Indo-Pacific bottlenose dolphin, common dolphin, Cape fur seal, humpback whales, killer whales and southern right whales.

The Cape Coastal Waters IMMA extends from Cape Point to Woody Cape at Algoa Bay and extends over some 6 359 km². It serves as one of the world's three most important calving and nursery grounds for southern right whales, which occur in the extreme nearshore waters (within 3 km of the coast) from Cape Agulhas to St. Sebastian Bay between June and November (Criterion B2, C1). Highest densities of cow-calf pairs occur between Cape Agulhas and the Duiwenhoks River mouth (Struisbaai, De Hoop, St Sebastian Bay), while unaccompanied adult densities peak in Walker Bay and False Bay. The IMMA also contains habitat that supports an important diversity of marine mammal species including the Indian Ocean humpback dolphin and Indo-Pacific bottlenose dolphin.

The South East African Coastal Migration Corridor IMMA extends some 47 060 km² from Cape Agulhas to the Mozambiquan border and serves as the primary migration route for C1 substock of Southern Hemisphere humpback whales (Criterion C3). On their northward migration between June and August, they are driven closer to shore due to the orientation of the coast with the Agulhas Current, whereas during the southward migration from September to November, they remain further offshore (but generally within 15 km of the coast) utilising the southward flowing Agulhas Current as far west as Knysna. The IMMA also contains habitat that supports an important diversity of marine mammal species including the Indian Ocean humpback dolphin, Common dolphin, Indo-Pacific bottlenose dolphin, Spinner dolphin, Southern Right whale, and killer whale.

There is no overlap of the Reconnaissance Permit Area with these IMMAs as it falls within the area along the West Coast of South Africa that has not yet been assessed.

8.7 SOCIO-ECONOMIC

This section provides and overview of the socio-economic environment for the study area. The majority of this information has been sourced from the Social Impact Assessment undertaken by Equispectives (Pty) Ltd, included in Appendix 3.

8.7.1 POPULATION

The baseline description of the population will take place on three levels, namely provincial, district and local. Impacts can only truly be comprehended by understanding the differences and similarities between the different levels. The baseline description will focus on the municipal areas along the west coast that are most likely to be affected by the proposed project.

8.7.1.1 POPULATION AND HOUSEHOLD SIZES

According to the Community Survey 2016, the population of South Africa is approximately 55,7 million and has shown an increase of about 7.5% since 2011. The household density for the country is estimated on approximately 3.29 people per household, indicating an average household size of 3-4 people (leaning towards 3) for most households, which is down from the 2011 average household size of 3.58 people per household. Smaller household sizes are in general associated with higher levels of urbanisation.

The greatest increase in population since 2011 has been in the Swartland and Saldanha Bay Local Municipalities (Table 31) and the increases were well above the national average. The Richtersveld Local Municipality where Port Nolloth is located is the only one of the coastal municipalities in the Northern Cape that showed an increase in population. The Kamiesberg Local Municipality where Hondeklip Bay is located, saw the greatest decrease in population between 2011 and 2016. Population density refers to the number of people per square kilometre and the population density on a national level has increased from 42.45 people per km^2 in 2011 to 45.63 people per km^2 in 2016. The City of Cape Town had the highest population density in 2016, and the Kamiesberg Local Municipality the lowest. Figure 94 gives a comparison of the population density. The municipalities in the rural areas in the Northern Cape are the least densely populated, while the metropolitan areas in Cape Town have the highest population density.

Figure 95 shows the number of people per ward. The wards in the rural areas tend to have less people spread over a greater area, while in the urban areas there are more people in a much smaller area.

Table 31: Population density and growth estimates (sources: Census 2011, Community Survey 2016)

Area	Size in km^2	Population 2011	Population 2016	Population density 2011	Population density 2016	Growth in population (%)

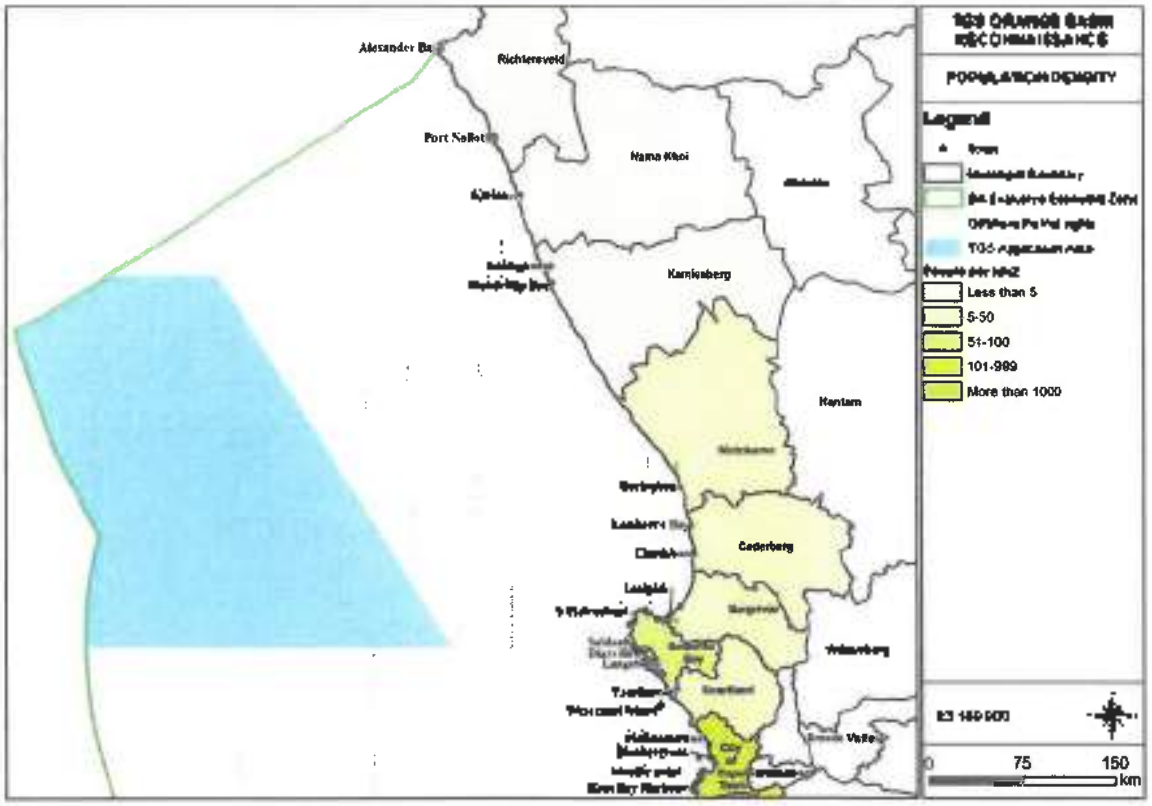

Figure 94: Population density (source: Community Survey 2016)

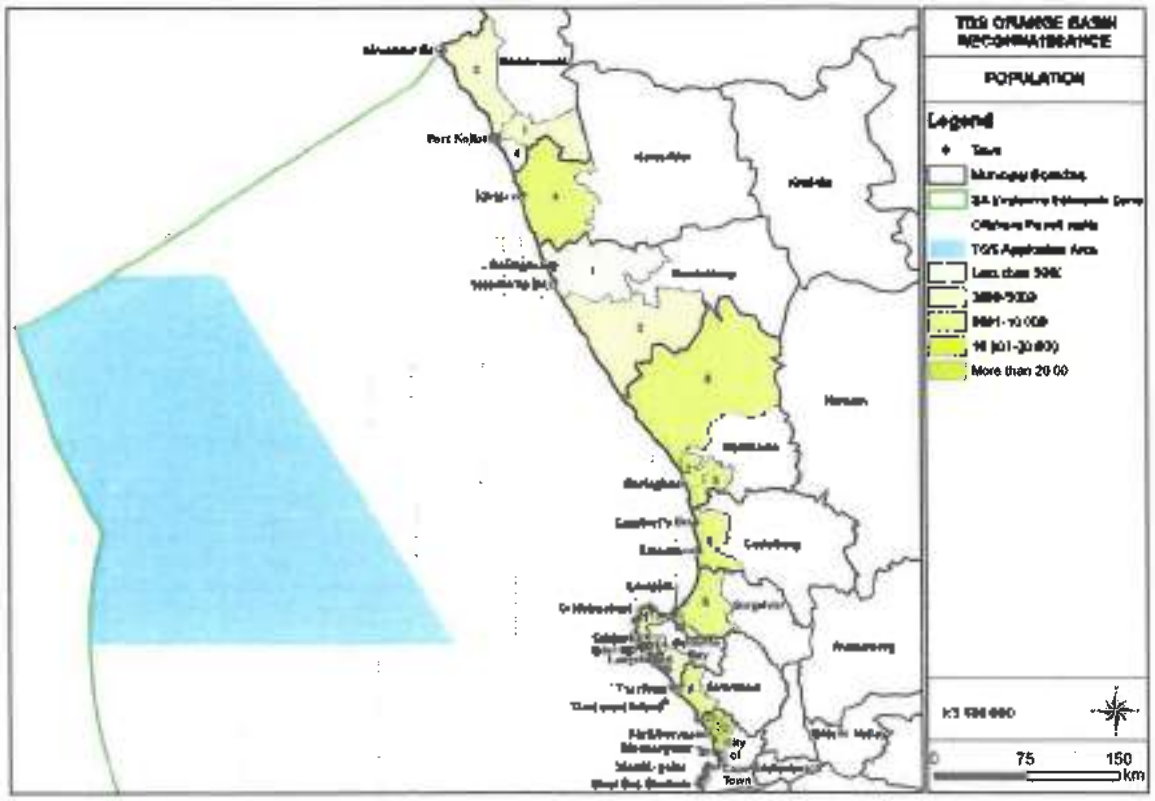

Figure 95: People per ward (source: Census 2011)

FW28

The number of households in the study area has increased on all levels (Table 32). The proportionate increase in households were greater than the increase in population on all levels. The greatest proportional increases in households were in the Swartland and Saldanha Bay Local Municipalities. The average household size has shown a decrease on all levels, which means there are more households, but with less members.

Table 32: Household sizes and growth estimates (sources: Census 2011, Community Survey 2016)

Area	Households 2011	Households 2016	Average household size 2011	Average household size 2016	Growth in households (%)

City of Cape Town Metropolitan	1,066,573	1,264,849	3.50	3.27	18.57

Figure 96 shows the number of households per ward. The wards in the Kamiesberg Local Municipality have the fewest people per ward.

The total dependency ratio is used to measure the pressure on the productive population and refer to the proportion of dependents per 100 working-age population. As the ratio increases, there may be an increased burden on the productive part of the population to maintain the upbringing and pensions of the economically dependent. A high dependency ratio can cause serious problems for a country as the largest proportion of a government's expenditure is on health, social grants and education that are most used by the old and young population.

The Kamiesberg Local Municipality has the highest total dependency ratio (Table 33), while in the Richtersveld Local Municipality have the lowest. Employed dependency ratio refers to the proportion of people dependent on the people who are employed, and not only those of working age. The employed dependency ratio for the Kamiesberg and Nama Khoi Local Municipalities are the highest. This suggests high levels of poverty in these areas. Figure 97 and Figure 98 show the total and employed dependency ratios on a ward level.

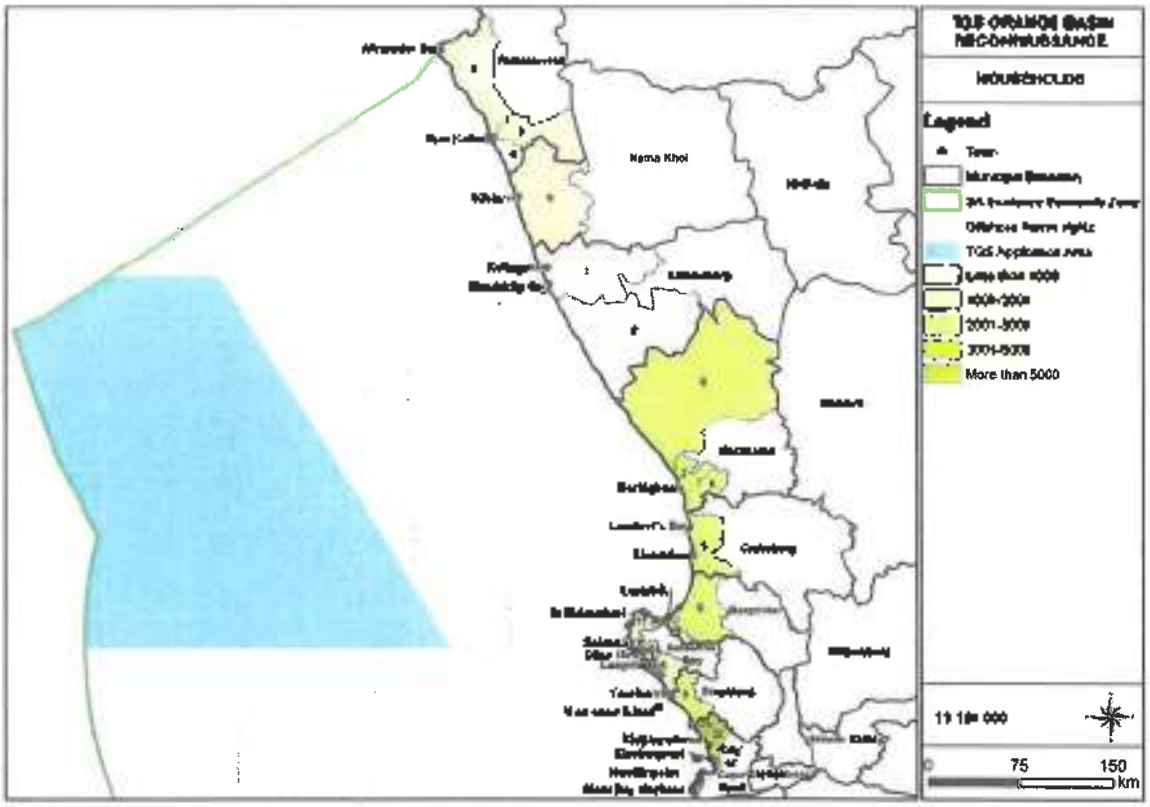

Figure 96: Households per ward (source: Census 2011)

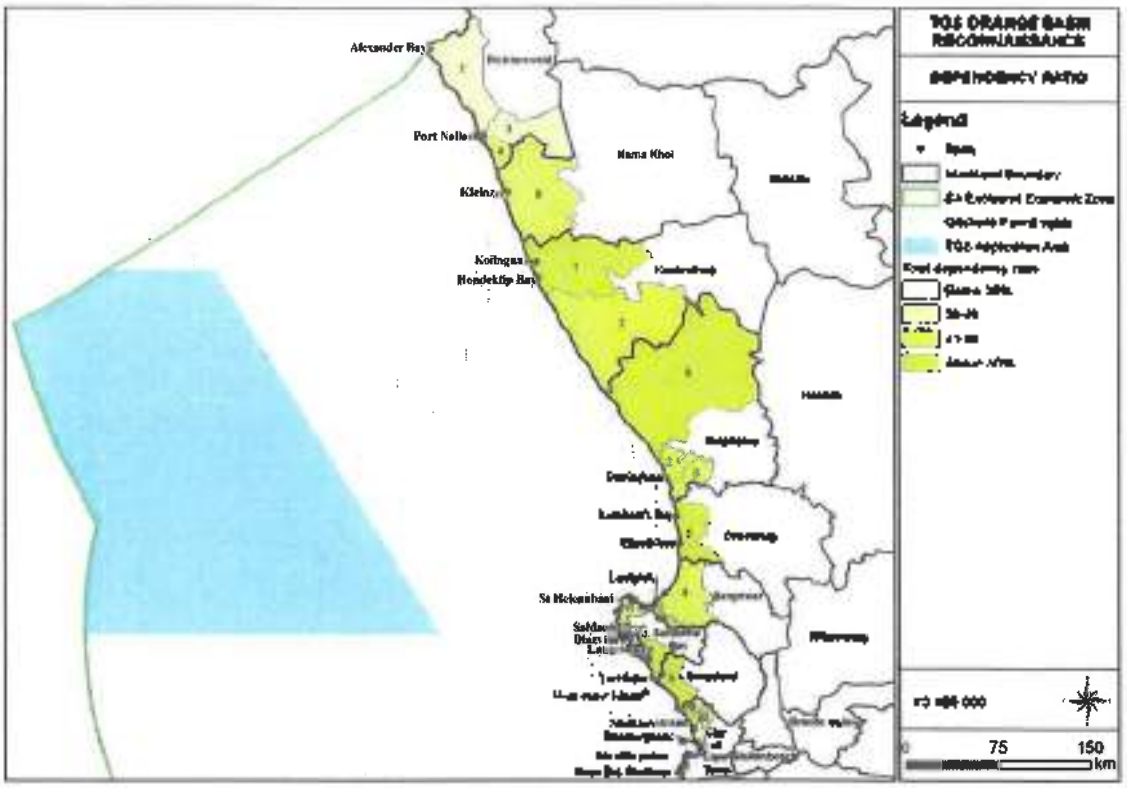

Figure 97: Total dependency ratios (source: Census 2011)

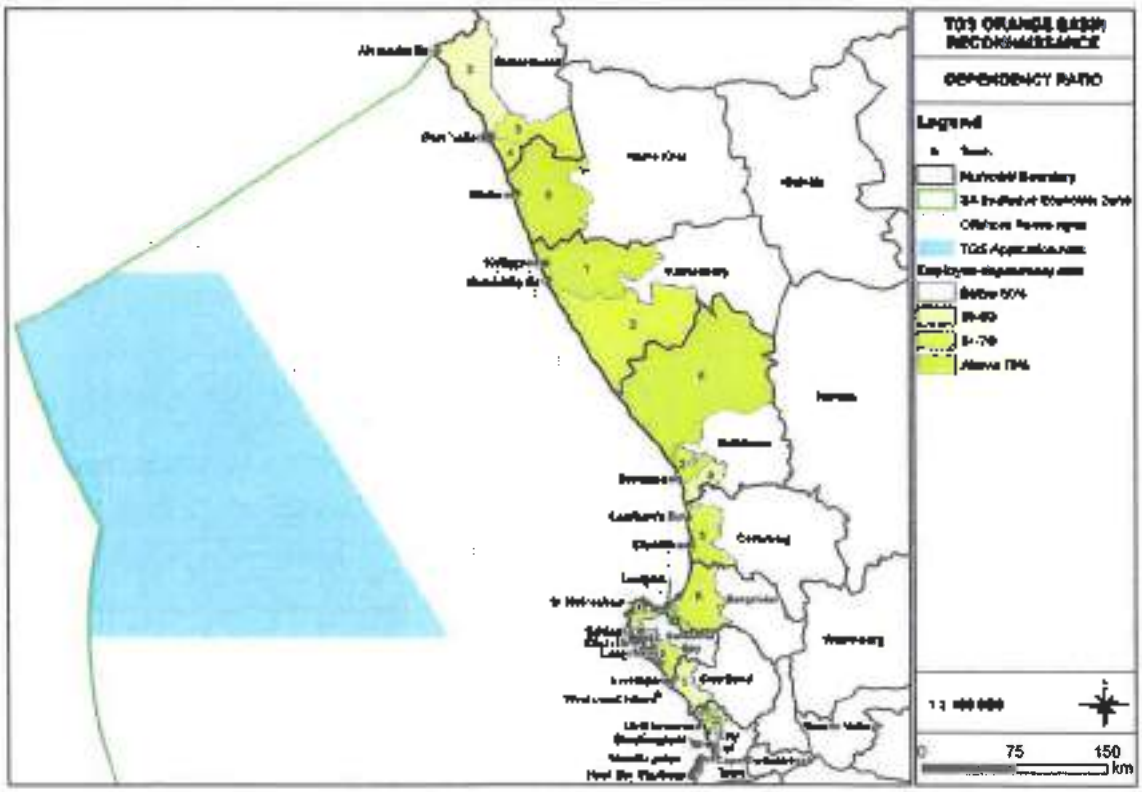

Figure 98: Employed dependency ratio (source: Census 2011).

Poverty is a complex issue that manifests itself in economic, social, and political ways and to define poverty by a unidimensional measure such as income or expenditure would be an oversimplification of the matter. Poor people themselves describe their experience of poverty as multidimensional. The South African Multidimensional Poverty Index (SAMPI) (Statistics South Africa, 2014) assess poverty on the dimensions of health, education, standard of living and economic activity using the indicators child mortality, years of schooling, school attendance, fuel for heating, lighting, and cooking, water access, sanitation, dwelling type, asset ownership and unemployment.

The poverty headcount refers to the proportion of households that can be defined as multi-dimensionally poor by using the SAMPI's poverty cut-offs (Statistics South Africa, 2014). The poverty headcount has increased on all levels since 2011 (Table 34), indicating an increase in the number of multi-dimensionally poor households.

The intensity of poverty experienced refers to the average proportion of indicators in which poor households are deprived (Statistics South Africa, 2014). The intensity of poverty has increased slightly on all levels. The intensity of poverty and the poverty headcount is used to calculate the SAMPI score. A higher score indicates a very poor community that is deprived on many indicators. The SAMPI score has decreased in the Northern Cape (Table 34) as well as the Northern Cape municipalities included in the study. In the Nama Khoi Local Municipality, the score remained the same although there was a slight increase in the intensity of the poverty. In the Western Cape the SAMPI score decreased on a provincial level, but in the West Coast District Municipality it has increased.

Table 34: Poverty and SAMPI scores (sources: Census 2011 and Community Survey 2016).

Area	Poverty headcount 2011 (%)	Poverty intensity 2011 (%)	SAMPI 2011	Poverty headcount 2016 (%)	Poverty intensity 2016 (%)	SAMPI 2016
Northern Cape	7.1	42.1	0.030	6.6	42	0.028

City of Cape Town Metropolitan	3.9	42.8	0.017	3.6	39.3	0.010

8.7.1.2 POPULATION COMPOSITION, AGE, GENDER AND HOME LANGUAGE

The majority of the people living in wards adjacent to the ocean are classified as belonging to the Coloured population group (Figure 99). The Coloured population group include Khoe and San people who in general find this classification offensive and they do not identify as such.

The Kamiesberg Local Municipality has the highest average age (33.17 years) while the Saldanha Bay Local Municipality has the lowest (29.86 years). Average age varies on a ward level. The gender distribution is more or less equal in most municipal areas, except for the Richtersveld Local Municipality where there is a bias towards males. This is most likely due to mining activities that are taking place in the area. On a ward level, most people have Afrikaans as home language (Figure 100).

JCB

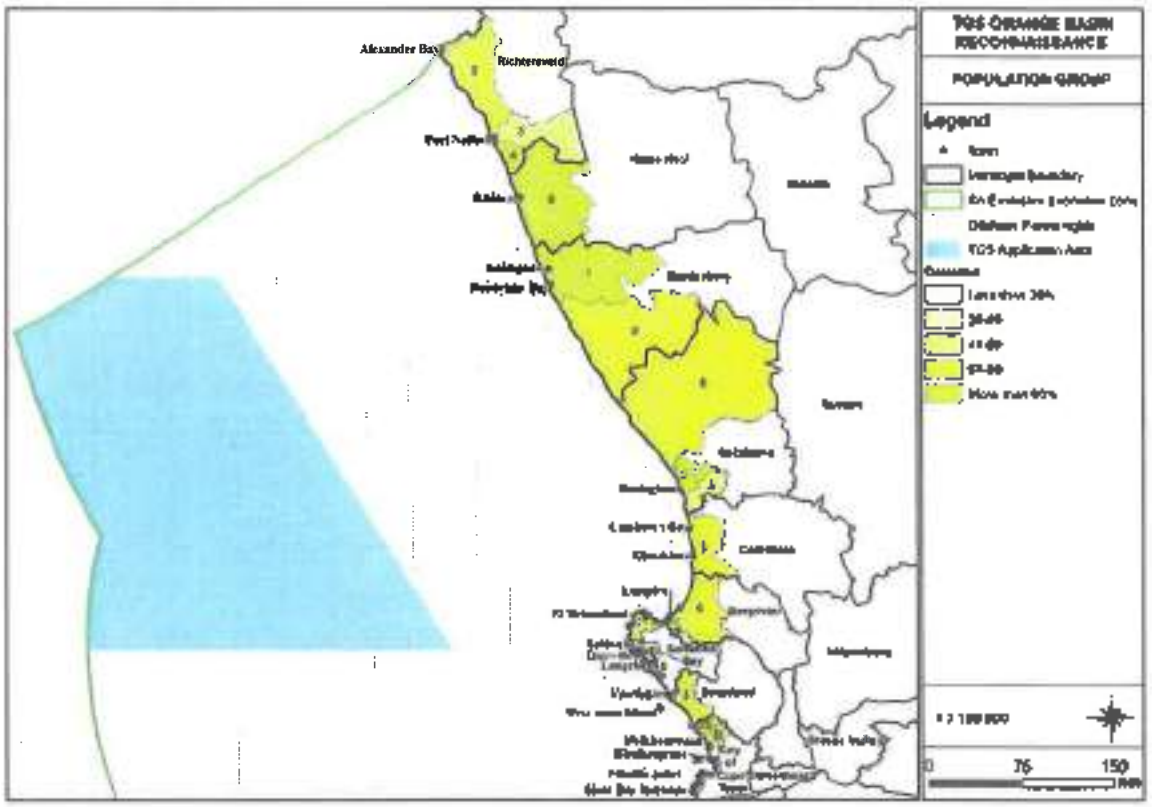

Figure 98: Classified as Coloured (shown in percentage, source: Census 2011)

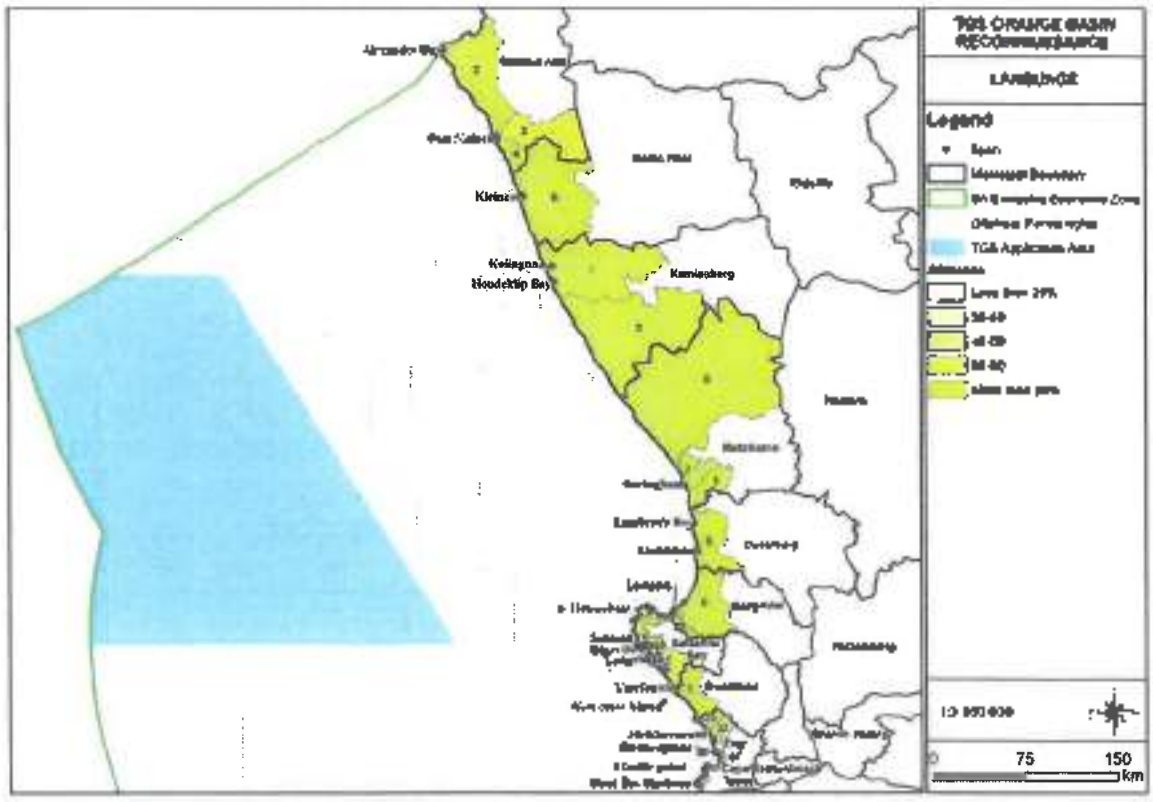

Figure 100: Home language Afrikaans (shown in percentage, source; Census 2011)

5698

8.7.1.3 EDUCATION

The highest proportion of people who did not complete high school is in the Saldanha Bay (73.59%) and the Swartland (72.83%) Local Municipalities while the Matzikama (32.7%) and Nama Khoi (37.37%) Local Municipalities have the lowest proportion of people that did not complete high school (Figure 101).

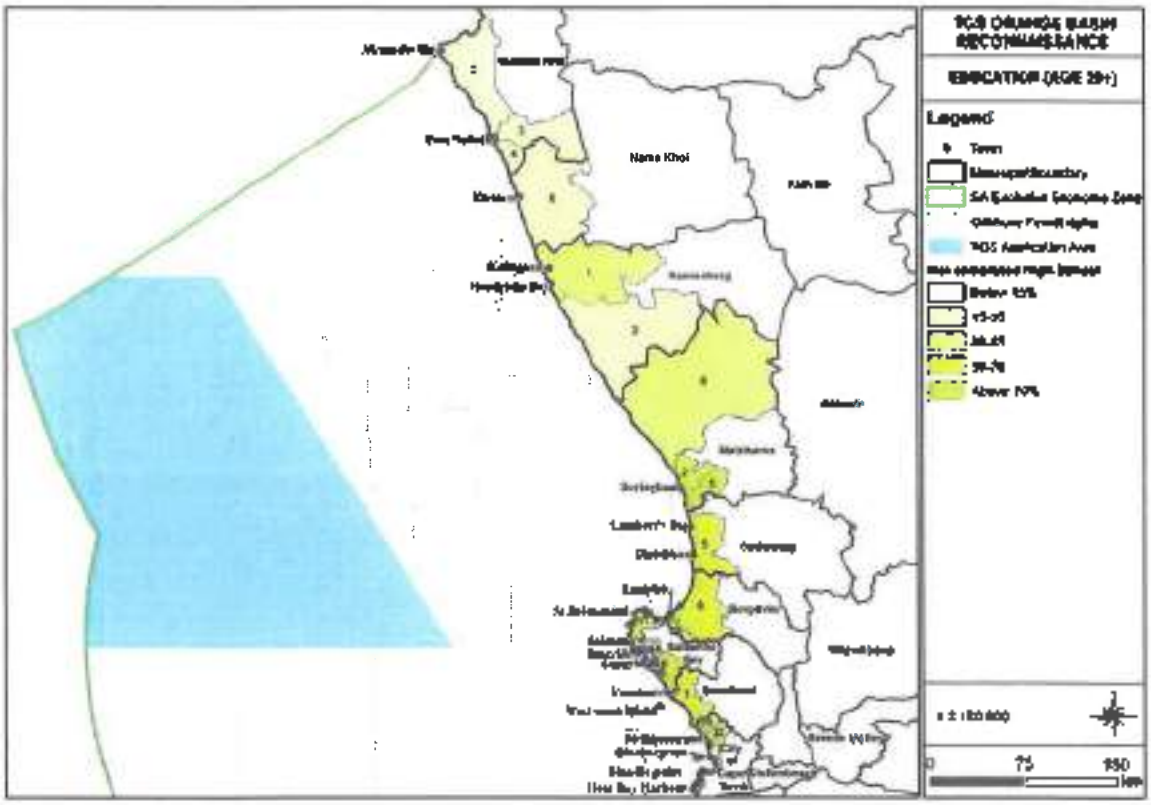

Figure 101: Proportion of people that did not complete secondary school (shown in percentage, source: Census 2011).

8.7.1.4 EMPLOYMENT

In 2011 the area with the highest proportion of unemployed people was Ward 1 in the Kamiesberg Local Municipality where Hondeklip Bay is located (Figure 102). The proportion of unemployed people include those actively seeking for work as well as discouraged work seekers. The majority of people who are working, is employed in the formal sector.

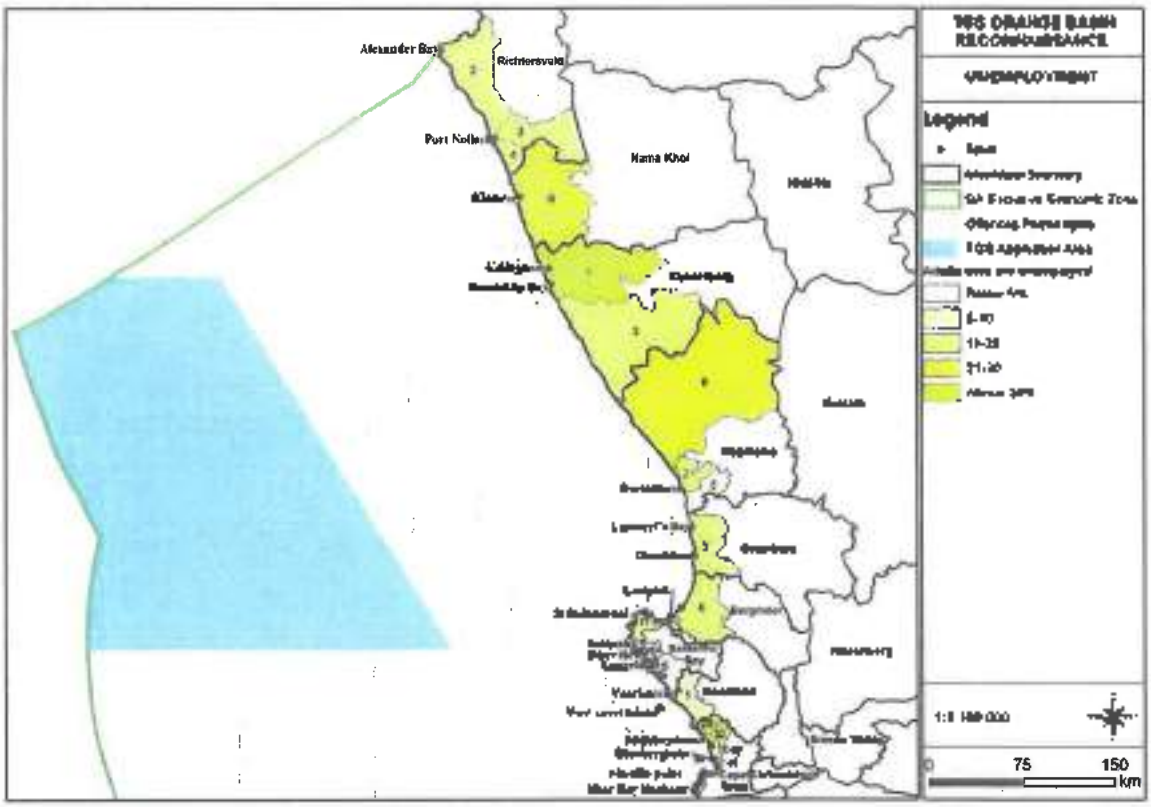

Figure 102: Proportion of adults that are unemployed (shown in percentage, source: Census 2011).

8.7.1.5 HOUSEHOLD INCOME

In 2011 almost a third of households on municipal level had an annual household income of R19 600 or less, with great variation between wards (Figure 103). Statistics South Africa (2015) has calculated the Food Poverty Line (FPL) for the Northern Cape Province as R310 per capita per month for 2011 where the FPL is the Rand value below which individuals are unable to purchase or consume enough food to supply them with the minimum per-capita-per-day energy requirement for good health. The FPL is one of three poverty lines, the others being the upper bound poverty line (UBPL) and the lower bound poverty line (LBPL). The LBPL and UBPL both include a non-food component. Individuals at the LBPL do not have enough resources to consumer or purchase both adequate food and non-food items and are forced to sacrifice food to obtain essential non-food items, while individuals at the UBPL can purchase both adequate food and non-food items. The LBPL for the Northern Cape Province was R457 per capita per month in 2011 and the UBPL R705 per capita per month respectively. The FPL for Western Cape was R352 per capita per month, the LBPL was R545 and the UPL was R804. Based on this, a household with four members needed an annual household income of approximately R17 000 in 2011 to be just above the FPL. When comparing this with the SAMPI data it seems as if there are more households below the poverty lines in the area than who are multi-dimensionally poor. This is due to the poverty lines using a financial measure and do not take into consideration payment in kind and livelihood strategies such as subsistence farming. If these were to be converted into a Rand value, the poverty line picture may have a closer resemblance to the SAMPI data.

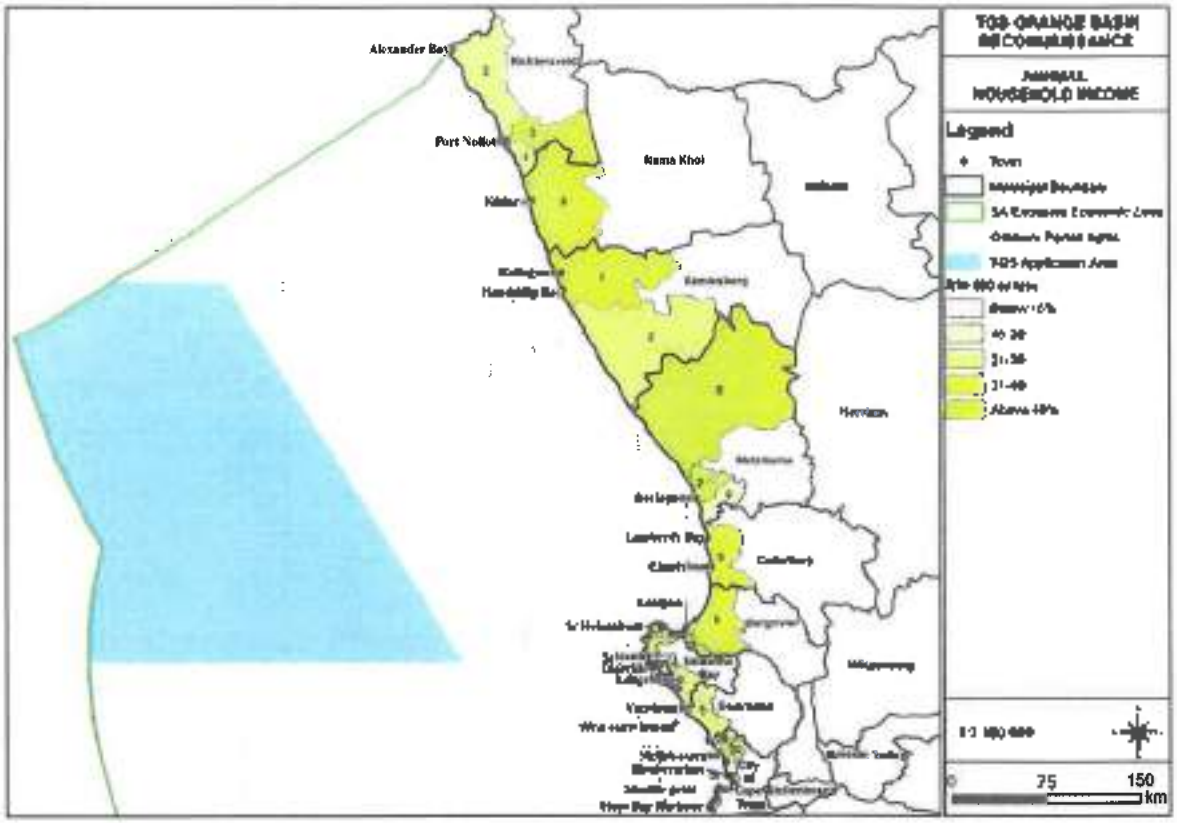

Figure 103: Proportion of households with an annual income of R19 600 or less in 2011 (shown in percentage, source: Census 2011).

8.7.1.6 HOUSING

The majority of households live in areas that are classified as urban, except in the Matzikama Local Municipality (Figure 104). The majority of people live in formal dwellings that that are houses or structures that are on a separate stand or yard. The incidence of informal dwellings is relatively low (Figure 105), except for Ward 1 of the Saldanha Bay Local Municipality where the majority of people live in informal dwellings. Wards 32 and 74 also have a relatively large proportion of households living in informal dwellings.

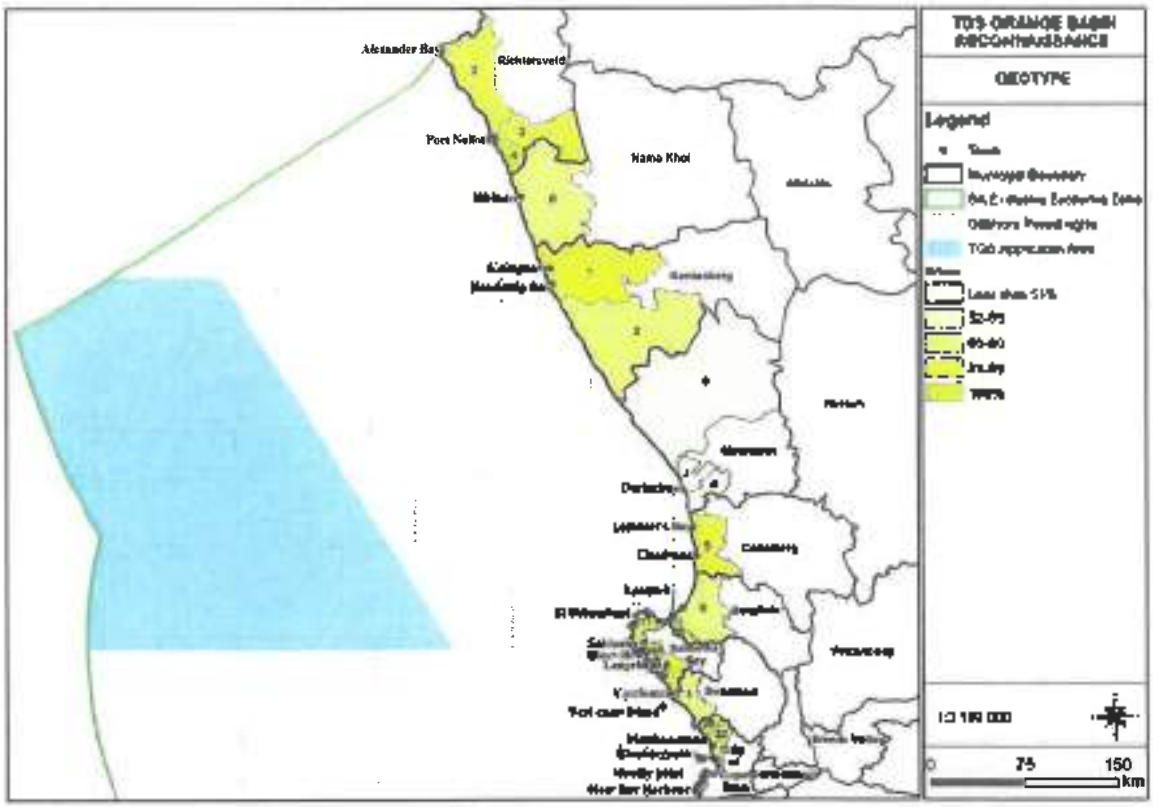

Figure 104: Proportion of households that live in urban areas (shown in percentage, source: Census 2011).

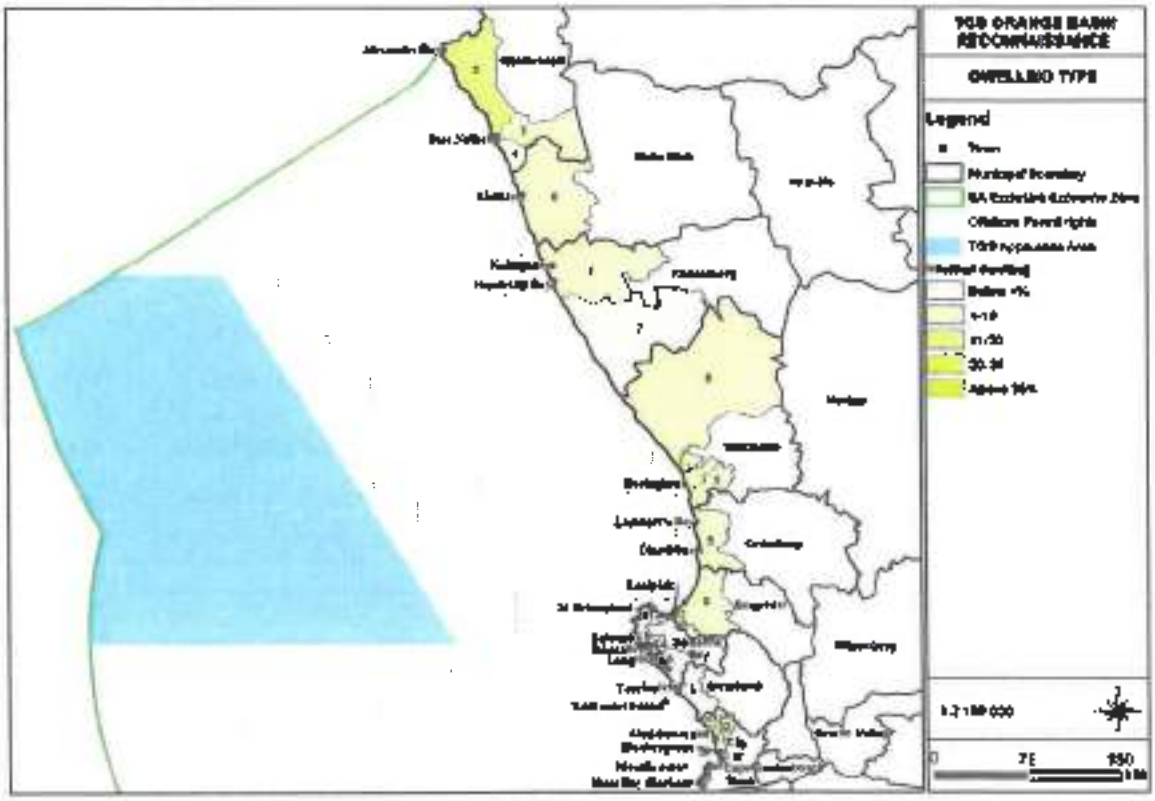

Figure 105: Proportion of households that live in informal dwellings (shown in percentage, source: Census 2011).

3.7.1.7 ACCESS TO WATER AND SANITATION

Access to piped water, electricity and sanitation relate to the domain of Living Environment Deprivation as identified by Noble *et al* (2006). Most households get their water from a regional or local water scheme, with the lowest incidence in Ward 1 of the Kamieskroon Local Municipality where Hondeklip Bay is located (Figure 106).

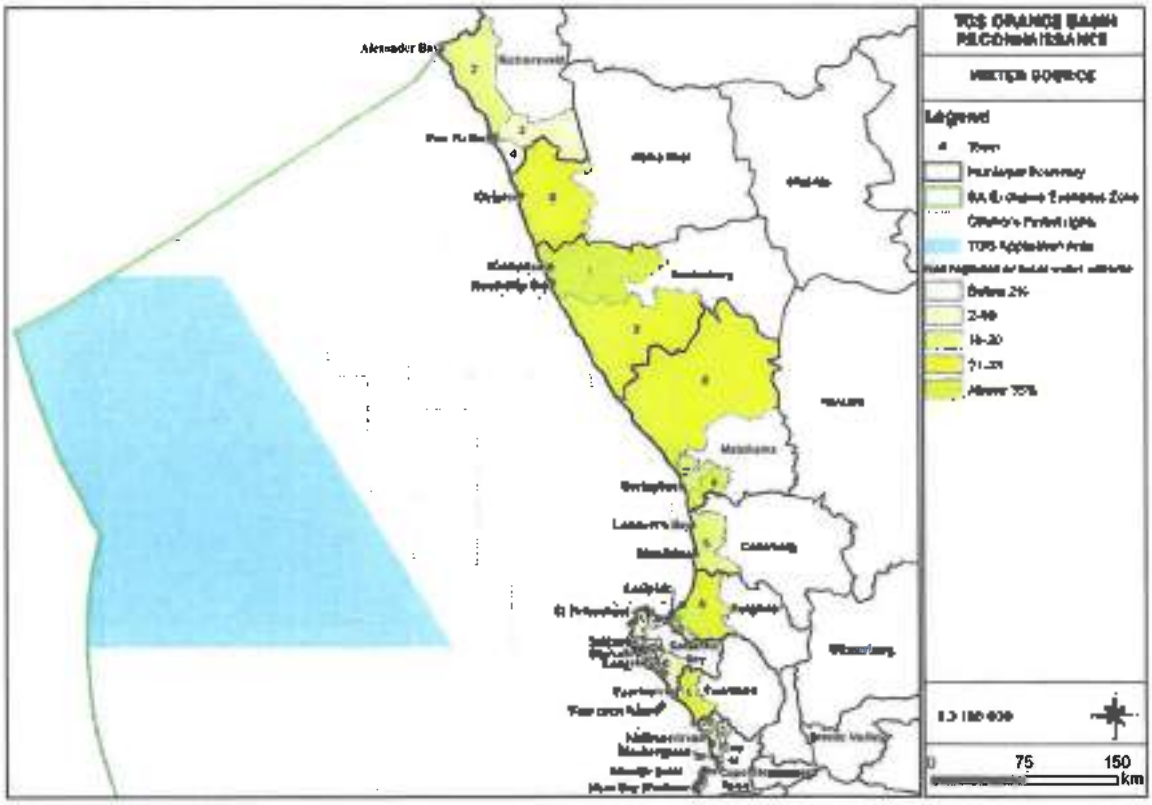

Figure 106: Proportion of households that does not get water from a regional or local water scheme (shown in percentage, source: Census 2011).

The incidence of access to piped water inside the dwelling varies and tend to be lower in the Northern Cape municipalities (Figure 107). Access to a flushing toilet is in general lower in the Northern Cape Municipalities (Figure 108).

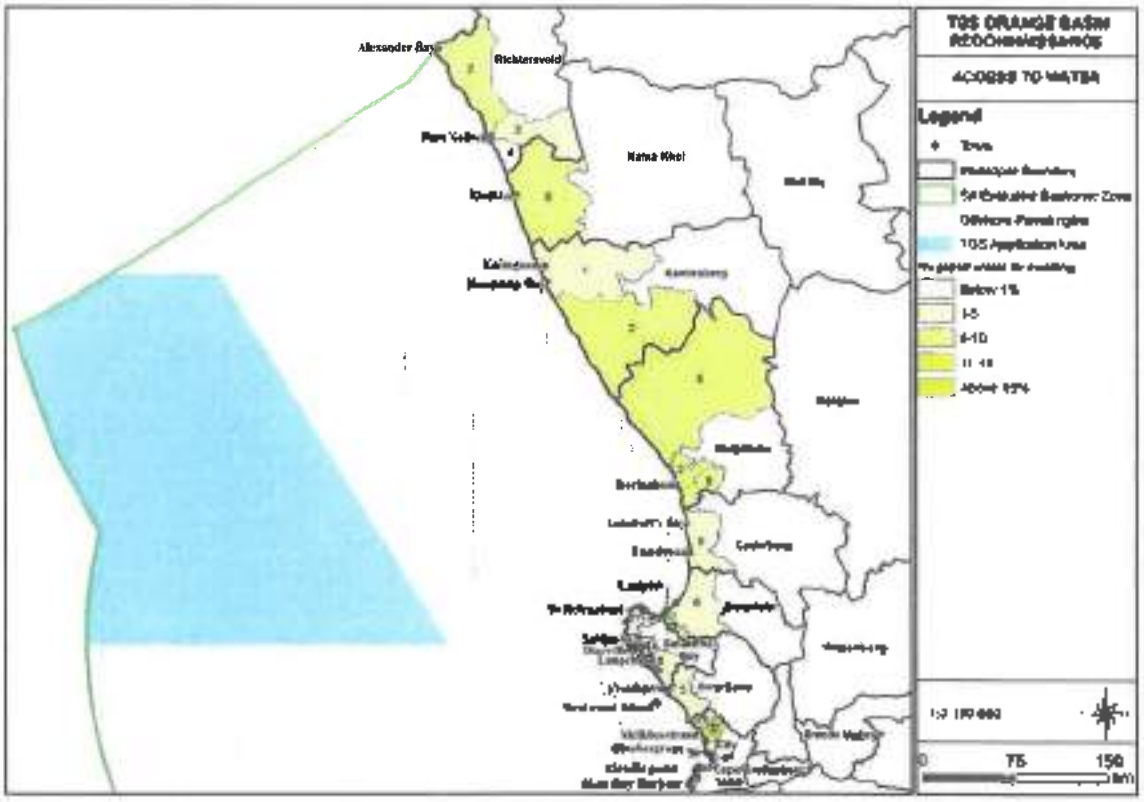

Figure 107: Proportion of households that does not have piped water in the dwelling (shown in percentage, source: Census 2011).

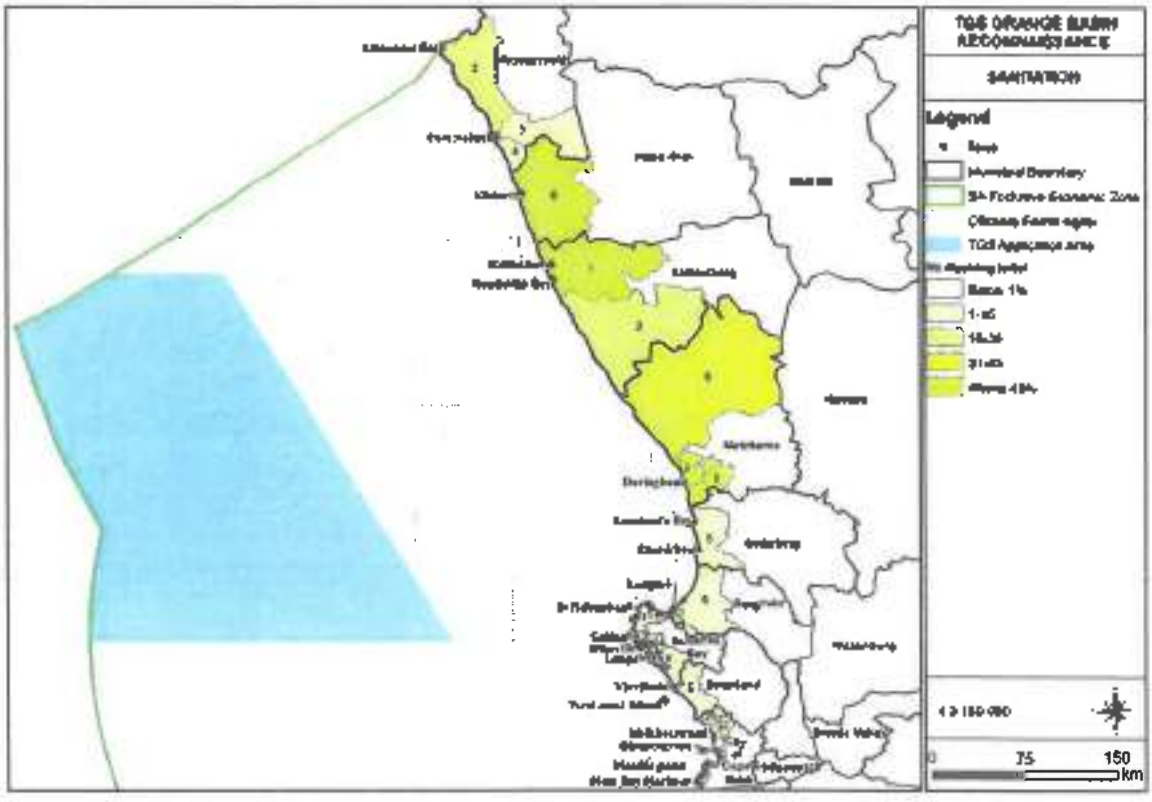

Figure 108: Proportion of households that does not have a flush toilet (shown in percentage, source: Census 2011).

8.7.1.8 ENERGY

Electricity is seen as the preferred lighting source (Noble et al, 2006) and the lack thereof should thus be considered a deprivation. Even though electricity as an energy source may be available, the choice of energy for cooking may be dependent on other factors such as cost. The majority of households have access to electricity for lighting purposes (Figure 109) but a lower proportion use electricity for heating (Figure 110) and cooking (Figure 111) purposes.

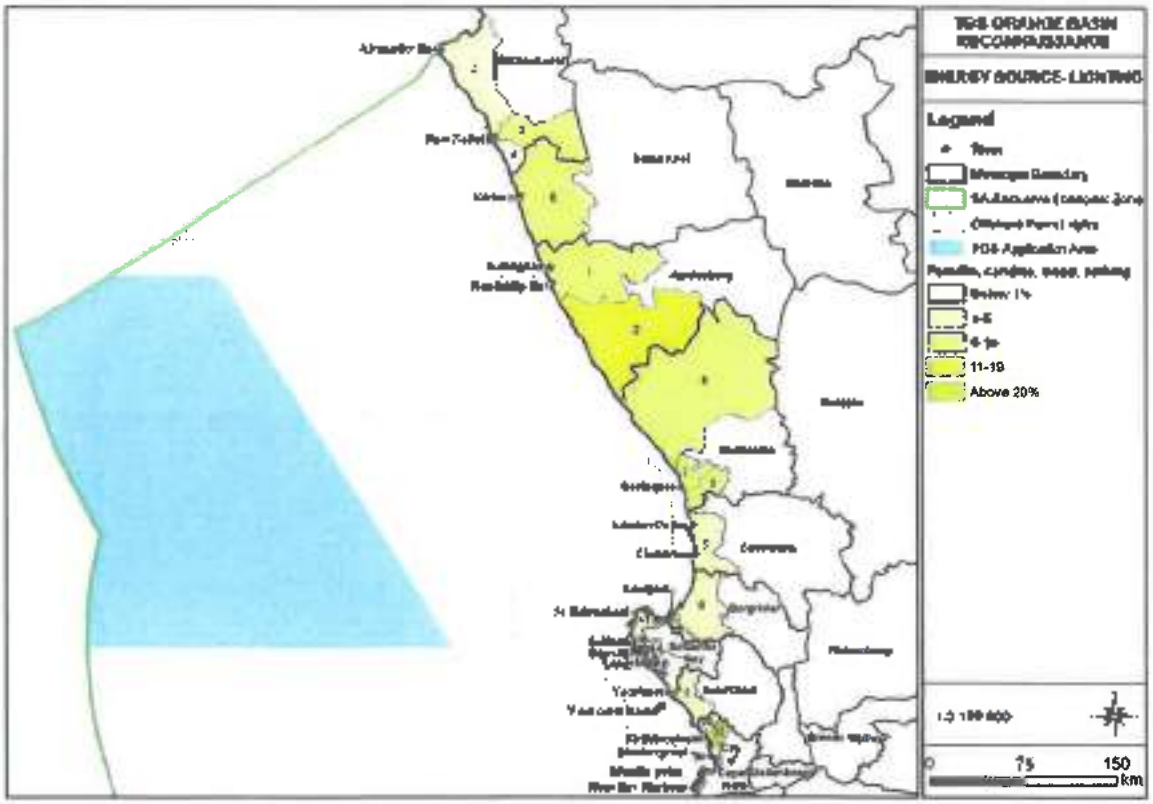

Figure 109: Proportion of households that use paraffin, candles, wood or nothing for lighting purposes (shown in percentage, source: Census 2011).

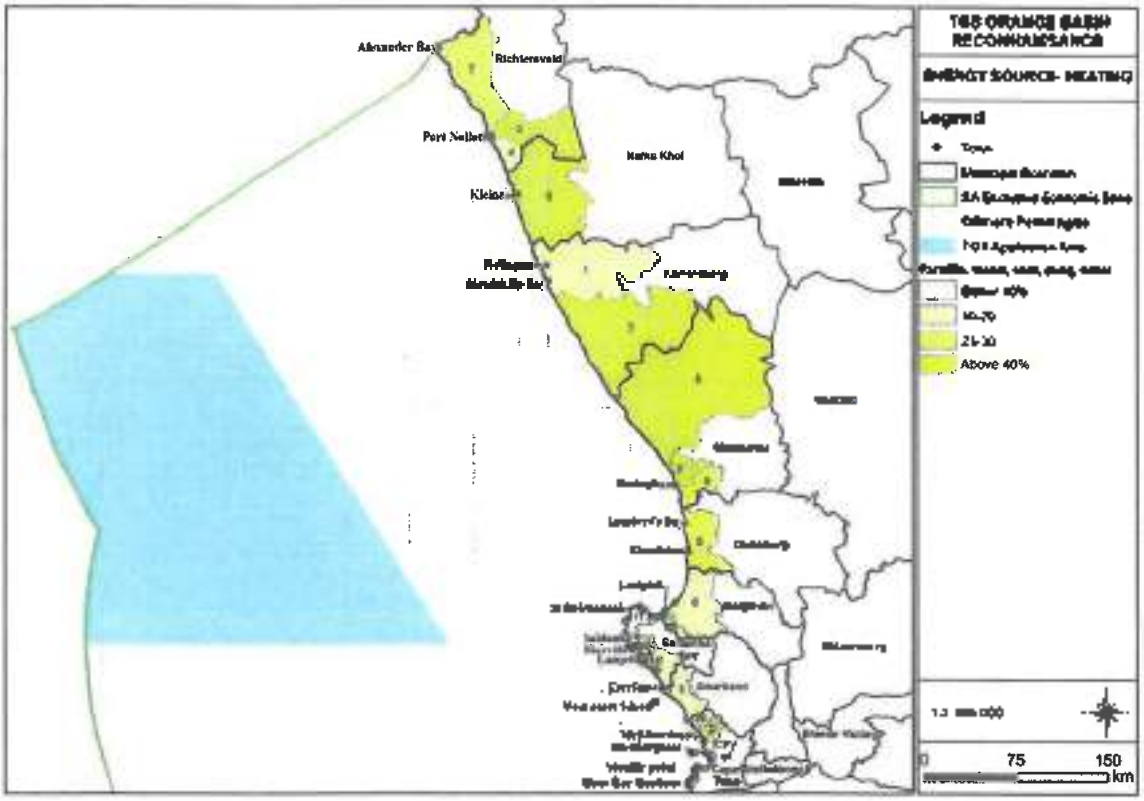

Figure 110: Proportion of households that use paraffin, wood, coal, dung or something else for heating purposes (shown in percentage, source: Census 2011).

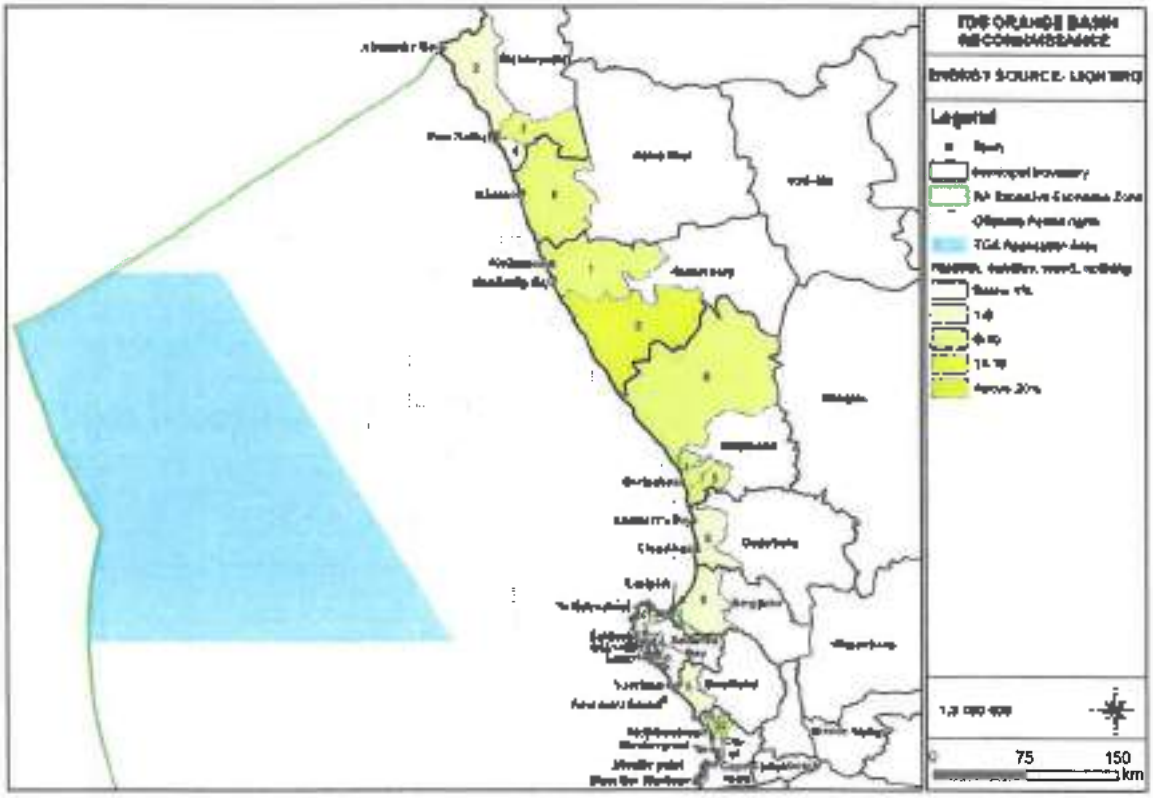

Figure 111: Proportion of households that use paraffin, wood, coal, dung or something else for cooking purposes (shown in percentage, source: Census 2011).

8.7.2 SHIPPING DENSITY

A large number of vessels navigate the major shipping lanes along the South African Coastline. Approximately 95% of the country's exports are conveyed by sea through eight commercial ports. These ports are the conduits for trade between South Africa and its southern African partners as well as hubs for traffic to and from Europe, Asia, the Americas and the east and west coasts of Africa. Figure 112 provides an indication of the shipping density along the South African Coast. It can be observed that the shipping density is generally medium – high over the majority of the Application Area.

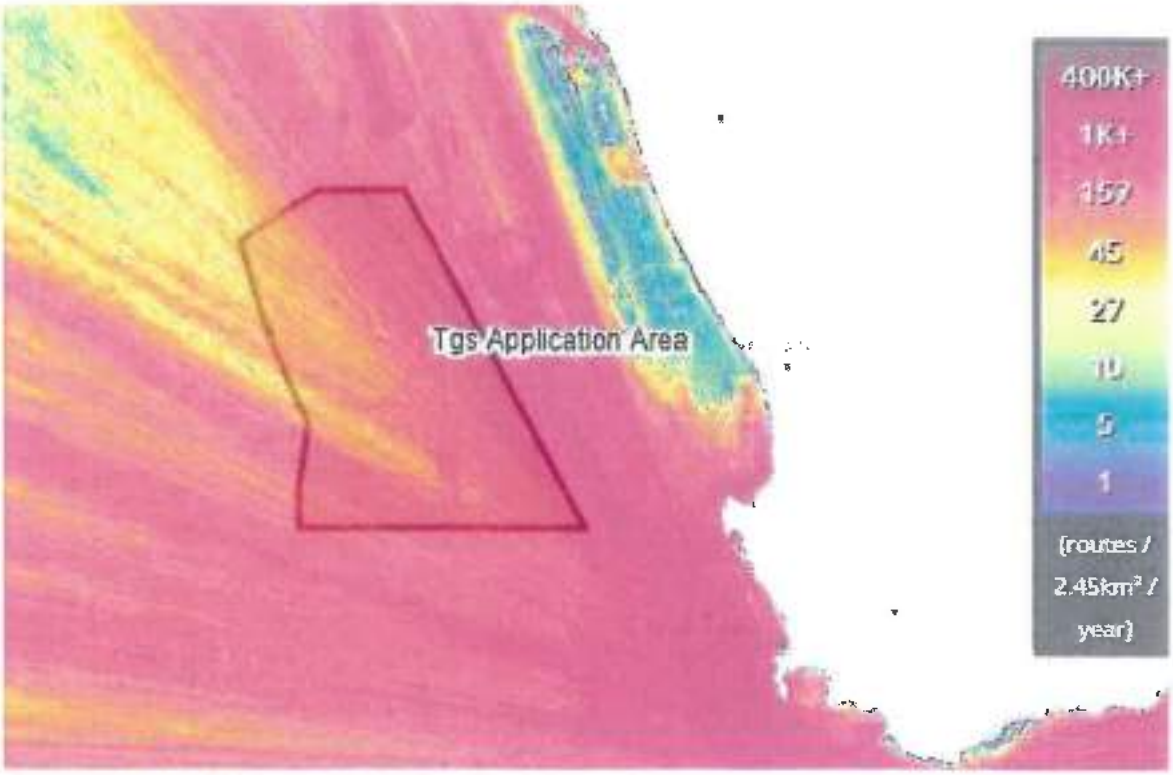

Figure 112: Shipping traffic density along the South African Coast.

8.8 CULTURAL AND HERITAGE RESOURCES

This section provides and overview of the cultural and heritage environment for the study area. The information has been sourced from the Heritage Impact Assessment undertaken by PGS Heritage (Pty) Ltd included in Appendix 5.

Marine resources have a long history of human exploitation. Evidence from archaeological sites suggest that the West Coast region was occupied from the Early Stone Age (ESA) through to the Middle Stone Age (MSA) and Later Stone Age (LSA), up until the arrival of early European settlers from the 16th century onwards. There are numerous sites (including shell middens, stratified cave deposits, rock art, stone tools, and fish traps) recorded along the coast that demonstrate that the rocky shorelines were attractive to hunter-gatherers through time. Much of what we know about settlement, subsistence strategies and diet along the coast is linked to these shorelines. Whilst gorges and stone sinkers are probably the best evidence for technical fishing equipment in the LSA, marine shell middens also demonstrate that the coastal zone was particularly favoured by LSA people (Deacon, 1995).

8.8.1 SHELL MIDDENS

Marine shell middens have been identified within 1 km of the coastline, near estuaries and in dune fields which lie adjacent to rock shores. While pre-historic people likely favoured the rocky shorelines for ease of access to marine resources, middens have also been found further inland, where people would have been able to exploit additional resources such as game life and fresh water.

In some instances, these shell middens are associated with domestic artefactual debris which suggests that they in fact represent occupation sites of long duration. Whilst the opposite can be said for midden sites that do not contain a formal stone artefact component, and instead may represent visits of short duration. These pre-historic people were the ancestors of the San and Khoikhoi. According to archaeologists, several shell middens in the Vredenburg Peninsula are associated with both San and Khoikhoi groups who were harvesting the shorelines and estuaries of the West Coast in a sustainable and patterned manner.

8.8.2 STONE FISH TRAPS

The remains of fish traps (visvywers; stone-walled tidal fish traps) have been recorded along the South African coastline from St Helena Bay to Mossel Bay. Along the south-western coastline, these traps, which use "the tidal range to allow fish to enter pre-built enclosures and be trapped at low tide", provide evidence of early fishing techniques. The preserved fish traps vary in shape, size, and spatial complexity. Identifying the architects of these traps is, however, a contentious issue.

Initially, researchers believed that the fish traps on the south coast were ancient maritime resource systems that originated among LSA people after 2000 years ago with the arrival of Khoikhoi herders. More recent research suggests that the development of fish traps along the southern and western coasts dates to the 19th century. Furthermore, these structures may have been introduced by European farmers as part of the farming-fishing system when intensive exploitation of inshore fish by local farmers occurred. In 1987, Graham Avery recorded a tidal fish trap in Mauritzbaai, south of Jacobsbaai. Hart and Halkett (1992) have also identified the remains of at least six traps in the intertidal zone at Wilde Varkens Valley, St Helena Bay.

8.8.3 INDIGENOUS PEOPLES

Before the colonial era, there were several diverse ancient tribes who traversed the valleys and plains of the present-day West Coast region of South Africa. The origins of the West Coast fishing communities can be traced back to the San and Khoikhoi peoples who lived within this region. Together, the Khoi and the San are the First Peoples of South Africa. In 1928, a German physical anthropologist Leonard Schultze, created the term 'Khoisan', to stress the similarities between the Khoikhoi and the San.

The settlers used the term 'Bushmen' when referring to the San, and many of whom the colonists' called 'Bushmen' were, in fact, Khoikhoi or former Hottentot. Today, this term is considered derogatory, and instead, scholars would rather refer to hunters and herders together as 'Khoisan'. It should be noted that although Khoi and San Peoples may share some experiences, culturally, they remain two distinct groups, and the general preference amongst both Khoi and San people is to be called by their clan names.

8.8.3.1 THE SAN

During almost the entire Holocene period, small groups of San hunter-gatherers were present in southern Africa. The San are the direct descendants of the first peoples of southern Africa. It should be noted that the term "San" is used to cover over a dozen distinct hunter-gatherer groups who speak distinctive "click" languages (incl. the Khwe, !Xun, Ju'hoansi, Naro, Inuu and other groups). These groups lived across Namibia, South Africa, Botswana, and Zimbabwe. The San were small groups of nomadic people who lived by the ethos of "all people are equal". They hunted and gathered resources and did not keep livestock.

It is generally agreed amongst academics that the San were the first inhabitants of the Cape region. During the latter part of the Holocene, there were hunter-gatherers living on the West Coast who made seasonal use of the coastal resources. Several archaeological sites, including Duyker Eiland, which is in Britannia Bay, confirmed the importance of shellfish, seals, marine birds, crayfish, and beached whales as a food source for the local inhabitants during this time.

8.8.3.1.1 THE INTRODUCTION OF THE KHOIKHOI

For thousands of years, the Khoikhoi people have occupied and moved around Southern Africa as nomadic herders. The Khoikhoi were large groups of nomadic herders who owned substantial herds (incl. cattle and sheep) and migrated for pasture, water, and food resources. It is understood that Khoikhoi peoples have a spiritual connection to land, where land is perceived as a gift from nature to be cared for.

Note that the Khoikhoi term is an umbrella term which refers to different tribes. The Khoikhoi people comprise four historical groupings: the Griqua, Nama, Koranna and Cape Khoi (incl. further subgroupings). Today, the Nama people are primarily located in the Northern Cape. The Griqua are in the Western Cape, Eastern Cape,

Kwazulu Natal and Gauteng, and various other parts of the country. The Korana people, live primarily in Kimberly and the Free State. The Cape Khoi are in the Western and Eastern Cape.

Evidence suggests that around 2000 years ago, the pastoralist Khoikhoi entered South Africa along the West Coast into the Cape region. They brought a new way of life, from its northern origins, to South Africa. The Khoikhoi introduced domesticated livestock and new material culture (incl. pottery) into the region. They relied more on sheep as a meat resource and hunted and gathered. Groups living close to the coast would also exploit shellfish, seals, and other marine resources. The St Helena Bay (Skipper Bay) region appears to have provided the Khoikhoi with invaluable resources, including whale meat obtained via 'cetacean traps.

One of the most important West Coast pastoralist sites, Kasteelberg, is an open-air archaeological site located 4 km from the coast. It provides evidence of occupation by herders between 1800 and 1600 years ago (Klein, 1986). The occupants of the site focused on harvesting seals and the presence of sheep bones also indicated that the inhabitants were most likely herding domestic stock.

It is thought that the indigenous people in the Cape populated a region from Northern Namibia to the Cape of Good Hope and from the Atlantic Ocean to the Fish River in the East. The area between Saldanha and Vredenburg was occupied by the CochoQua and the ChariGuriQua (GuriQua) group occupied the lower Berg River area which included St Helena Bay and regions around Piketberg. Some researchers choose to use the term Peninsular Khoikhoi" when referring to the Gorachoquas, Goringhaiquas and the Goringhaiconas ("strandlopers") and "Surrounding Khoikhoi" for the Cochoqua, Chainouqua and Hessequa.

In the pre-colonial era, the relations between the Khoikhoi and the San were relatively stable due to a mutual acknowledgement of territories. Although the San and Khoikhoi seemed to have co-existed for a period, it appears that, to some degree, the San groups were displaced. It's assumed that the Khoikhoi moved into areas that had previously been utilised by the San, thus forcing the San to move into more isolated coastal regions. The San's settlement and subsistence strategy changed from one based on the large-band occupation of open areas and the hunting of large game towards the more intensive utilisation of rock shelters, in small groups and a foraging-based economy. Unfortunately, indigenous groups who lived on the coast were the first people to be severely impacted by colonial oppression.

8.6.3.2 COLONIAL DISPOSSESSION

First contact between indigenous pastoralist groups and Europeans occurred during the 15th and 16th centuries when Portuguese mariners would sail down the coast. Before the Dutch East India Company's ('VOC') governance over the southernmost tip of Africa, European merchants and travellers en route to or from Asia would call in at the natural harbour of Saldanha Bay for refreshment. Encampments were also set up along the coast by survivors of shipwrecks, and in their journals, they would recall how they met and traded with indigenous groups. Written records reveal that in 1497, the GuriQua and the San (SonQua) witnessed the arrival and departure of Vasco da Gama in St Helena Bay. Although the Saldanha Bay harbour was more sheltered than Table Bay and allowed for the crews to trade livestock from the Khoikhoi in the area there was not enough fresh water available to allow for the establishment of large permanent settlements.

It was only in 1652 that the VOC decided to occupy the Cape and establish the first permanent European settlement in South Africa. The VOC established a station at Table Bay to supply Company fleets travelling between Europe and the Indies with refreshments (i.e., meat, wheat, vegetables, and freshwater) (Ward, 2009). When the Dutch colonists arrived, they encountered several Khoikhoi groups. The largest concentration of Khoikhoi lived in the lush pasture lands of the south-western Cape region.

Initially, the relationship between the Dutch and the Khoikhoi was one of cooperation, and the VOC established trading agreements with local chiefs to get regular supplies of fresh meat (Elphick, 1977). As the colony grew, the VOC decided to decrease their dependency on local trade with the Khoikhoi. Their alternative plan was to give land to free burghers to supply meat and grain to the Company.

Khoikhoi and San lives were impacted upon by both internal strife and direct conflict with the Europeans over the disregard of traditional customs, the privatisation of land, and exhausting indigenous resources (i.e., overfishing and farming). As the Dutch took over more of the Khoikhoi's grazing land for farms, much of the Khoikhoi and San peoples' traditional lands were dispossessed. In 1657, the Goringhaiqua tribe were ordered to move to the east of the Liesbeeck boundary and this 'eviction' event would be instrumental for the first war against colonial intrusion (Bredekamp and Newton-King, 1984). The First Khoikhoi-Dutch War lasted the whole of 1659.

According to Sleigh (1993: 148), "In 1672, two sons of the weakened Peninsular Khoisan chiefs signed a contract, which they probably did not fully understand, and sold huge tracts of land from Table Bay to Saldanha Bay in the North and to the Hottentots Hollands mountains in the East to the VOC for an incredible low price (which they did not even fully receive)".

After a few more instances of territories being ignored and further land appropriation, another war of resistance was initiated by the Cochoqua, and the Second Khoikhoi-Dutch War commenced (1673-1677). This led to more Khoikhoi groups being forced to relocate to areas further up the coast. According to writings of early settlers, it appears that some San groups, who pursued a hunting and foraging lifestyle, may have still resided in the mountainous regions of the Cape where they were less likely to clash with the Khoi or Dutch settlers. Regions that were less desirable for the colonists, such as Namaqualand, became places of refuge for the San and Khoikhoi who were able to continue many aspects of their traditional ways of life in this area for some time.

In 1713, the small-pox epidemic led to the death of many Khoikhoi people living in the south-western Cape. The surviving Khoisan became assimilated as domestic/farm workers due to the high demand for labour by the Dutch. In rural areas, the Khoisan were forced into what was referred to as semi-bonded labour. By the late 18th century, the Cape settler colony's territories incorporated the Berg (c. 1700), Olifants (1750), and Buffels (1798) rivers.

8.8.3.3 THE HISTORY OF FISHING ON THE WEST COAST

This section describes the history of fishing along the West Coast of South Africa.

8.8.3.3.1 17TH CENTURY

During the 17th century, the VOC established an outpost at St Helena Bay. From 1670, free burgers started to fish regularly in St Helena Bay. They introduced methods to the region that were not previously available to indigenous fisherman, such as metal hooks, boats, nets and bulk processing and storage.

8.8.3.3.2 18TH CENTURY

During the 18th century, the Cape settler's economy was primarily based on slave labour which was imported from Asia and East Africa. The agricultural sector which was maintained by free burghers (freed from Company service) was not stable and due to the trade of the Khoikhoi's livestock being intermittent, the settlers had to make alternative arrangements for food resources. This led to Robben Island being exploited for seals, penguins, and seabirds. Large rural landowners established private coastal fishing posts to supply marine resources to the Company; the local region; passing ships and for export. Soon, Dassen Island, Saldanha Bay and St Helena Bay developed as significant centres to supply the VOC with additional resources to sustain the growing number of people in the Cape colony, including the substantial number of slaves kept by the Company. According to Sleigh (1993), the slaves were given salted fish, seal meat, penguin, and bird eggs whilst the rest of the colony preferred to consume meat.

According to Marincowitz (1985: 40–46) "With exclusive land grants closing the north-western frontier, from the 1740s growing numbers of ex-slaves, dispossessed Khoekhoe, failed farmers, evicted tenants and bywoners (tenant farmers), new immigrants and fugitives from colonial and military justice moved onto the beaches of the west coast". Early fishing, sealing and whaling activities, by European and American whalers, around Saldanha Bay, especially near Marcus Island/Outer Bay and at Salamander Point, have been extensively documented in the archival/historical record. Although the inshore whale population declined after 1830, processing continued at Donkergat in Saldanha Bay.

8.8.3.3.3 19TH CENTURY

By the mid-19th century, scattered subsistence communities had emerged along the West Coast. Before the arrival of industrial fisheries, residents in St Helena Bay employed basic fishing technology (small-scale line fishing, beach seine nets and rowing boats) and fishing activities were informally organized by boat and net owners.

Malay slaves and other residents moved into the region to work as farm labourers. Over time, the unique fishing skills of enslaved Malay people intermingled with the fishing skills of the indigenous people. This led to the establishment of small fishing villages along the West Coast (incl. Saldanha, Langebaan and St Helena Bay).

After the emancipation of slaves, new laws were introduced to control both the freedom of movement and independent livelihoods of people who did not own land. This forced fishermen on the West Coast "to either

develop artisanal skills, become wage labourers or squat on coastal government land to eke out a living from small-scale production and seasonal work".

Using business capital in both the local and international markets, entrepreneurs were able to lease Crown land and establish coastal industries along the West Coast. By the 1890s, a Cape Town-based trading company, Stephan Brothers, was able to monopolise the West Coast trade. The company bought the main grain shipping points along the West Coast, including the southern shore of St Helena Bay, where they established Laaiplek (translated to 'loading place') at the mouth of the Berg River.

8.8.3.3.4 20th CENTURY

Although the local fishing industry on the West Coast employed a substantial number of locals at the start of the 20th century, the industry is associated with a history of hardship. The industry's collapse in the mid-20th century left numerous West Coast communities impoverished. Despite all the obstacles thrown at them, the West Coast fishing communities were resilient and continued their fishing tradition throughout the 20th century.

Historically, small-scale fishers have constantly had to compete against big scale fisheries. For example, Piketberg coastal fisheries used a method of fishing called beach seining to supply inland farmers with cheap ration fish. When there was a decline in snoek sources further south, Italian immigrant fishermen from Cape Town travelled up the West Coast on boats with set nets. Ultimately, their method of fishing impacted the supply of fish for the sedentary fishermen.

By 1900, the Stephan Brothers company were in control of nearly every suitable bay from Saldanha Bay to Lamberts Bay. They also owned numerous farms which were often acquired in exchange for debt. In 1909, the company negotiated an agreement with the State to establish an Exclusive Trek Seine Fishing Zone along the Malmesbury coast. This move meant that the company was able to dominate a new manufacturing industry which further exacerbated resource owners and local fishermen.

During World War One, there was a crayfish canning boom in the Cape. The sourcing of crayfish moved rapidly up the West Coast during this period. By the early 1920s, the overexploitation of crayfish resulted in an exhaustion of crayfish stocks and West Coast factories were forced to close. This meant that the small-scale seine fishermen, and fishermen who netted in the backwaters, were left even more vulnerable to the financial depression of the 1930s.

Then, in 1934, in an act of retaliation, "Saldanha Bay fishermen invaded the Piketberg area on motorboats carrying Italian lampara nets and, with the support of Government, wiped out the non-motorised Berg River inshore fisheries run by consortiums of farmers, fishery owners and canners". In 1951, increasing catches along the West Coast, meant that both skippers and fishermen yielded good financial returns. By 1955, South Africa had the largest fishing industry in the southern hemisphere.

With the Apartheid system arriving, the indigenous identity of the Khoisan was further disrupted through the Race Classification Act and the Populations Registration Act. The Khoisan were forcibly categorised as "Coloured". This label further dispossessed the people from their heritage. Under the Group Areas Act (1950) the towns of the West Coast were divided into segregated residential and business areas. The forced removals marked yet another era of forced removals from areas that indigenous people occupied. Despite the discrimination, the communities continued their tradition of fishing that had been passed on through the generations of fisher families.

8.8.3.3.5 MARITIME HERITAGE RESOURCES

The following section was developed by maritime archaeologist Vanessa Maitland.

The first recorded European voyages down the west coast of Africa were by the Portuguese. When the first Portuguese explorers travelled down the west African coast, they stuck close to the coastline, to map the land. However, occasionally they were swept towards the Americas, as is evident by the fate of the fleet of Pedro Alvares Cabral, in 1500. This was first Portuguese fleet which was to sail annually to the Indies. Twenty days after the fleet left Brazil, which they had "discovered", it was struck by storms and four ships, including the one under command of Bartolomeu Dias, foundered somewhere in the southern Atlantic. Different researchers put them anywhere between Tristan da Cunha and the Cape.

Bartolomeu Dias and his fleet passed the Orange River Mouth in 1487/1488 (Axelson, 1973). Thereafter, the rate of exploration and trade increased exponentially, as is evidenced by the increase in shipwrecks over the centuries. These early voyages were not well documented, and the archives often merely report that a fleet of

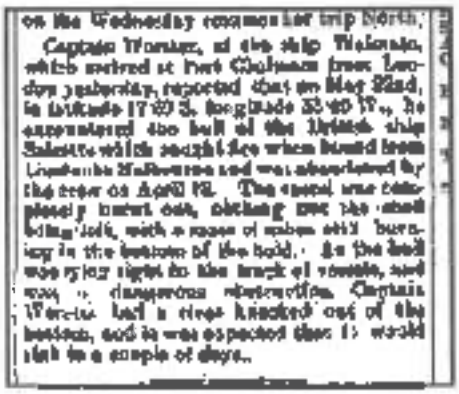
a certain number of vessels left and only a certain amount returned, with only vague references to their place and manner of loss. Therefore, there are many undocumented wrecks, along the coastline and even more offshore.

There is some anecdotal evidence that the Phoenicians circumnavigated Africa (Herodotus, 1954). If this is true, these ships had to stick right to the coastline and therefore are likely to be inshore. There's increasing evidence that the Chinese voyages of the 1400s explored parts, if not all, of the African coast (Paine, 2003). However, once again the archival evidence to date, and availability to Western researchers, limits this knowledge.

There are many ships that are only recorded as having disappeared between Europe and the Far East and Americas. As well as between local ports. The mechanics of sailing vessels and winds meant that for a ship to get from Europe to the Cape, they often sailed via South America. There are also numerous missing U-boats and other war vessels from WW1 and WW2 that may be found.

Thousands of ships have disappeared in the southern Atlantic Ocean, a portion of these can be seen in Figure 113. There are numerous historical reports of abandoned vessels being seen by other ships (Figure 114).

Figure 113 - A portion of the ships wrecked off South Africa and in the southern Atlantic.



on the Wednesday commenced trip North.

Captain Worster, of the ship Waimate, which arrived at Port Chalmers from London yesterday, reported that on May 22nd, in latitude 17° S., longitude 35° 40' W., he encountered the hull of the British ship Salsette which sailed for Wellington from Liverpool with coal for Melbourne and was abandoned by the crew on April 28. The vessel was completely burnt out, nothing but the shell being left, with a mass of ashes and burning in the bottom of the hold. As the hull was lying right in the track of vessels, and was a dangerous obstruction, Captain Worster had a rope knocked out of the bottom, and it was expected that it would sink in a couple of days.

Figure 114 - Report in The Auckland Star 26-07-1895, by the Waimate on the drifting hulk of the Salsette.

8.8.4 INTANGIBLE HERITAGE

Intangible heritage' (also referred to as 'Living Heritage') is a term which is used to describe "aesthetic, spiritual, symbolic or other social values people may associate with a site, as well as rituals, music, language, know-how, oral traditions and the cultural spaces in which these 'living heritage' traditions are played out." Through its efforts to safeguard intangible heritage UNESCO and its member states developed the Convention for the Safeguarding of the Intangible Cultural Heritage (ICHC). The following section is extracted from a UNESCO webpage that explains the importance of Intangible Heritage:

"While fragile, intangible cultural heritage is an important factor in maintaining cultural diversity in the face of growing globalization. An understanding of the intangible cultural heritage of different communities helps with intercultural dialogue and encourages mutual respect for other ways of life.

The importance of intangible cultural heritage is not the cultural manifestation itself but rather the wealth of knowledge and skills that is transmitted through it from one generation to the next. The social and economic value of this transmission of knowledge is relevant for minority groups and for mainstream social groups within a State, and is as important for developing States as for developed ones.

Intangible heritage is:

- Traditional, contemporary, and living at the same time: intangible cultural heritage does not only represent inherited traditions from the past but also contemporary rural and urban practices in which diverse cultural groups take part.
- Inclusive: we may share expressions of intangible cultural heritage that are similar to those practised by others. Whether they are from the neighbouring village, from a city on the opposite side of the world, or have been adapted by peoples who have migrated and settled in a different region, they all are intangible cultural heritage. They have been passed from one generation to another, have evolved in response to their environments and they contribute to giving us a sense of identity and continuity, providing a link from our past, through the present, and into our future. Intangible cultural heritage does not give rise to questions of whether or not certain practices are specific to a culture. It contributes to social cohesion, encouraging a sense of identity and responsibility which helps individuals to feel part of one or different communities and to feel part of society at large.
- Representative: intangible cultural heritage is not merely valued as a cultural good, on a comparative basis, for its exclusivity or its exceptional value. It thrives on its basis in communities and depends on those whose knowledge of traditions, skills and customs are passed on to the rest of the community, from generation to generation, or to other communities.
- Community-based: intangible cultural heritage can only be heritage when it is recognized as such by the communities, groups or individuals that create, maintain and transmit it – without their recognition, nobody else can decide for them that a given expression or practice is their heritage."

In this assessment, marine-related intangible cultural heritage and people's connection to the ocean is relevant. This type of heritage incorporates the unique ethos and identity of specific places linked with fishing villages; oral history; popular memory; cultural traditions; indigenous knowledge systems, rituals, beliefs, and practices (e.g., fishing techniques) associated with the ocean.

In some cultures, the ocean is regarded as a spiritual realm filled with healing powers and also a means to connect to one's ancestors. Gable (2014) explains how water is the Khoisan's "...'source of life, a sense of belonging and their permanence to nature'. Water is vital for various rituals and cleansing ceremonies. According to Boswell and Thornton (2021), the Khoisan "advocate for deep connections and complementarity between humans and nature, recognising the agency and 'direction' provided by nature to humanity".

Considering that the ICHC emphasises the declaration and listing of forms of Intangible Heritage, it can lead to a diminished recognition of intangible heritage not listed or formally recognised. The ICHC requires a State Party to develop an inventory of intangible heritage within their country or territory and then take measures to safeguarding with community participation. As Smith (2015) argues, the European Authorised Heritage Discourse within UNESCO emphasises the declaration and the importance of heritage and things as defined by experts or those entities and nation states promoting their discourse. The ICHC, however, did provide the opportunity for communities on a sub-national level to promote and give legitimacy to their intangible heritage. Unfortunately, the ICHC and its operational standards place the responsibility of assessment, nomination, and

listing on the State Parties. This leads to a gatekeeper process in which these Parties can decide and control what is listed and nominated through their national discourse to the detriment of the community or grouping. The Khoisan has historical experienced marginalisation and stigmatisation since the onset of colonialisation in Southern Africa.

Natural Justice (2016) submitted that strides were made in the recognition and legitimising of the Khoisan. However, entrenched continuing historic race classifications and the lack of leadership recognition through such issues as the dragging finalisation of the Traditional and Khoi-San Leadership Bill is robbing these communities of a voice and standing within the larger South African landscape. This speaks to the recognition of their culture that is inclusive of tangible and intangible heritage.

9 ENVIRONMENTAL IMPACT ASSESSMENT

9.1 IMPACT ASSESSMENT METHODOLOGY

The impact significance rating methodology, as provided by EMS, is guided by the requirements of the NEMA EIA Regulations 2014 (as amended). The broad approach to the significance rating methodology is to determine the environmental risk (ER) by considering the consequence / of each impact (comprising Nature, Extent, Duration, Magnitude, and Reversibility) and relate this to the probability/ likelihood (P) of the impact occurring. This determines the environmental risk. In addition, other factors, including cumulative impacts and potential for irreplaceable loss of resources, are used to determine a prioritisation factor (PF) which is applied to the ER to determine the overall significance (S). The impact assessment will be applied to all identified alternatives. Where possible, mitigation measures will be recommended for impacts identified.

9.1.1 DETERMINATION OF ENVIRONMENTAL RISK

The significance (S) of an impact is determined by applying a prioritisation factor (PF) to the environmental risk (ER). The environmental risk is dependent on the consequence / of the particular impact and the probability (P) of the impact occurring. Consequence is determined through the consideration of the Nature (N), Extent (E), Duration (D), Magnitude (M), and reversibility (R) applicable to the specific impact.

For the purpose of this methodology the consequence of the impact is represented by:

$$C = \frac{(E + D + M + R) * N}{4}$$

Each individual aspect in the determination of the consequence is represented by a rating scale as defined in Table 35 below.

Table 35: Criteria for Determining Impact Consequence.

Aspect	Score	Definition
Nature	-1	Likely to result in a negative/ detrimental impact
	+1	Likely to result in a positive/ beneficial impact
Extent	1	Activity (i.e. limited to the area applicable to the specific activity)
	2	Site (i.e. within the development property boundary).
	3	Local (i.e. the area within 5 km of the site).
	4	Regional (i.e. extends between 5 and 50 km from the site
	5	Provincial / National (i.e. extends beyond 50 km from the site)
Duration	1	Immediate (<1 year)
	2	Short term (1-5 years),
	3	Medium term (6-15 years).
	4	Long term (the impact will cease after the operational life span of the project).
	5	Permanent (no mitigation measure of natural process will reduce the impact after construction).

5428

Aspect	Score	Definition
Magnitude/ Intensity	1	Minor (where the impact affects the environment in such a way that natural, cultural and social functions and processes are not affected).
	2	Low (where the impact affects the environment in such a way that natural, cultural and social functions and processes are slightly affected).
	3	Moderate (where the affected environment is altered but natural, cultural and social functions and processes continue albeit in a modified way).
	4	High (where natural, cultural or social functions or processes are altered to the extent that it will temporarily cease), or
	5	Very high / don't know (where natural, cultural or social functions or processes are altered to the extent that it will permanently cease).
Reversibility	1	Impact is reversible without any time and cost.
	2	Impact is reversible without incurring significant time and cost.
	3	Impact is reversible only by incurring significant time and cost.
	4	Impact is reversible only by incurring prohibitively high time and cost.
	5	Irreversible impact

Once the C has been determined the ER is determined in accordance with the standard risk assessment relationship by multiplying the C and the P. Probability is rated/ scored as per Table 36.

Table 36: Probability Scoring.

Probability	1	Improbable (the possibility of the impact materialising is very low as a result of design, historic experience, or implementation of adequate corrective actions; <25%),
	2	Low probability (there is a possibility that the impact will occur; >25% and <50%),
	3	Medium probability (the impact may occur; >50% and <75%),
	4	High probability (it is most likely that the impact will occur- > 75% probability), or
	5	Definite (the impact will occur),

The result is a qualitative representation of relative ER associated with the impact. ER is therefore calculated as follows:

$$ER = C \times P$$

Table 37: Determination of Environmental Risk.

Consequence						
	5	5	10	15	[illegible]	[illegible]
	4	4	8	12	16	[illegible]
	3	3	6	9	12	15
	2	2	4	6	8	10

	1	1	2	3	4	5
		1	2	3	4	5
	Probability					

The outcome of the environmental risk assessment will result in a range of scores, ranging from 1 through to 25. These ER scores are then grouped into respective classes as described in Table 38.

Table 38: Significance Classes.

Risk Score	Description
< 10	Low (i.e. where this impact is unlikely to be a significant environmental risk).
≥ 10; < 20	Medium (i.e. where the impact could have a significant environmental risk).
≥ 20	High (i.e. where the impact will have a significant environmental risk).

The impact ER will be determined for each impact without relevant management and mitigation measures (pre-mitigation), as well as post implementation of relevant management and mitigation measures (post-mitigation). This allows for a prediction in the degree to which the impact can be managed/mitigated.

9.1.2 IMPACT PRIORITISATION

Further to the assessment criteria presented in the section above, it is necessary to assess each potentially significant impact in terms of:

1. Cumulative impacts; and
2. The degree to which the impact may cause irreplaceable loss of resources.

To ensure that these factors are considered, an impact prioritisation factor (PF) will be applied to each impact ER (post-mitigation). This prioritisation factor does not aim to detract from the risk ratings but rather to focus the attention of the decision-making authority on the higher priority/significance issues and impacts. The PF will be applied to the ER score based on the assumption that relevant suggested management/mitigation impacts are implemented.

Table 39: Criteria for Determining Prioritisation.

Cumulative Impact (CI)	Low (1)	Considering the potential incremental, interactive, sequential, and synergistic cumulative impacts, it is unlikely that the impact will result in spatial and temporal cumulative change.
	Medium (2)	Considering the potential incremental, interactive, sequential, and synergistic cumulative impacts, it is probable that the impact will result in spatial and temporal cumulative change.
	High (3)	Considering the potential incremental, interactive, sequential, and synergistic cumulative impacts, it is highly probable/ definite that the impact will result in spatial and temporal cumulative change.
Irreplaceable Loss of Resources (LR)	Low (1)	Where the impact is unlikely to result in irreplaceable loss of resources.
	Medium (2)	Where the impact may result in the irreplaceable loss (cannot be replaced or substituted) of resources but the value (services and/or functions) of these resources is limited.

	High (3)	Where the impact may result in the irreplaceable loss of resources of high value (services and/or functions).

The value for the final impact priority is represented as a single consolidated priority, determined as the sum of each individual criteria represented in Table 39. The impact priority is therefore determined as follows:

$$Priority = CI + LR$$

The result is a priority score which ranges from 2 to 6 and a consequent PF ranging from 1 to 1.5 (Refer to Table 40).

Table 40: Determination of Prioritisation Factor.

Priority	Ranking	Prioritisation Factor
2	Low	1
3	Medium	1.125
4	Medium	1.25
5	Medium	1.375
6	High	1.5

In order to determine the final impact significance, the PF is multiplied by the ER of the post mitigation scoring. The ultimate aim of the PF is an attempt to increase the post mitigation environmental risk rating by a full ranking class, if all the priority attributes are high (i.e. if an impact comes out with a medium environmental risk after the conventional impact rating, but there is significant cumulative impact potential and significant potential for irreplaceable loss of resources, then the net result would be to upscale the impact to a high significance).

Table 41: Environmental Significance Rating

Value	Description
< -10	Low negative (i.e. where this impact would not have a direct influence on the decision to develop in the area).
≥ -10 < -20	Medium negative (i.e. where the impact could influence the decision to develop in the area).
≥ -20	High negative (i.e. where the impact would have an influence on the decision process to develop in the area).
0	No impact
< 10	Low positive (i.e. where this impact would not have a direct influence on the decision to develop in the area).
≥ 10 < 20	Medium positive (i.e. where the impact could influence the decision to develop in the area).

Value	Description
≥ 20	High positive (i.e. where the impact must have an influence on the decision process to develop in the area).

The significance ratings and additional considerations applied to each impact will be used to provide a quantitative comparative assessment of the alternatives being considered. In addition, professional expertise and opinion of the specialists and the environmental consultants will be applied to provide a qualitative comparison of the alternatives under consideration. This process will identify the best alternative for the proposed project.

9.2 IMPACTS IDENTIFIED

This Section presents the impacts that have been assessed for the BA. Potential environmental impacts were identified by the EAP, the appointed specialists, as well as the preliminary input from the public. The impacts are included in Table 42 below. It should be noted that this report will be made available to I&AP's for review and comment and their comments and concerns will be addressed in the final BA Report submitted to the PASA/DMRE for adjudication.

The impacts were assessed in terms of nature, significance, consequence, extent, duration and probability in line with the methodology described in Section 9.1 above. The impact assessment matrix (including pre- and post-mitigation assessment) is included in Appendix 4. Without proper mitigation measures and continual environmental management, most of the identified impacts may potentially become cumulative, affecting areas outside of their originally identified zone of impact. The potential cumulative impacts have been identified, evaluated, and mitigation measures suggested and have been updated during the investigation.

When considering cumulative impacts, it is important to bear in mind the scale at which different impacts occur. There is potential for a cumulative effect at a broad scale, such as regional deterioration of air quality, as well as finer scale effects occurring in the area surrounding the activity. The main impacts which have a cumulative effect on a regional scale are related to the transportation vectors that they act upon. For example, air movement patterns result in localised air quality impacts having a cumulative effect on air quality in the region. Similarly, water acts as a vector for distribution of impacts such as contamination across a much wider area than the localised extent of the impacts source. At a finer scale, there are also impacts that have the potential to result in a cumulative effect, although due to the smaller scale at which these operate, the significance of the cumulative impact is lower in the broader context.

With reference to Table 29 in Section 8.5.4 above, it should be noted that there are only two fishing sectors that operate within the application area – i.e. the Large Pelagic Longline Sector and the Tuna Pole-Line Sector. As a result, it is anticipated that there will be no impacts on the remaining fisheries sectors described in Section 8.5 above and the impacts on these sectors have not been assessed further.

Table 42: Impacts Identified and Assessed during the BA

#	Impact	Phase
1	Impacts of seismic noise on mysticetes and odontocetes	Operation
2	Impacts of seismic noise on seals	Operation
3	Impacts of seismic noise on turtles	Operation
4	Impacts of seismic noise on diving seabirds	Operation
5	Impacts of seismic noise to pelagic fish	Operation
6	Impacts of seismic noise to marine invertebrates	Operation
7	Impacts of seismic noise to plankton and ichthyoplankton	Operation

J403

#	Impact	Phase
8	Disturbance and behavioural changes in seabirds, seals, turtles and cetaceans due to vessel noise	Operation
9	Disturbance and behavioural changes in seabirds, seals, turtles and cetaceans due to noise of support aircraft	Operation
10	Disturbance and behavioural changes in pelagic fauna due to vessel lighting	Operation
11	Impacts of marine biodiversity through the introduction of non-native species in ballast water and on ship hulls	Operation
12	Impacts of normal vessel discharges on marine fauna	Operation
13	Impacts on turtles and cetaceans due to ship strikes, collision and entanglement with towed equipment	Operation
14	Impacts on benthic and pelagic fauna due to accidental loss of equipment to the seabed or the water column	Operation
15	Impacts of an operational spill or collision on marine fauna	Operation
16	Impacts of exclusion from fishing ground on the large pelagic longline sector due to the safety zone around the survey vessel	Operation
17	Impact of Exclusion of the Tuna Pole-Line Sector from access to Fishing Ground	Operation
18	Impact of Underwater Sound on the Large Pelagic Longline Sector	Operation
19	Impact of Underwater Sound on the Tuna Pole-Line Sector	Operation
20	Impacts of an operational spill on the large pelagic longline sector	Operation
21	Impacts of the unplanned loss of equipment to sea from the survey vessel	Operation
22	Impacts on Cultural Heritage	Operation
23	Impacts of an operational spill or collision on marine fauna	Operation
24	Impacts on Cultural Heritage	Operation
25	Uncertainty	Planning
26	Concerns about cumulative impacts	Planning
27	Further marginalisation of vulnerable groups	Planning
28	Stakeholder fatigue and disillusionment	Planning
29	Perceived impact on livelihoods	Operation
30	Impacts on sense and spirit of place	Operation
31	Impacts on social licence to operate	Operation
32	Community expectations	Operation
33	Social unrest	Operation

9.3 DESCRIPTION AND ASSESSMENT OF IMPACTS

This section lists the potential impacts were identified during the BA based on the methodology described above. The impact assessment matrix is included in Appendix 9 and the below subsections describe each impact in more detail.

No separate noise impact assessment ratings are included in this report. The noise modelling results from the noise (acoustic) assessment are used entirely to inform the other specialist impacts, specifically the impacts on marine ecology and fisheries. Refer to Section 11.1.1.

9.3.1 IMPACTS ON MARINE ECOLOGY

This section provides a description of the Marine Ecological Impacts identified by in the Marine Ecological Study and Sound Transmission Loss Modelling Study. For a more detailed description of the impacts, please refer to the Marine Ecological Assessment and Acoustics Sound Transmission Loss Modelling Study undertaken by Pisces Environmental Services (Pty) Ltd included in Appendix 3.

9.3.1.1 ACOUSTIC IMPACTS OF SEISMIC SURVEYS ON MARINE FAUNA

The ocean is a naturally noisy place and marine animals are continually subjected to both physically produced sounds from sources such as wind, rainfall, breaking waves and natural seismic noise, or biologically produced sounds generated during reproductive displays, territorial defence, feeding, or in echolocation.

Acoustic cues are thought to be important to many marine animals in the perception of their environment as well as for navigation purposes, predator avoidance, and in mediating social and reproductive behaviour. Anthropogenic sound sources in the ocean can thus be expected to interfere directly or indirectly with such activities thereby affecting the physiology and behaviour of marine organisms. Of all human-generated sound sources, the most persistent in the ocean is the noise of shipping. Depending on size and speed, the sound levels radiating from vessels range from 160 to 220 dB re 1 µPa at 1 m. Especially at low frequencies between 5 to 100 Hz, vessel traffic is a major contributor to noise in the world's oceans, and under the right conditions, these sounds can propagate hundreds of kilometres thereby affecting very large geographic areas.

As the Application Area is located within the main offshore shipping routes that pass around southern Africa, the shipping noise component of the ambient noise environment is expected to be significant within and around the Application Area. For the duration of the survey an exclusion zone would be established around the survey vessel. Given the significant local shipping traffic and relatively strong metocean conditions specific to the area, ambient noise levels are expected to be 90–130 dB re 1 µPa for the frequency range 10 Hz – 10 kHz.

The seismic sources used in modern seismic surveys produce some of the most intense non-explosive sound sources used by humans in the marine environment. However, the transmission and attenuation of seismic sound is probably of equal or greater importance in the assessment of environmental impacts than the produced source levels themselves, as transmission losses and attenuation are very site specific, and are affected by propagation conditions, distance or range, water and receiver depth and bathymetrical aspect with respect to the source array. In water depths of 25 – 50 m seismic sources are often audible above ambient noise levels to ranges of 50 – 75 km, and with efficient propagation conditions such as experienced on the continental shelf or in deep oceanic water, detection ranges can exceed 100 km and 1,000 km, respectively. The signal character of seismic source pulses also change considerably with propagation effects. Reflective boundaries include the sea surface, the sea floor and boundaries between water masses of different temperatures or salinities, with each of these preferentially scattering or absorbing different frequencies of the source signal. This results in the received signal having a different spectral makeup from the initial source signal. In shallow water (<50 m) at ranges exceeding 4 km from the source, signals tend to increase in length from <30 milliseconds, with a frequency peak between 10-100 Hz and a short rise time, to a longer signal of 0.25-0.75 seconds, with a downward frequency sweep of between 200 – 500 Hz and a longer rise time.

In contrast, in deep water received levels vary widely with range and depth of the exposed animals, and exposure levels cannot be adequately estimated using simple geometric spreading laws. McCauley *et al* found that the received levels fell to a minimum between 5 – 9 km from the source and then started increasing again at ranges between 9 – 13 km, so that absolute received levels were as high at 12 km as they were at 2 km. With the complex sound reception fields arising from multi-path sound transmission.

Acoustic pressure variation is usually considered the major physical stimulus in animal hearing, but certain taxa are capable of detecting either or both the pressure and particle velocity components of a sound. An important component of hearing is the ability to detect sounds over and above the ambient background noise. Auditory masking of a sound occurs when its' received level is at a similar level to background noise within the same frequencies. The signal to noise ratio required to detect a pure tone signal in the presence of background noise is referred to as the critical ratio.

The auditory thresholds of many species are affected by the ratio of the sound stimulus duration to the total time (duty cycle) of impulsive sounds of <200 millisecond duration. The lower the duty cycle the higher the hearing threshold usually is. Although seismic sound impulses are extremely short and have a low duty cycle at the source, received levels may be longer due to the transmission and attenuation of the sound (as discussed above).

Below follows a brief review of the impacts of seismic surveys on marine faunal communities. This information is largely drawn from McCauley (1994), McCauley et al. (2000), the Generic EMPr for Oil and Gas Prospecting off the Coast of South Africa and the very comprehensive review by Cetus Projects (2007), supplemented by more recent peer-reviewed literature available on the WWW. While the discussion and assessments focus primarily on marine mammals, the effects on pelagic and benthic invertebrates, fish, turtles and seabirds are also covered briefly.

9.3.1.1.1 NOISE IMPACT ON WHALES AND DOLPHINS

The potential impact of seismic survey noise on whales and dolphins could include physiological injury to individuals, behavioural avoidance of individuals (and subsequent displacement from key habitat), masking of important environmental or biological sounds and indirect effects due to effects on predators or prey.

Physiological injury and mortality: The potential impact of seismic noise on physiological injury of mysticetes and odontocetes, considering their high sensitivity, the high probability of the impact occurring and the medium consequence, is deemed to be of MEDIUM significance pre-mitigation.

Behavioural avoidance: The potential impact of seismic noise on behavioural changes in mysticetes and odontocetes, considering their high sensitivity, the high probability of the impact occurring and the medium consequence, is deemed to be of MEDIUM significance pre-mitigation.

Masking of Sounds and Communication: The potential impact of seismic noise on the masking of environmental sounds and communications in mysticetes and odontocetes, considering their high sensitivity, the high probability of the impact occurring and the medium consequence, is deemed to be of MEDIUM significance pre-mitigation.

Indirect impacts due to effects on predators or prey: The potential indirect impact of seismic noise on food sources of mysticetes and odontocetes, considering their high sensitivity, the low likelihood of the impact occurring and the very low consequence, is thus deemed to be of VERY LOW significance pre-mitigation.

The potential impacts cannot be eliminated due to the nature of the seismic sound source required during surveying. The proposed mitigation measures, which are essentially designed to keep animals out of the immediate area of impact and thereby reduce the risk of deliberate injury to marine mammals would reduce the intensity of most impacts to medium, and the residual impacts will reduce to low consequence and LOW significance, except for the effects on prey which remains of VERY LOW significance.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Impacts of seismic noise on mysticetes and odontocetes	Operation	Medium	Low	Low
Mitigation Measures				

• Please refer to Section 11.4.1 below for detailed mitigation measures for cetaceans. Key mitigation measures include:
  • Application of the mitigation hierarchy;
  • Pre-survey planning;
  • Passive acoustic monitoring and MMOs;				

JK28

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
• Seismic source testing and pre-start protocols; and • Vessel and aircraft operations to avoid sensitive areas.				

9.3.1.1.2 NOISE IMPACT ON SEALS

The potential impact of seismic survey noise on seals could include physiological injury to individuals, behavioural avoidance of individuals (and subsequent displacement from key habitat), masking of important environmental or biological sounds and indirect effects due to effects on predators or prey. The Cape fur seal that occurs off the West Coast forages over the continental shelf to depths of over 200 m and is thus unlikely to be encountered in the Reconnaissance Permit Area (see Figure 46).

Physiological injury and mortality: The potential impact of seismic noise on physiological injury or mortality of seals, considering their low sensitivity, the very low likelihood of the impact occurring and the medium consequence, is deemed to be of LOW significance pre-mitigation.

Behavioural avoidance: The potential impact of seismic noise on behavioural changes in seals, considering their low sensitivity, the very low likelihood of the impact occurring and the very low consequence, is deemed to be of VERY LOW significance pre-mitigation.

Masking of Sounds and Communication: The potential impact of seismic noise on the masking of environmental sounds and communications in seals, considering their low sensitivity, the very low likelihood of the impact occurring and the very low consequence, is deemed to be of VERY LOW significance pre-mitigation.

Indirect impacts due to effects on predators or prey: The potential indirect impact of seismic noise on food sources of seals, considering their low sensitivity, the very low likelihood of the impact occurring and the very low consequence, is thus deemed to be of VERY LOW significance pre-mitigation.

With the implementation of the typical 'soft-start' procedures, the residual impacts of physiological injury and mortality reduce to VERY) LOW significance. All other impacts on seals would all remain NEGLIGIBLE.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Impacts of seismic noise on seals	Operation	Low	Low	Low
Mitigation Measures				
• Implement a "soft-start" procedure of a minimum of 20 minutes' duration on initiation of the seismic source during all hours it is confirmed visually by the MMO during the pre-acquisition watch (60 minutes) that there are no seals within 500 m of the seismic source. • In the case of fur seals being observed within the mitigation zone, which may occur commonly around the vessel, delay "soft-starts" for at least 10 minutes until it has been confirmed that the mitigation zone is clear of all seal activity. However, if after a period of 10 minutes seals are still observed within 500 m of the seismic sources, the normal "soft-start" procedure should be allowed to commence for at least a 20-minute duration. Seal activity should be carefully monitored during "soft-starts" to determine if they display any obvious negative responses to the seismic source and gear or if there are any signs of injury or mortality as a direct result of the seismic activities. • Terminate seismic source on observation of any obvious mortality or injuries to seals when estimated by the MMO to be as a direct result of the survey.				

9.3.1.1.3 NOISE IMPACTS ON TURTLES

The potential effects of seismic surveys on turtles include:

- Physiological injury (including disorientation) or mortality from seismic noise;
- Behavioural avoidance of seismic survey areas;
- Masking of environmental sounds and communication; and
- Indirect impacts due to effects on predators or prey.

Physiological injury and mortality: The potential impact of seismic noise on physiological injury or mortality of turtles, considering their high sensitivity and medium consequence, is deemed to be of MEDIUM significance. In the case of hatchlings and juveniles, the impact can be considered of MEDIUM significance due to their high sensitivity and the potentially high intensity of the impact pre-mitigation.

Behavioural avoidance: The potential impact of seismic noise on behavioural changes in turtles, considering their medium sensitivity, the medium probability of the impact occurring and the very low consequence, is deemed to be of VERY LOW significance pre-mitigation.

Masking of Sounds and Communication: The potential impact of seismic noise on the masking of environmental sounds and communications in turtles, considering their medium sensitivity, the medium probability of the impact occurring and the very low consequence, is deemed to be of VERY LOW significance pre-mitigation.

Indirect impacts due to effects on predators or prey: The potential indirect impact of seismic noise on food sources of turtles, considering their medium sensitivity, the very low likelihood of the impact occurring and the very low consequence, is thus deemed to be of VERY LOW significance pre-mitigation.

With the implementation of the mitigation measures above, the residual impact on potential physiological injury would reduce to LOW. The other impacts would remain of VERY LOW significance.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Impacts of seismic noise on turtles	Operation	Medium	Low	Low
Mitigation Measures				
• Implement a "soft-start" procedure of a minimum of 20 minutes' duration on initiation of the seismic source during all hours it is confirmed visually by the MMO during the pre- acquisition watch (60 minutes) that there are no turtles within 500 m of the seismic source. • In the case of turtles being observed within the mitigation zone, delay the "soft-start' until animals are outside the 500 m mitigation zone. • Terminate seismic source on: o Observation of turtles within the 500 m mitigation zone. o Observation of any obvious mortality or injuries to turtles when estimated by the MMO to be as a direct result of the survey. o For turtles, terminate source until such time as the animals are outside of the 500 m mitigation zone (seismic "pause", no soft-start required). • Avoid surveying within 100 m of critical foraging habitats (e.g. seamounts or convergence zones).				

9.3.1.1.4 NOISE IMPACTS ON SEABIRDS

Potential impacts of seismic pulses to diving birds could include physiological injury, behavioural avoidance of seismic survey areas and indirect impacts due to effects on prey. The seabird species are all highly mobile and would be expected to flee from approaching seismic noise sources at distances well beyond those that could cause physiological injury, but initiation of a sound source at full power in the immediate vicinity of diving seabirds could result in injury or mortality where feeding behaviour override a flight response to seismic survey

JH28

sounds. The potential for physiological injury or behavioural avoidance in non-diving seabird species, being above the water and thus not coming in direct contact with the seismic pulses, is considered NEGLIGIBLE and will not be discussed further here.

Physiological injury and mortality: The potential impact of seismic noise on physiological injury or mortality of pelagic seabirds, considering their medium sensitivity, the medium likelihood of the impact occurring and low consequence, is deemed to be of LOW significance pre-mitigation.

Behavioural avoidance: The potential impact of seismic noise on behavioural changes in pelagic seabirds, considering their medium sensitivity the medium likelihood of the impact occurring and very low to low consequence, is deemed to be of VERY LOW to LOW significance pre-mitigation.

Indirect impacts due to effects on predators or prey: The potential indirect impact of seismic noise on food sources for pelagic seabirds, considering their medium sensitivity, the very low likelihood of the impact occurring and the very low consequence, is thus deemed to be of VERY LOW significance pre-mitigation.

With the implementation of the mitigation measures above, the residual impact on potential physiological injury or behavioural avoidance by seabirds, masking of sounds and indirect impacts on food sources would remain VERY LOW.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Impacts of seismic noise on diving seabirds	Operation	Low	Low	Low
Mitigation Measures				
• Implement a "soft-start" procedure of a minimum of 20 minutes' duration on initiation of the seismic source during all hours it is confirmed visually by the MMO during the pre-shoot watch (60 minutes) that there are no penguins or feeding aggregations of diving seabirds within 500 m of the seismic source. • In the case of penguins or feeding aggregations of diving seabirds being observed within the mitigation zone, delay the 'soft-start' until animals are outside the 500 m mitigation zone. • Terminate seismic source on observation of penguins and feeding aggregations of diving seabirds within the 500 m mitigation zone. • For penguins and feeding aggregations of diving seabirds, terminate source until such time as the animals are outside of the 500 m mitigation zone (seismic "pause", no soft-start required).				

9.3.1.1.5 NOISE IMPACTS ON FISH

Fish hearing has been reviewed by numerous authors including Popper and Fay (1973), Hawkins (1973), Ateme *et al.* (1988), Hawkins & Popper (2018) and Slabbekoorn *et al.* (2019) (amongst others). Fish have two different systems to detect sounds namely 1) the ear (and the otolith organ of their inner ear) that is sensitive to sound pressure and 2) the lateral line organ that is sensitive to particle motion. Certain species utilise separate inner ear and lateral line mechanisms for detecting sound; each system having its own hearing threshold (Tavolga & Wodinsky 1963), and it has been suggested that fish can shift from particle velocity sensitivity to pressure sensitivity as frequency increases (Cahn *et al.* 1970, in Turl 1993). More recently, Popper & Hawkins (2018) determined that most fish (and all elasmobranchs) primarily detect particle motion.

In fish, the proximity of the swim-bladder to the inner ear is an important component in the hearing as it acts as the pressure receiver and vibrates in phase with the sound wave. Vibrations of the otoliths, however, result from both the particle velocity component of the sound as well as stimulus from the swim-bladder. The resonant frequency of the swim-bladder is important in the assessment of impacts of sounds as species with swim-bladders of a resonant frequency similar to the sound frequency would be expected to be most susceptible to injury. Although the higher frequency energy of received seismic impulses needs to be taken into consideration,

the low frequency sounds of seismic surveys would be most damaging to swim-bladders of larger fish. The lateral line is sensitive to low frequency (between 20 and 500 Hz) stimuli through the particle velocity component of sound and would thus be sensitive to the low frequencies of airguns, which most energy at 20-150 Hz.

The sound waves produced during seismic surveys are low frequency, with most energy at 20-150 Hz (although significant contributions may extend up to 500 Hz) (Hirst & Rodhouse 2000), and overlap with the range at which fish hear well (Dalen & Knutsen 2008). A review of the available literature suggests that potential impacts of seismic pulses to fish (including sharks) species could include physiological injury and mortality, behavioural avoidance of seismic survey areas, reduced reproductive success and spawning, masking of environmental sounds and communication, and indirect impacts due to effects on predators or prey (Popper & Hawkins 2018).

Physiological injury and mortality: The potential impact of seismic noise on physiological injury or mortality of fish, considering their high sensitivity and medium consequence, is thus deemed to be of MEDIUM significance pre-mitigation.

Behavioural avoidance: The potential impact of seismic noise on behavioural changes in large migratory pelagic fish, considering the high sensitivity, the low to medium likelihood of the impact occurring and medium consequence, is deemed to be of MEDIUM significance pre-mitigation.

Reproductive success / spawning: The potential impact of seismic noise on the reproductive success and spawning of nearshore commercial fish species, considering their high sensitivity, the low to medium likelihood of the impact occurring and the very low consequence, is deemed to be of LOW significance pre-mitigation.

Masking of environmental sounds and communication: The potential impact of seismic noise on the masking of sounds of fish, considering the high sensitivity, the low likelihood of the impact occurring and the very low consequence is thus deemed to be of LOW significance pre-mitigation.

Indirect impacts due to effects on predators or prey: The potential indirect impact of seismic noise on food sources for fish, considering their high sensitivity, the low likelihood of the impact occurring and the very low consequence, is thus deemed to be of LOW significance pre-mitigation.

The potential impacts cannot be eliminated due to the nature of the seismic sound source required during surveying. The location of the Application Area well to the west of the 'ring-fenced' area and proposed mitigation measures, which are essentially designed to keep animals out of the immediate area of impact and thereby reduce the risk of deliberate injury to fish, reduces the intensity of the impacts relating to physiological injury / mortality to medium, the residual impact will reduce to low consequence and be of LOW significance. All other impacts on fish remain of LOW significance.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Impacts of seismic noise to pelagic fish	Operation	Medium	Low	Low
Mitigation Measures				
• Implement a "soft-start" procedure of a minimum of 20 minutes' duration on initiation of the seismic source during hours it is confirmed visually by the MMO during the pre-shoot watch (60 minutes) that there are no shoaling large pelagic fish within 500 m of the seismic source. • Terminate seismic source on o Observation of slow swimming large pelagic fish (including whale sharks, basking sharks, manta rays) within the 500 m mitigation zone. o Observation of any obvious mass mortalities of fish (specifically large shoals of tuna or surface shoaling small pelagic species such as sardine, anchovy and mackerel) when estimated by the MMO to be as a direct result of the survey.				

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
• For slow swimming large pelagic fish, terminate source until such time as the animals are outside of the 500 m mitigation zone (seismic "pause", no soft-start required).				

9.3.1.1.6 NOISE IMPACTS ON MARINE INVERTEBRATES

Many marine invertebrates have tactile organs or hairs (termed mechanoreceptors), which are sensitive to hydro-acoustic near-field disturbances, and some have highly sophisticated statocysts, which have some resemblance to the ears of fishes (Offutt 1970; Hawkins & Myrberg 1983; Budelmann 1988, 1992; Packard *et al.* 1990; Popper *et al.* 2001) and are thought to be sensitive to the particle acceleration component of a sound wave in the far-field. Potential impacts of seismic pulses on invertebrates would include physiological injury or mortality in the immediate vicinity of the airgun sound source, and behavioural avoidance. Masking of environmental sounds and indirect impacts due to effects on predators or prey have not been documented and are highly unlikely and are thus not discussed further here.

The potential impact of 3D seismic noise on benthic, and neritic and pelagic invertebrates, considering the low sensitivity, the low likelihood of the impact occurring is thus deemed to be of NEGLIGIBLE significance pre-mitigation.

With the implementation of the typical 'soft-starts', the residual impact on potential behavioural avoidance by cephalopods would remain of NEGLIGIBLE significance.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Impacts of seismic noise to marine invertebrates	Operation	Low	Low	Low
Mitigation Measures				
• Terminate seismic source on observation of any obvious mass mortalities of squid when estimated by the MMO to be as a direct result of the survey.				

9.3.1.1.7 NOISE IMPACT ON PLANKTON

As the movement of phytoplankton, zooplankton and ichthyoplankton is largely limited by currents, they are not able to actively avoid the seismic vessel and thus are likely to come into close contact with the sound sources, potentially experiencing multiple exposures during acquisition of adjacent lines. Potential impacts of seismic pulses on plankton would include physiological injury or mortality in the immediate vicinity of the airgun sound source.

The potential impact of seismic noise on phytoplankton and zooplankton, considering the medium sensitivity and very low consequence, is thus deemed to be of VERY LOW significance both with and without mitigation. Due to the medium consequence and medium sensitivity of ichthyoplankton, but the low likelihood of the impact occurring in offshore waters, the impacts are deemed to be of MEDIUM significance pre-mitigation.

This potential impact cannot be eliminated due to the nature of the seismic sound source required during surveying. With the implementation of the below mitigation measure, the residual impact would reduce to VERY LOW significance.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Noise impact on Plankton	Operation	Medium	Low	Low

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Mitigation Measures				
• As the Application Area is located far offshore, it is not deemed necessary to implement mitigation measures to avoid the key spring spawning periods thereby mitigating potential impacts on plankton to some degree. In addition, TGS has agreed to avoid the key "ring fenced" fishing and spawning areas in the south-east of the reconnaissance permit area identified during previous consultation with the commercial fishing sector. No other direct mitigation measures for potential impacts on plankton and fish egg and larval stages are feasible or deemed necessary.				

9.3.1.2 OTHER IMPACTS OF SEISMIC SURVEYS ON MARINE FAUNA

9.3.1.2.1 IMPACTS OF NON-SEISMIC NOISE (VESSEL AND HELICOPTER NOISE)

Elevated underwater and aerial noise can affect marine fauna, including cetaceans, by:

- causing direct physical injury to hearing;
- masking or interfering with other biologically important sounds (e.g. communication, echolocation, signals and sounds produced by predators or prey);
- causing disturbance to the receptor resulting in behavioural changes or displacement from important feeding or breeding areas.

Vessel Noise: The potential impact of vessel noise causing physiological injury to, or behavioural avoidance by, pelagic and coastal sensitive species, is deemed to be of VERY LOW significance pre-mitigation.

Aircraft Noise: The potential impact of aircraft noise causing physiological injury to, or behavioural avoidance by, pelagic and coastal sensitive species, is deemed to be of LOW significance pre-mitigation.

The generation of noise from helicopters cannot be eliminated if helicopters are required for crew changes. Similarly, the generation of vessel noise cannot be eliminated. The proposed mitigation, specifically maintaining the regulated altitude over the coastal zone and MPAs and flying perpendicular to the coast would reduce the intensity of the impact to very low, but the residual impact will remain of very low consequence and of LOW significance. Without mitigation measures for vessel noise, the residual impact of vessel noise would remain VERY LOW.

Aircraft and vessel noise would, however, likely contribute to the growing suite of cumulative acoustic impacts to marine fauna in the area, but assessing the population level consequences of multiple smaller and more localised stressors (see for example Booth *et al.* 2020; Derous *et al.* 2020) is difficult.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Impacts of vessel noise on marine fauna	Operation	Low	Low	Low
Impacts of support aircraft noise on marine fauna	Operation	Low	Low	Low
Mitigation Measures				
• Pre-plan flight paths to ensure that no flying occurs over coastal seal colonies and seabird nesting areas. • Avoid extensive low-altitude coastal flights by ensuring that the flight path is perpendicular to the coast, as far as possible.				

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
• Brief all pilots on the ecological risks associated with flying at a low level along the coast or above marine mammals.				

9.3.1.2.2 IMPACT OF VESSEL LIGHTING ON PELAGIC FAUNA

The survey activities would be undertaken in the offshore marine environment, more than 100 km offshore, far removed from any sensitive coastal receptors (e.g. bird or seal colonies), but could still directly affect migratory pelagic species (pelagic seabirds, turtles, marine mammals and fish) transiting through the Reconnaissance Permit Area. The strong operational lighting used to illuminate the survey vessel at night may disturb and disorientate pelagic seabirds feeding in the area. Operational lights may also result in physiological and behavioural effects of fish and cephalopods as these may be drawn to the lights at night where they may be more easily preyed upon by other fish and seabirds.

The potential for collision of birds with the survey vessel due to lighting or behavioural disturbance by vessel lighting is deemed to be of VERY LOW significance pre-mitigation, due to the medium sensitivity of the receptors, the low likelihood of the impact occurring and the very low consequence.

With the implementation of the mitigation measures above, the residual impact would remain VERY LOW.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Impact of vessel lighting	Operation	Low	Low	Low
Mitigation Measures				
• The lighting on the survey and support vessels should be reduced to a minimum compatible with safe operations whenever and wherever possible. Light sources should, if possible and consistent with safe working practices, be positioned in places where emissions to the surrounding environment can be minimised. • Keep disorientated, but otherwise unharmed, seabirds in dark containers for subsequent release during daylight hours. Ringed/banded birds should be reported to the appropriate ringing/banding scheme (details are provided on the ring).				

9.3.1.2.3 BALLAST WATER DISCHARGES AND HULL FOULING

Artificial structures deployed at sea serve as a substrate for a wide variety of larvae, cysts, eggs and adult marine organisms. The transportation of equipment from one part of the ocean to another would therefore also facilitate the transfer of the associated marine organisms. Survey vessels, seismic equipment and support vessels are used and relocated all around the world. Similarly, the ballasting and de-ballasting of these vessels may lead to the introduction of exotic species and harmful aquatic pathogens to the marine ecosystems (Bax *et al.* 2003).

The marine invertebrates that colonize the surface of vessels can easily be introduced to a new region, where they may become invasive by outcompeting and displacing native species. Marine invasive species are considered primary drivers of ecological change in that they create and modify habitat, consume and outcompete native fauna, act as disease agents or vectors, and threaten biodiversity. Once established, an invasive species is likely to remain in perpetuity (Bax *et al.* 2003).

The potential for introductions of non-native marine species through hull fouling or ballast water discharge is deemed to be VERY LOW pre-mitigation, due to the very low sensitivity of the offshore receptors, the low likelihood of the impact occurring and the low consequence.

With the implementation of the mitigation measures above, the residual impact would reduce to NEGLIGIBLE.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Ballast water discharges	Operation	Low	Low	Low
Mitigation Measures				
• Avoid the unnecessary discharge of ballast water. • Use filtration procedures during loading in order to avoid the uptake of potentially harmful aquatic organisms, pathogens and sediment that may contain such organisms. • Ensure that routine cleaning of ballast tanks to remove sediments is carried out, where practicable, in mid-ocean or under controlled arrangements in port or dry dock, in accordance with the provisions of the ship's Ballast Water Management Plan. • Ensure all infrastructure (e.g. arrays, streamers, tail buoys etc) that has been used in other regions is thoroughly cleaned prior to deployment.				

9.3.1.2.4 ROUTINE VESSEL DISCHARGES

The discharge of wastes to sea could create local reductions in water quality, both during transit to and within the Application Area. Deck and machinery space drainage may result in small volumes of oils, detergents, lubricants and grease, the toxicity of which varies depending on their composition, being introduced into the marine environment. Sewage and galley waste will place a small organic and bacterial loading on the marine environment, resulting in an increased biological oxygen demand.

These discharges will result in a local reduction in water quality, which could impact marine fauna in a number of different ways:

- Physiological effects: Ingestion of hydrocarbons, detergents and other waste could have adverse effects on marine fauna, which could ultimately result in mortality.
- Increased food source: The discharge of galley waste and sewage will result in an additional food source for opportunistic feeders, speciality pelagic fish species.
- Increased predator - prey interactions: Predatory species, such as sharks and pelagic seabirds, may be attracted to the aggregation of pelagic fish attracted by the increased food source.

The impacts associated with normal waste discharges from the survey vessel is deemed to be of VERY LOW significance pre-mitigation, due to the medium sensitivity of the offshore receptors, the medium probability of the impact occurring and the very low consequence.

This potential impact cannot be eliminated because the seismic / support vessels are needed to undertake the survey and will generate routine discharges during operations. With the implementation of the project controls and mitigation measures, the residual impact will remain of VERY LOW significance.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Routine vessel discharges	Operation	Low	Low	Low
Mitigation Measures				
• Implement leak detection and repair programmes for valves, flanges, fittings, seals, etc. • Use a low-toxicity biodegradable detergent for the cleaning of all deck spillages.				

5008

9.3.1.3 UNPLANNED EVENTS

9.3.1.3.1 VESSEL STRIKES AND ENTANGLEMENT

The potential affects of vessel presence and towed equipment on turtles and cetaceans include physiological injury or mortality.

The potential for collision with or entanglement by turtles and cetaceans during the seismic survey or the transit of the vessel to or from the Application Area is deemed to be of LOW significance pre-mitigation, due to the high sensitivity of the receptors, but very low likelihood of the impact occurring and the low consequence.

With the implementation of the mitigation measures above, the residual impact would remain LOW.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Vessel strikes and entanglement	Operation	Low	Low	Low
Mitigation Measures				
• The vessel operators should keep a constant watch for marine mammals and turtles in the path of the vessel. • Keep watch for marine mammals behind the vessel when tension is lost on the towed equipment and either retrieve or regain tension on towed gear as rapidly as possible. • Ensure that 'turtle-friendly' tail buoys are used by the survey contractor or that existing tail buoys are fitted with either exclusion or deflector 'turtle guards'. • Ensure vessel transit speed between the Application Area and port is a maximum of 12 knots (22 km/hr), except in MPAs where it is reduced further to 10 knots (18 km/hr) as well as when they are present in the vicinity.				

9.3.1.3.2 LOSS OF EQUIPMENT

The potential impacts associated with lost equipment include:

- Potential disturbance and damage to seabed habitats and crushing of epifauna and infauna within the equipment footprint; and
- Potential physiological injury or mortality to pelagic and neritic marine fauna due to entanglement in streamers, arrays and tail buoys drifting on the surface or in the water column.

The impacts associated with the accidental loss of equipment are deemed to be of VERY LOW significance pre-mitigation, due to the medium sensitivity of the offshore receptors, the very low likelihood of the impact occurring and the very low consequence.

With the implementation of the project controls and mitigation measures, the residual impact will remain of VERY LOW significance

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Release of diesel	Operation	Low	Low	Low
Mitigation Measures				
• Ensuring that loads are lifted using the correct lifting procedure and within the maximum lifting capacity of crane system. • Minimise the lifting path between vessels.				

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
• Undertake frequent checks to ensure items and equipment are stored and secured safely on board each vessel. • In the event that equipment is lost during the operational stage, assess safety and metocean conditions before performing any retrieval operations. Establishing a hazards database listing the type of gear left on the seabed and/or in the Reconnaissance Permit area with the dates of abandonment/loss and locations, and where applicable, the dates of retrieval				

9.3.1.3.3 RELEASE OF DIESEL

Marine diesel spilled in the marine environment would have an immediate detrimental effect on water quality, with the toxic effects potentially resulting in mortality (e.g. suffocation and poisoning) of marine fauna or affecting faunal health (e.g. respiratory damage). If the spill reaches the coast, it can result in the smothering of sensitive coastal habitats.

The impact methodology used to assess the impact significance calculates an overall LOW pre-mitigation significance. However, considering the high sensitivity of receptors and the very low (offshore) and medium consequence (nearshore), the potential impact on the marine fauna is in reality considered to range from LOW significance (offshore) to MEDIUM significance (nearshore) without mitigation. The likelihood of the impact occurring is, however, low.

With the implementation of the project controls and mitigation measures, the residual impact will reduce to LOW significance for nearshore spills, and remain LOW for offshore spills.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Release of diesel	Operation	Medium	Low	Low
Mitigation Measures				
• Use low toxicity dispersants cautiously and only with the permission of DFFE. • As far as possible, and whenever the sea state permits, attempt to control and contain the spill at sea with suitable recovery techniques to reduce the spatial and temporal impact of the spill • Ensure adequate resources are provided to collect and transport oiled birds to a cleaning station. • Ensure offshore bunkering is not undertaken in the following circumstances: o Wind force and sea state conditions of ≥6 on the Beaufort Wind Scale; o During any workboat or mobilisation boat operations; o During helicopter operations; o During the transfer of in-sea equipment; and o At night or times of low visibility.				

9.3.1.4 CONFOUNDING EFFECTS AND CUMULATIVE IMPACTS

The assessments of impacts of seismic sounds provided in the scientific literature usually consider short-term responses at the level of individual animals only, as our understanding of how such short-term effects relate to adverse residual effects at the population level are limited. Data on behavioural reactions to seismic noise acquired over the short-term could, however, easily be misinterpreted as being less significant than the cumulative effects over the long-term, i.e. what is initially interpreted as an impact not having a detrimental effect and thus being of low significance, may turn out to result in a long-term decline in the population.

particularly when combined with other stressors (e.g. temperature, competition for food, shipping noise). Confounding effects are, however, difficult to separate from those due to seismic surveys.

Similarly, potential cumulative impacts on individuals and populations as a result of other seismic surveys undertaken either previously, concurrently or subsequently are difficult to assess. A significant adverse residual environmental effect is considered one that affects marine biota by causing a decline in abundance or change in distribution of a population(s) over more than one generation within an area. Natural recruitment may not re-establish the population(s) to its original level within several generations or avoidance of the area becomes permanent. Historic survey data for the West Coast is illustrated in Figure 115, which shows the 2D survey lines acquired between 2001 and 2018 and indicates 3D survey areas on the West Coast. Despite the density of seismic survey coverage over the past 17 years, the southern right whale population is reported to be increasing by 6.5% per year, and the humpback whale by at least 5% per annum over a time when seismic surveying frequency has increased, suggesting that, for these populations at least, there is no evidence of long-term negative change to population size as a direct result of seismic survey activities.

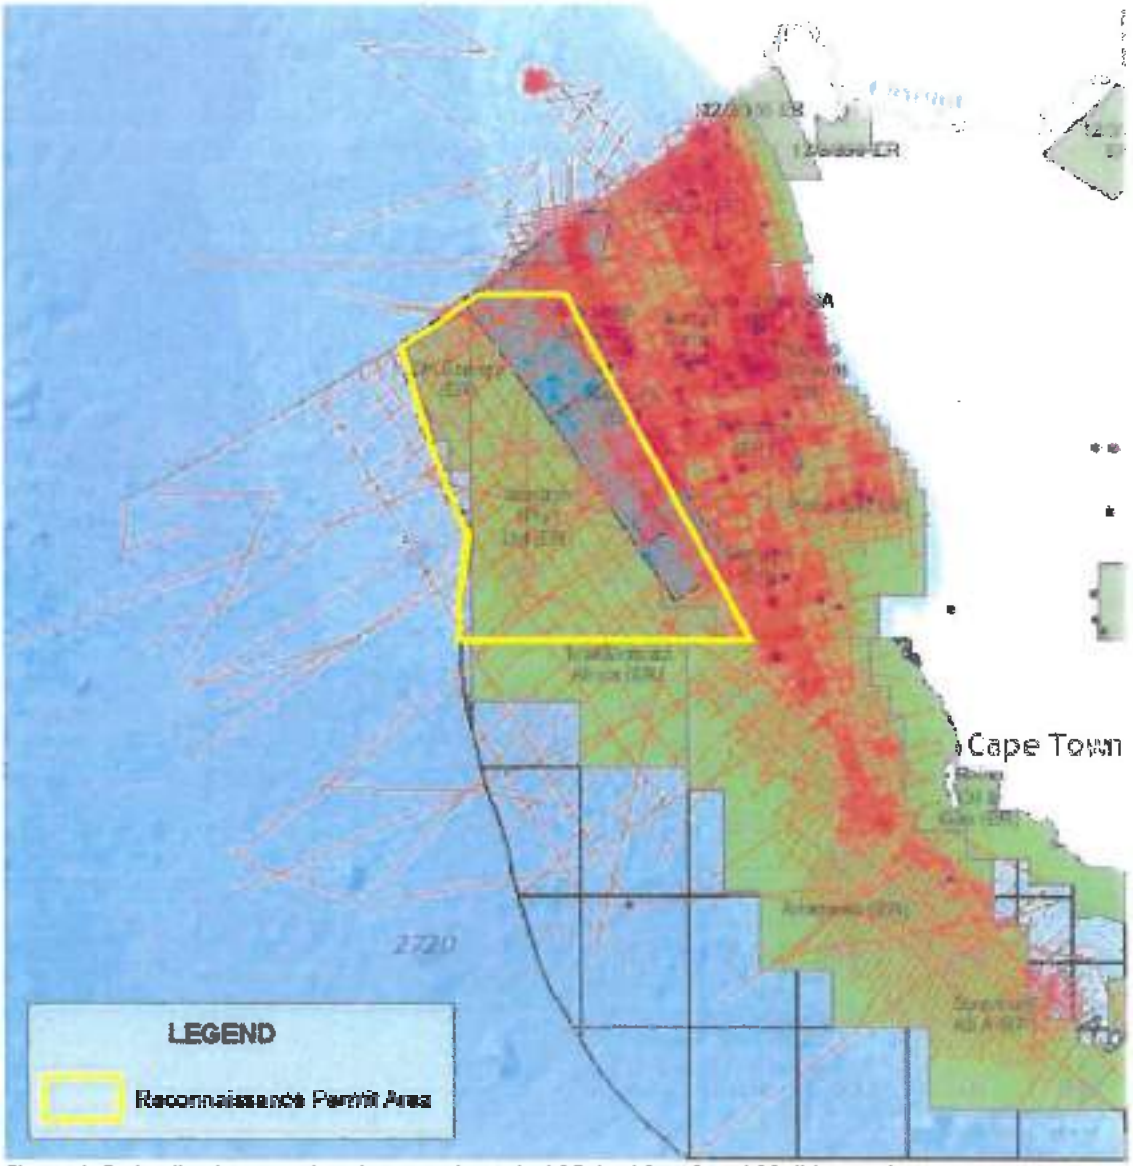


Figure 115: Application Area in relation to historical 2D (red lines) and 3D (blue and purple polygons) surveys conducted on the West Coast between 2001 and 2018 (Source: PASA).

Reactions to sound by marine fauna depend on a multitude of factors including species, state of maturity, experience, current activity, reproductive state, time of day. If a marine animal does react briefly to an

underwater sound by changing its behaviour or moving a small distance, the impacts of the change are unlikely to be significant to the individual, let alone the population as a whole. However, if a sound source displaces a species from an important feeding or breeding area for a prolonged period, impacts at the population level could be significant. The increasing numbers of southern right and humpback whales around the Southern African coast, and their lingering on West Coast feeding grounds long into the summer, suggest that those surveys conducted over the past 17 years have not negatively influenced the distribution patterns of these two migratory species at least. Information on the population trends of resident species of baleen and toothed whales is unfortunately lacking, and the potential effects of seismic surveys on such populations remains unknown

Consequently, suitable mitigation measures must be implemented during seismic data acquisition to ensure the least possible disturbance of marine fauna in an environment where the cumulative impact of increased background anthropogenic noise levels has been recognised as an ongoing and widespread issue of concern. Should other concurrent seismic survey activities be undertaken in the Orange Basin, cumulative impacts can be expected.

Despite the difficulty in undertaking a reliable assessment of the potential cumulative environmental impacts of future seismic acquisition in the Deep Water Orange Basin due to likely variation in the scope, extent and duration of proposed surveys, the cumulative impacts of three potential surveys occurring concurrently needs to be considered.

The cumulative assessment table below assumes the worst case scenario of three surveys (Searcher, TGS and GX Technologies) occurring simultaneously during the summer survey window in 2022/23. In the unlikely event that multiple surveys would be undertaken concurrently within the Deep Water Orange Basin Area, associated impacts to marine fauna would be of high intensity and extend regionally, over the short-term (assuming they take place over the same summer survey window). The impact consequence for cumulative surveys is therefore considered medium.

The impacts to marine fauna associated with concurrent surveys are deemed to be of MEDIUM significance, due to the high sensitivity of the offshore receptors, the very high likelihood of cumulative effects of acoustic impacts on marine fauna.

With the implementation of the above-mentioned controls and mitigation measures, the intensity of the impact would reduce to MEDIUM and the probability of the impact would reduce to UNLIKELY, but the overall significance would remain MEDIUM.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Impacts to marine fauna of concurrent seismic acquisition by multiple operators	Operation	Medium	Medium	Medium
Mitigation Measures				
• Should surveys be run simultaneously, ensure that a distance of at least 40 km is maintained between survey vessels[23] until sufficient objective evidence is obtained that a reduced buffer distance is acceptable.				

[23] This 40 km buffer maintained by any other survey vessels aligns to advice by the US Department of Interior (2014) and is considered sufficient on the basis that it provides a corridor between vessels where seismic source noise approaches ambient levels such that animals may pass between, and/or the potential cumulative effect beyond this distance is considered to be negligible.

9.3.2 IMPACTS ON FISHERIES

This section provides a description of the Fisheries impacts identified by in the Fisheries Study and Sound Transmission Loss Modelling Study. For a more detailed description of the impacts, please refer to the Fisheries Study and Sound Transmission Loss Modelling Study included in Appendix 3.

9.3.2.1 EXCLUSION FROM FISHING GROUND DUE TO TEMPORARY SAFETY ZONE AROUND SURVEY VESSEL

A purpose-built seismic vessel would be contracted to conduct the 3D seismic survey. The acoustic source would consist of up to 20 active airguns with an overall operating pressure of 2 000 pound-force per square inch (psi). The acoustic source would be situated approximately 50 m behind the seismic vessel at 7 m to 8 m below the water surface. The receiver array for the 3D survey would consist of up to 10 streamer cables, 8 km in length, towed in parallel with a separation of 150 m. The streamer cables would be towed at a depth of between 6 m and 10 m and would therefore not be visible to other vessels. A tailbuoy would mark the far end of each of the streamer cables and would be marked by AIS.

Figure 126: Schematic diagram showing side-view of the airgun array and hydrophone cable ("streamer") towed in a 2D seismic survey.

The acquisition of high quality seismic data requires that the position of the survey vessel and the array be accurately known. Seismic surveys consequently require accurate navigation of the sound source over pre-determined survey transects. This, and the fact that the airgun array and the hydrophone streamer need to be towed in a set configuration behind the tow-ship, means that the survey operation has little manoeuvrability whilst operating. For this reason, the vessel is considered as a fixed marine feature that is to be avoided by other vessels.

The safety zones aim to ensure the safety of navigation, avoiding or reducing the probability of damage to the towed streamer cables. The temporary exclusion of vessels from entering the safety zone around a seismic survey vessel poses a direct impact to fishing operations in the form of loss of exclusion from fishing grounds.

Based on the location of the Reconnaissance Permit application area, there is no impact of exclusion from fishing grounds expected on the demersal trawl, midwater trawl, demersal longline, small pelagic purse-seine, linefish, west coast rock lobster or small-scale fisheries. There is a high probability that the large pelagic longline sector (targeting tuna, swordfish and shark) will experience loss of access to fishing ground over the duration of the proposed 70 day survey. Although the Reconnaissance Permit area is situated offshore of the continental shelf break, this being an area of peak fishing activity, there is a high probability that vessels and drifting lines could be expected within the Reconnaissance Permit area. The extent of the impact is considered to be regional due to the large area (57 400 km²) within which the survey could take place[24]. The impact of exclusion is assessed to be of high magnitude[25]. Based on the combination of extent, duration and magnitude of the impact, and considering the high probability that the impact would occur, the overall significance of the impact is considered to be MEDIUM NEGATIVE. Due to the low probability of the operations of the tuna pole-line sector within the Reconnaissance Permit area, the overall significance of the impact on the sector is considered to be LOW NEGATIVE.

This potential impact cannot be eliminated because the seismic vessels are needed to undertake the survey and a safety zone will be enforced around the vessel during routine operations. Timing the survey to avoid taking

[24] Also noting that during a 3D seismic survey the vessel would acquire the data progressively across the designated area i.e. the area of exclusion area is localised at any one point in time. However, the impact rating has been assessed based on the cumulative impact of exclusion across the full extent of the Reconnaissance Permit area.

[25] Where fishing operations in the affected area could temporarily cease

place during the months of June and July (periods of seasonally high fishing effort) could lead to a residual impact of LOW NEGATIVE significance on the large pelagic longline sector.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Fisheries Exclusion: Large Pelagic Longline	Operation	**Medium**	Low	Low
Fisheries Exclusion: Tuna Pole-line	Operation	Low	Low	Low

Mitigation Measures

- Timing of the seismic survey to avoid periods of peak fishing activity during June and July is recommended in order to reduce the probability of disruption to the large pelagic longline fishing sector.
- At least three weeks prior to the commencement of seismic survey activities the following key stakeholders should be consulted and informed of the proposed seismic survey programme (including navigational co-ordinates of location, timing and duration of proposed activities) and the likely implications thereof (specifically the exclusion and safety zone around the seismic vessel):
    - Fishing industry associations: SA Tuna Association; SA Tuna Longline Association, Fresh Tuna Exporters Association, South African Deepsea Trawling Industry Association (SADSTIA), South African Hake Longline Association (SAHLLA).
    - Other key stakeholders: South African Navy Hydrographic Office (SANHO), South African Maritime Safety Association, Ports Authority and the DFFE Vessel Monitoring, Control and Surveillance Unit in Cape Town.
    - These stakeholders should again be notified at the completion of the project when the survey and support vessels are off location.
- Request, in writing, the SANHO to broadcast a navigational warning via Navigational Telex (Navtex) and Cape Town radio for the duration of the seismic survey activity.
- Distribute a Notice to Mariners prior to the commencement of the seismic survey operations. The Notice to Mariners should give notice of (1) the co-ordinates of the survey area, (2) an indication of the proposed survey timeframes, (3) the dimensions of the towed gear array and dimensions of the safety zone around the seismic vessel, and (4) provide details on the movements of support vessels servicing the project. This Notice to Mariners should be distributed timeously to fishing companies and directly onto vessels where possible.
- An experienced Fisheries Liaison Officer (FLO) should be placed on board the seismic or escort vessel to facilitate communications with fishing vessels in the vicinity of the seismic survey area.
- The lighting on the seismic and support vessels should be managed to ensure that they are sufficiently illuminated to be visible to fishing vessels, as well as ensure that it is reduced to a minimum compatible with safe operations.
- Ensure project vessels fly standard flags and lights to indicate that they are engaged in towing surveys and are restricted in manoeuvrability.
- Notify any fishing vessels at a radar range of 12 nm from the seismic vessel via radio regarding the safety requirements around the seismic vessel.
- Implement a grievance mechanism in case of disruption to fishing or navigation.

9.3.2.2 IMPACT OF SOUND ON CATCH RATES

In addition to the potential impacts of exclusion to fishing areas, international research has shown that the noise energy generated during seismic surveys may cause mortality, physiological damage, masking effects and/or behavioural responses in fish and invertebrates (Caroll *et al* 2017). As such, the possible effects of seismic sound on species relevant South African fisheries are considered. Differences in morphology and behaviour between species means that species vary in their vulnerability to seismic noise, and generalisations across groups are not easily made. The potential impact of elevated underwater sound on fish can be grouped into four types of effects:

- **Mortality or lethal effects:** life-threatening physical injuries, including death and severe physical injury. Fish mortality is associated with very high source noise levels and fish in close proximity to the noise source (for example, underwater explosions). Susceptibility to mortality at a particular sound level can vary between fish species, for example shellfish and fish without swim bladders can typically survive higher noise levels.
- **Physical (or physiological) effects:** non-life-threatening physical injuries, such as temporary or permanent auditory damage. The type and severity of physiological effects at different noise levels can differ between species. Some fish detect and respond to sound predominantly by detecting particle motion in the surrounding fluid while others are capable of detecting sound pressure via the gas bladder.
- **Masking effects:** the reduction in the detectability of a sound as a result of the simultaneous occurrence of another noise. Masking noise interferes with the ability of the animal to detect and respond to biologically important sounds.
- **Behavioural effects:** include perceptual, stress and indirect effects, of which the most common are startle responses or avoidance of an area. Behavioural responses can vary between species and sometimes extend over large distances, until the noise decreases below the background sound level.

Summarised below are some of the main findings relevant to the assessment of effects on fisheries:

- Generally, fish species with specialisations for sound pressure detection (e.g. swim bladder) have lower sound pressure thresholds and respond at higher frequencies than fishes lacking these morphological adaptations.
- Evidence suggests that pelagic species have more sensitive hearing (thresholds at lower frequencies) than demersal species.
- Cartilaginous fishes (e.g. sharks) have the highest sensitivity to low frequency sound (~20 Hz to ~1500 Hz) (Myrberg, 2001). Since this group lacks a swim bladder, their detection capabilities are restricted to the particle motion component of sound (Myrberg, 2001; Casper *et al*., 2012).
- A range of damaging physical effects due to airgun noise have been described for fish, including swim-bladder damage, transient stunning, short-term stress responses, temporary hearing loss, haemorrhaging, eye damage and blindness. However, studies have shown that physical damage to fish caused from seismic sources occurs only in the immediate vicinity of the airguns, in distances of less than a few meters (Gausland 2003).
- Adult and juvenile fish have been shown to display several behavioural responses to seismic sound. These include leaving the area of the sound source by swimming away and changing depth distribution, changing schooling behaviour and startle responses to short range start up. Behavioural responses to seismic sound could lead to decreased catch rates if fish move out of important fishing grounds (Hirst and Rodhouse 2000).
- Studies indicate that offshore seismic survey activity had no effect on catch rates of crustaceans in the surrounding area (Andriguetto-Filho *et al*. 2005; Parry & Gason 2006), and little effect on reef invertebrates (crustaceans, echinoderms and molluscs) exposed to commercial seismic airgun noise (Wardle *et al*. 2001).

57.28

- The abundance and spatial distribution of fish and invertebrate larvae and eggs is highly variable and dependent on factors such as fecundity, seasonality in production, tolerances to temperature, length of time spent in the water column, hydrodynamic processes and natural mortality. Due to their importance in commercial fisheries, numerous studies have been undertaken experimentally exposing the eggs and larvae of various species to airgun sources (reviewed in McCauley, 1994). Physiological effects on eggs and larvae of a seismic array have been demonstrated to a distance of 5 m from the acoustic source (Kostyuchenko 1971). When compared with total population sizes and natural daily mortality rates, the impact of seismic sound sources on fish eggs and larvae could be considered insignificant (McCauley, 1994; Dalen and Naested 2006). The wash from ships propellers and bow waves can be expected to have a similar, if not greater, volumetric effect on plankton than the sounds generated by airgun arrays.
- For squid and other cephalopods a 2 - 5 km zone of acoustic influence is assumed around the acoustic source point.

The zones of impact on fish of impulsive signal emissions from the array source are presented in Table 43. The results relate only to physiological effects on fish. The zones of potential injuries were predicted to be within 160 m from the 3D array for fish species with a swim bladder and 80 m for fish species without a swim bladder. The zone of potential impact was predicted to be within 160 m for fish eggs and larvae.

Based on the noise exposure criteria provided by Popper *et al.* (2014) for fish that use a swim bladder for hearing, relatively high behavioural risks are expected at near to intermediate distances (tens to hundreds of meters) from the source location. Relatively moderate behavioural risks are expected for at far field distances (thousands of meters) from the source location.

The cumulative sound fields based on one assumed 24-hour survey operation were modelled and the zones of cumulative impact (i.e. the maximum horizontal perpendicular distances from assessed survey lines to cumulative impact threshold levels) are presented in Table 44. The zones of potential mortal injuries for fish species with and without a swim bladder, and for fish eggs and larvae are predicted to be within 60 m from the survey lines. For recoverable injury, the zones of impact are predicted to be within 20 m from the survey lines for fish without a swim bladder, and within 200 m for fish with a swim bladder. The zones of TTS effect for fish species with and without swim bladders are predicted to be within 3.5 km from the survey lines for the 3D survey 24-hour operation scenarios considered.

Existing experimental data regarding recoverable injury for fish eggs and larvae is sparse and no guideline recommendations have been provided. However, based on a subjective approach, noise impacts for fish eggs and larvae are expected to be moderate at the near field (i.e. in the distance of tens of meters) from the source location, low at intermediate (i.e. in the distance of hundreds of meters) and far field (i.e. in the distance of thousands of meters) from the source location.

Table 43: Zones of immediate impact from single pulses (2D / 3D seismic airgun arrays) for mortality and recoverable injury for fish, fish eggs and fish larvae (SLR, 2022).

Type of animal	Zones of impact – maximum horizontal distances from source to impact threshold levels			
	Mortality and potential mortal injury		Recovery injury	
	Criteria - Pk SPL dB re 1µPa	Maximum threshold distance, m	Criteria - Pk SPL dB re 1µPa	Maximum threshold distance, m
Fish: no swim bladder (particle motion detection)	>213	70 / 80	>213	70 / 80
Fish: swim bladder is not involved in hearing (particle motion detection)	>207	140 / 160	>207	140 / 160

Type of animal	Zones of impact – maximum horizontal distances from source to impact threshold levels			
	Mortality and potential mortal injury		Recovery injury	
	Criteria - Pk SPL dB re 1µPa	Maximum threshold distance, m	Criteria - Pk SPL dB re 1µPa	Maximum threshold distance, m
Fish: swim bladder involved in hearing (primarily pressure detection)	>207	140 / 160	>207	140 / 160
Fish eggs and fish larvae	>207	140 / 160	-	-

Table 44: Zones of cumulative impact from multiple pulses (2D / 3D seismic airgun arrays) for mortality and recoverable injury for fish, fish eggs and fish larvae (SLR, 2022).

Type of animal	Zones of impact – maximum horizontal/perpendicular distances from assessed survey lines to cumulative impact threshold levels (2D / 3D)					
	Mortality and potential mortal injury		Recoverable injury		TTS	
	Criteria - SEL_{24h} dB re 1 µPa²·s	Maximum threshold distance, m	Criteria - SEL_{24h} dB re 1 µPa²·s	Maximum threshold distance, m	Criteria - SEL_{24h} dB re 1 µPa²·s	Maximum threshold distance, m
Fish: no swim bladder (particle motion detection)	219	< 10	216	15 / 20	186	~2 000 / 3 500
Fish: swim bladder is not involved in hearing (particle motion detection)	210	20 / 30	203	80 / 200	186	2 000 / 3 500
Fish: swim bladder involved in hearing (primarily pressure detection)	207	40 / 60	203	80 / 200	186	2 000 / 3 500
Fish eggs and fish larvae	210	20 / 50	-	-	-	-

Pulfrich (2022) concluded that the impact of the acoustic source on fish eggs and larvae accounts for an insignificant amount of mortality compared to the natural mortality rate per day for most fish species at that life stage. The Reconnaissance Permit area does not coincide with spawning areas of key commercial fish species.

The overall effects on the fishing industry of physiological injury to fish as a result of the proposed surveys is considered to be of overall LOW NEGATIVE significance (with mitigation) on the large pelagic longline sector, the only sector that operates within the Reconnaissance Permit application area.

The zones of impact of pulsed sounds on behavioural responses of fish were not modelled in the STLM because of the variability in published findings on the topic. However, if a precautionary approach is adopted, a sound range of 161 to 166 dB re 1 µPa RMS may be used as an indicator of the sound pressure level at which behavioural modifications of fish start to take place. The STLM results predict a RMS SPL of 162 dB re 1µPa at a horizontal distance of 4 km from the airgun array (SLR 2021). For the purposes of this assessment, we have assumed that the catch rates to a distance of 4 km from the Reconnaissance Permit area could be affected.

Based on the location of the Reconnaissance Permit area, the noise generated during the survey would be expected to the large pelagic longline and tuna pole-line sectors. Because the sector operates across the extent of the Reconnaissance Permit area, the affected area is considered to be of regional extent. Behavioural effects are generally immediate, with duration of the effect being less than or equal to the duration of exposure.

The noise generated during the survey would be expected to attenuate to below threshold levels for behavioural disturbance before reaching the fishing grounds of all other sectors viz. demersal trawl, midwater trawl, demersal longline, small pelagic purse-seine, traditional linefish, west coast rock lobster, small-scale fisheries and net fisheries. The Reconnaissance Permit area does not overlap with spawning areas of key commercial species (and the timing of the proposed survey is not expected to coincide with peak spawning periods).

Noise would be expected to attenuate to below threshold levels for behavioural disturbance before reaching inshore recruitment and/or nursery areas. Due to the location of the Reconnaissance Permit area in the deepwater environment, sound generated during the survey is not expected to influence the spawning behaviour or migration route of snoek (a species of key importance to the linefish and small-scale fisheries sectors). The Reconnaissance Permit area is situated well offshore of the shelf break which is where snoek are known to spawn during winter-spring.

The impact of sound on the large pelagic longline sector is assessed to be of overall MEDIUM NEGATIVE significance before mitigation, whereas the impact on the tuna pole-line sector is assessed to be of overall LOW NEGATIVE significance. Due to the distance of the Reconnaissance Permit area from fishing grounds, the sound is likely to attenuate to below threshold levels for behavioural disturbance of all other fisheries sectors viz. the demersal trawl, midwater trawl, demersal longline, small pelagic purse-seine, traditional linefish, west coast rock lobster, small-scale fisheries and netfish sectors. There is no impact expected on these sectors.

With the implementation of recommended mitigation measures, the residual impact of sound generated during the proposed survey is assessed to be of LOW NEGATIVE overall significance to the large pelagic longline and tuna pole-line sectors. There is no impact expected on the demersal trawl, midwater trawl, demersal longline, small pelagic purse-seine, traditional linefish, west coast rock lobster, small-scale and netfish sectors.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Impact of Seismic Source Sound on Fishing Operations: Large Pelagic Longline Sector	Operation	Medium	Low	Low
Impact of Seismic Source Sound on Fishing Operations: Tuna Pole-line Sector	Operation	Low	Low	Low
Mitigation Measures				
• The seismic survey should avoid taking place during periods of peak fishing activity (June and July) in order to reduce the probability of disruption to the large pelagic longline fishing sector. • At least three weeks prior to the commencement of seismic survey activities the following key stakeholders should be consulted and informed of the proposed seismic survey programme (including navigational co-ordinates of location, timing and duration of proposed activities) and the likely implications thereof (specifically the exclusion and safety zone around the seismic vessel): o Fishing industry associations: SA Tuna Association; SA Tuna Longline Association and Fresh Tuna Exporters Association. o Other key stakeholders: SANHO, SAMSA, National Ports Authority and the DFFE Vessel Monitoring, Control and Surveillance Unit in Cape Town.				

FCS

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance

- These stakeholders should again be notified at the completion of the project when the survey and support vessels are off location.

- Request, in writing, the broadcast by SANHO of a navigational warning via Navigational Telex (Navtext) and Cape Town radio for the duration of the seismic survey activity.
- Distribute a Notice to Mariners prior to the commencement of the seismic survey operations. The Notice to Mariners should give notice of (1) the co-ordinates of the survey area, (2) an indication of the proposed survey timeframes, (3) the dimensions of the towed gear array and dimensions of the safety zone around the seismic vessel, and (4) provide details on the movements of support vessels servicing the project. This Notice to Mariners should be distributed timeously to fishing companies and directly onto vessels where possible.
- An experienced FLO should be placed on board the seismic or escort vessel to facilitate communications with fishing vessels in the vicinity of the seismic survey areas.
- Implement a "soft-start" procedure of a minimum of 20 minutes' duration on initiation of the seismic source during all hours it is confirmed visually by the MMO during the pre-acquisition watch (60 minutes) that there are no shoaling large pelagic fish within 500 m of the seismic source.
- In the case of shoaling large pelagic fish being observed within the mitigation zone, delay the "soft-start" until animals are outside the 500 m mitigation zone.
- Terminate seismic source on
  - Observation of slow swimming large pelagic fish (including whale sharks, basking sharks, and manta rays) within the 500 m mitigation zone.
  - Observation of any obvious mass mortalities of fish (specifically large shoals of tuna or surface shoaling small pelagic species such as sardine, anchovy and mackerel) when estimated by the MMO to be as a direct result of the survey.
  - For slow swimming large pelagic fish, terminate source until such time as the animals are outside of the 500 m mitigation zone (seismic "pause", no soft-start required).
- For the duration of the survey, circulate a daily survey schedule (look-ahead), via email, to key fishing associations.
- Establish a functional grievance mechanism that allows stakeholders to register specific grievances related to operations, by ensuring they are informed about the process and that resources are mobilized to manage the resolution of all grievances, in accordance with the Grievance Management procedure.

9.3.2.3 UNPLANNED EVENTS

9.3.2.3.1 ACCIDENTAL RELEASE OF OIL AT SEA

Oil spilled in the marine environment would have an immediate detrimental effect on water quality, with toxic effects potentially resulting in mortality (e.g. suffocation and poisoning) or sub-lethal (e.g. respiratory damage) effects on marine fauna. An oil spill can also result in several indirect impacts on fishing. These include:

- Exclusion of fisheries from polluted areas and displacement of targeted species from normal feeding / fishing areas, both of which could potentially result in a loss of catch and / or increased fishing effort;
- Mortality of animals (including eggs and larvae) leading to reduced recruitment and loss of stock (e.g. mariculture); and
- Gear damage due to oil contamination.

Oil contamination could potentially have the greatest impact on commercial fisheries for rock lobster and sessile filter feeders (e.g. mussels) and grazers (e.g. abalone). Mortality is expected to be high on filter feeders and, to

a lesser extent, grazers. These species have low mobility and no means to escape contamination and ultimately mortality. Thus, mariculture facilities could be impacted if a spill extended into these areas. For a large oil spill, fishing / mariculture activities and revenues could be affected over a wide area until such time as the oil has either been dispersed or broken down naturally.

The Reconnaissance Permit area coincides with fishing grounds used by the large pelagic longline sector only. Thus, any spill within the Reconnaissance Permit application area, could impact this sector. The dominant wind and current direction will ensure that any spill in the Application Area is dispersed in a north-westerly direction away from the more actively fished areas inshore of the Reconnaissance Permit application area. An offshore spill is likely to disperse rapidly (days). Without the implementation of mitigation measures, the potential impact on the offshore fishing sectors is considered to be of local extent for small instantaneous spills, of regional for larger volumes spills and of moderate magnitude in the short-term. The potential impact on commercial fishing operations is assessed to be of LOW NEGATIVE significance due to the improbable likelihood of such an event occurring.

In the case of a spill en route to the survey area (i.e. during a vessel accident), the spill may reach the coastline. Nearshore fishing (linefish and small-scale fisheries) and mariculture operations (abalone and mussel) would be at risk of the effects of an oil spill (refer to the marine fauna assessment report (Pulfrich, 2022)). The greatest risk of contamination is on sessile filter feeding (e.g. mussels and oysters) and grazing species (e.g. abalone) via physical clogging and or direct absorption of the contaminant, leading to mortality.

With the implementation of the above-mentioned intrinsic mitigation measures, the residual impact would be of LOW NEGATIVE significance for offshore or for nearshore spills.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Impact of Accidental Release of Oil at Sea on Fisheries Sectors (Offshore)	Operation	Low	Low	Low
Impact of Accidental Release of Oil at Sea on Fisheries Sectors (Nearshore)	Operation	Low	Low	Low
Mitigation Measures				
• Ensure personnel are adequately trained in both accident prevention and immediate response, and resources are available on each vessel. • Use low toxicity dispersants. • Ensure adequate resources are provided to collect and transport oiled birds to a cleaning station. • Ensure offshore bunkering is not undertake in the following circumstances: o Wind force and sea state conditions of ≥6 on the Beaufort Wind Scale; o During any workboat or mobilisation boat operations; o During helicopter operations; o During the transfer of in-sea equipment; and o At night or times of low visibility. • Ensure that solid streamers rather than fluid-filled streamers are used. Alternatively, low toxicity fluid-fill streamers could be used.				

9.3.2.3.2 LOSS OF EQUIPMENT AT SEA

These activities (or event) are described further below:

- Irretrievable loss of equipment to the seabed during seismic acquisition; and
- Accidental loss of paravanes, streamers, arrays, and tail buoys during seismic acquisition.

During seismic acquisition, the survey vessel tows a substantial amount of equipment; the deflectors or paravanes, which keep the streamers equally spread are towed by heavy-duty rope, and the streamers themselves are towed by lead-in cables. Each streamer is fitted with a dilt float at the head of the streamer, numerous streamer mounts (birds and fins) to control streamer depth and lateral positioning, and a tail buoy to mark the end of the streamer. Streamers are neutrally buoyant at the required depth, but have buoyancy bags embedded within them that inflate at depth. If streamers are accidentally lost, they would float in the water column for some time before sinking. Dilt floats and tail buoys would ultimately be dragged down under the weight of the streamer. Airguns are suspended under floats by a network of ropes, cables, and chains, with each float configuration towed by an umbilical. Should both the float and umbilical fail, the airguns would sink to the seabed.

The potential impacts (direct) associated with lost equipment include:

- Potential snagging of demersal gear with regards to equipment that sinks to the seabed; and
- Potential entanglement hazards with regards to lost streamers, arrays and tail buoys drifting on the surface or in the water column.

The accidental loss of equipment onto the seafloor would provide a localised area of hard substrate in an area of otherwise unconsolidated sediments. The Reconnaissance Permit area does not coincide with fishing grounds of any demersal fishing sectors thus snagging of demersal gear is considered to be unlikely.

The loss of streamers and floats could result in entanglement hazards in the water column before the streamers sink under their own weight. In the unlikely event of streamer loss, associated impact could be highly localised and limited to the site (although would potentially float around regionally) over the short-term. The impact magnitude for equipment lost to the water column is, therefore, considered to be low and of LOW NEGATIVE significance to the large pelagic longline fishery.

The implementation of the mitigation measures will reduce the impact; however, the residual impact will remain of low magnitude and of LOW NEGATIVE significance.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Impact on Fisheries Sectors of Loss of Equipment at Sea.	**Operation**	**Low**	**Low**	**Low**
Mitigation Measures				
• Ensuring that loads are lifted using the correct lifting procedure and within the maximum lifting capacity of the crane system. • Minimise the lifting path between vessels. • Undertake frequent checks to ensure items and equipment are stored and secured safely on board each vessel. • Retrieval of lost objects / equipment, where practicable, after assessing the safety and metocean conditions. Establish a hazards database listing the type of gear left on the seabed and / or in the survey area with the dates of abandonment / loss and locations and, where applicable, the dates of retrieval.				

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
• Notify SAN#O of any hazards left on the seabed or floating in the water column; and request that they send out a Notice to Mariners with this information. • Ensure at a minimum, one FLO person should be present on board the seismic or escort vessel to facilitate communication with the fishing vessels that are in the area.				

9.3.2.4 CUMULATIVE IMPACTS

The impacts on each of the above fishing sectors could be increased due to the combination of impacts from other projects that may take place during the same period. Cumulative impacts include past, present and future planned activities which result in change that is larger than the sum of all the impacts. Cumulative effects can occur when impacts are 1. additive (incremental); 2. interactive; 3. sequential or 4. synergistic and would include anthropogenic impacts (including fishing and hydrocarbon industries) as well as non-anthropogenic effects such as environmental variability and climate change[26].

In the Benguela region, it has been suggested that the seasonal movement of Longfin Tuna northwards from the west coast of South Africa into southern Namibia may be disrupted by the noise associated with an increasing number of seismic surveys. While the potential exists to disrupt the movement of Longfin Tuna in the Benguela, this disruption, if it occurs, would be localised spatially and temporarily and would be compounded by environmental variability. In Australia, no direct cause and effect in changes in movement or availability of Bluefin Tuna could be attributed to seismic surveys (Evans et al., 2018), with observed changes being attributed to inter-annual variability. Due to the dearth of information on the impacts of seismic noise on truly pelagic species links between changes in migration patterns and subsequent catches thus remains speculative. In addition to the above, the following should also be considered to take account of catch variability and stock declines, which can be attributed to the following (Shomura et al 1995, Kuo-Wie Lan et al 2011, Lehodey et al 2006 and Punt et al 1996):

- Increasing fishing effort exacerbated by improved fish finding technology (vessel monitoring systems, use of sonar, sea surface temperature spatial mapping using satellite technology);
- Environmental variability such as cold and warm water events e.g. Benguela El Niño events have been shown to result in a change in the vertical distribution of tuna stocks within the water column, resulting in reduced catch rates;
- Migration and feeding patterns that change abundance levels annually and are linked to the environment; and
- Inconsistent or irregular catch reporting.

This said, there is the possible chance of an increase in disturbance and disruption to fisheries active in the area and pressure on local services and facilities should additional exploration and mining activities commence (by other applicants or existing exploration right holders) in a relatively short period. There are a number of reconnaissance permit application and EIA / Basic assessments being undertaken for proposed seismic surveys off the West Coast, although it is unlikely that all these will be undertaken as they are targeting similar areas in the Deep Water Orange Basin.

Concurrent activities such as other planned speculative or proprietary seismic surveys in the southern Benguela region could add to the cumulative impact on fisheries. Although it is unlikely that concurrent seismic surveys would be undertaken in the same area during the same survey window, the current report includes an assessment of the cumulative impact on fisheries during simultaneous operations of three regional seismic surveys off the west coast. Simultaneous survey operations would result in an increase in the extent and

[26] Refer to Augustyn et al. (2018) for a synopsis of climate change impacts on South African fisheries.

magnitude of the impact on the large pelagic longline sector. The impact duration would remain unchanged[27]. Three seismic surveys of regional extent, undertaken simultaneously, could be expected to result in an impact of MEDIUM NEGATIVE significance on the large pelagic longline sector and of LOW NEGATIVE significance on the tuna pole-line sector, both with and without the application of mitigation measures. Once completed there is not expected to be any residual impact.

9.3.3 IMPACTS ON HERITAGE

This section provides a description of the Heritage impacts identified by in the HIA. For a more detailed description of the impacts, please refer to the HIA undertaken by PGS Heritage (Pty) Ltd included in Appendix 3.

9.3.3.1 IMPACTS ON CULTURAL HERITAGE

It must be noted that a large section of the affected communities not only view themselves as small-scale fishers but also as indigenous people and, as such, are intrinsically linked to the ocean and the land they have lived on for centuries. The resurgence movement through which Khoi and San descendants are reclaiming their identity has in recent decades afforded these communities the ability to re-establish their cultural roots and grounding in an ancient landscape. This sentiment is echoed in the founding affidavit submitted (5 Feb 2022) during the appeal submitted to the first Searcher application by CJ Adams. It notes that the ocean is not only important for fishing but also has spiritual meaning and is a place of healing and holds healing powers for the indigenous communities. It further expanded that the ocean and its resources play an important part in their community's history and heritage.

Community identity and culture are thus strongly linked to the ocean and what it can provide, physically and spiritually. Communities have coexisted with the ocean for generations. This existence has created a culture and heritage that defines their way of living, community, and kinship unique to the West Coast of South Africa. Cook (2001) describes this as maritimity, a process whereby the sum of cultural adaptations made by coastal populations becomes imbued with meaning and culture. This is evident in community structures, cultural events, and seasonal activities. Their culture and heritage historically had a physical manifestation in village layouts, boat building and the unique west coast architectural vernacular. This vernacular was appropriated by the rich to develop quasi-cultural village expressions in the modern expansions of West Coast towns such as Paternoster.

This uptake of the cultural heritage manifestations or elements of the indigenous communities by the public at large, provides a manner of legitimacy to their culture that is deeply entwined with the ocean and coastal landscape. It, unfortunately, does not translate into economic providence and brings no relief to their plight as subsistence communities. The changes in the fishing economies around the South African coast in the past four decades have resulted in a loss in income and livelihoods. It has inevitably impacted their community structures and activities which are a large part of their cultural heritage.

The public meetings and focused discussions with interlocutors have shown that these communities and groupings are struggling economically due to decades of turmoil in the fishing industry. An industry plagued by the closing of fish processing plants, fishing licence and quota issues, and diminishing catches due to environmental and industrial impacts, to name a few. This economic downturn led to social issues within the communities. Foremost are poverty, loss of social fabric, substance abuse, teenage pregnancies, and violence. In all the interviews, the above issues were raised as central to their social existence and community experience.

Considering the Article 8(j) and 10 Convention on Biological Diversity (29 December 1993), of which South Africa has been a signatory since 1995, the need to "...respect, preserve and maintain knowledge, innovations and practices of indigenous and local communities embodying traditional lifestyles relevant for the conservation and sustainable use of biological diversity and promote their wider application with the approval and involvement of the holders of such knowledge, innovations and practices and encourage the equitable sharing of the benefits arising from the utilization of such knowledge, innovations and practices" must be considered within the

[27] Seismic surveys are undertaken within a window period of December to May as specified by DMRE as part of the EMP conditions to mitigate the impacts on sensitive migration periods for cetaceans.

available South African legislation. As such, the NHRA (section 3) (2)) considers heritage resources that are part of the national estate to include:

- Places to which oral traditions are attached or which are associated with living heritage;
- Or as per subsection 3, has cultural significance or other special values because of –
  - its importance in the community or pattern of South Africa's history;
  - its possession of uncommon, rare or endangered aspects of South Africa's natural or cultural heritage;
  - its potential to yield information that will contribute to an understanding of South Africa's natural or cultural heritage;
  - its importance in demonstrating the principal characteristics of a particular class of South Africa's natural or cultural places or objects;
  - its importance in exhibiting particular aesthetic characteristics valued by a community or cultural group;
  - its importance in demonstrating a high degree of creative or technical achievement at a particular period;
  - its strong or special association with a particular community or cultural group for social, cultural or spiritual reasons; and
  - its strong or special association with the life or work of a person, group or organisation of importance in the history of South Africa.

Culture is more than just the tangible but is also shared beliefs, values, language, traditions, functionality, meaning and community connections. Considering the various values and heritage significance as listed in section 3(3) of the NHRA, the cultural and living heritage associated with the communities and indigenous people along the southwestern and west coast of South Africa holds heritage significance. It is part of the national estate and holds importance as a way of life for small-scale fishers and Khoisan descendants alike. The physical and spiritual interaction with the ocean and the shorelines through millennia resulted in a maritimity that developed into the cultural fabric as they experience it today.

The significance of such intangible and living cultural heritage features can potentially have a combined heritage grading of Grade II or even Grade I through further research. However, grading inevitably implies the investigation into and consideration of a Provincial or Heritage declaration of significance for a largely intangible cultural heritage. This is problematic as the NHRA provides for the proclamation/declaration of place, objects, or structures as Provincial or National Heritage Sites and only refers to intangible/living heritage relating to such place, objects, or structures.

The cultural heritage and living heritage related to the communities linked to fisheries and ocean subsistence and further identifying as indigenous communities can potentially be impacted by the proposed project. This impact is indirect and is in the community perceived to be primarily linked to their economic existence as a result in the loss of fishing yield. Investigation and discussion have shown that the historic economic decline of fisheries has resulted in the loss of social cohesion, activities, and traditions.

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
Impact on Cultural Heritage	**Operation**	**Medium**	**Low**	**Low**
Mitigation Measures				
• Implement recommended mitigation measures as listed in the other specialist reports for the project.				

Impact	Phase	Pre-mitigation Impact	Post-mitigation Impact	Final Significance
• Re-assess post-project the potential effects on the identified communities and their intangible cultural heritage. This will require consideration of the socio-economic baseline developed during this environmental impact process against quantified economic damage and losses and human development impacts in a follow-up socio-economic assessment. It will enable the heritage specialist to evaluate the link between the socio-economic changes induced by the proposed project as it relates to changes in the intangible cultural heritage practices of the communities. Based on the outcomes, provide resources and support for communities to develop and undertake safeguarding measures or plans to enhance the mitigation capacity of their intangible cultural heritage by fostering dialogue, mutual understanding and reconciliation between and within communities. It is anticipated that this can be achieved through the implementation of the mitigation measures in the Social Impact Assessment. • 3D seismic surveys have the potential to locate wrecks on the surface, and sometimes below sediments on the ocean floor. Any shipwrecks or pieces thereof noted during the survey must be shared with the SAHRA MAIOH Unit for inclusion into the national database. These could then be identified and be incorporated into the EMPr.				

9.3.3.2 CUMULATIVE HERITAGE IMPACTS

The heritage specialist is aware of at least one other current application and the potential of another application soon occurring in the Orange Basin. Communities have expressed a definite concern about the multiple applications occurring in their fishing waters and the potential long-term effect of these surveys resulting in Oil and Gas companies starting applications for production rights based on the findings of these reconnaissance surveys. It is foreseeable that continued seismic surveys could add to the overall load of impacts on fish population that indirectly could impact community livelihoods and thus their way of living and cultural heritage. At this stage, cumulative impacts are purely speculative. Still, the potential for the future increase in cumulative impacts due to current and future seismic surveys and the potential for future Oil and Gas production cannot be excluded but is not quantifiable at this stage for cultural heritage.

9.3.4 SOCIAL IMPACTS

This section provides a description of the Social Impacts identified by in the Social Impact Assessment (SIA). For a more detailed description of the impacts, please refer to the SIA undertaken by Equispectives Research & Consulting Services included in Appendix 3.

Social impacts are the result of social change, and to fully understand the potential impacts it is important to know the impact pathways. A social change process is a discreet, observable and describable process that changes the characteristics of a society, taking place regardless of the societal content (that is, independent of specific groups, religions etc.). Social change processes can be measured objectively. The way in which social change processes are perceived, given meaning or valued, depend on the social context in which various societal groups act. Some groups in society are able to adapt quickly and exploit the opportunities of a new situation. Others (e.g. vulnerable groups) are less able to adapt and will bear most of the negative consequences of change. These social change processes may, in certain circumstances and depending on the context, lead to the experience of social impacts. Social impacts are therefore completely context dependent.

9.3.4.1 UNCERTAINTY

The fishing communities are uncertain about the impact that the seismic survey will have on their livelihoods. They feel that there is not enough information available to them to determine whether the surveys will have an impact on their activities. In the past year a number of companies approached them to participate in EIA processes about seismic surveys. They want to have some definitive answers about the potential impacts from specialists. They would like to engage with them for more than two hours to make sure that they understand exactly what the project entails and what the potential impacts are. Only then will they be able to make informed decisions. The fishing communities have made a living from the sea for hundreds of years and they have learned

how to read the ocean and the weather to know where and when fish are moving. They are concerned that the surveys could disrupt the behaviour of snoek (that is endemic to the area and a major source of income) and other fish that they rely on. They have noticed changes in the patterns of the fish they catch due to industrial activities in the past. Some examples are the potato factory in Lambert's Bay that discharges warm water in the sea and the cofferdams constructed by the diamond mines. After a previous seismic survey at the Wild Coast, people observed dead Black Steenbras that were reported to have protruding nostrils. Furthermore, they also noticed changes in the patterns of the fish that they ascribed to climate change. For the fishing communities, the sea is an integral part of their identity, and they possess local knowledge that are not yet written up in scientific reports.

The marine fauna and fisheries reports indicate that low to negligible impacts on marine life and that all the impacts are reversible. However, the communities are not convinced. According to them, the fish can either go deeper in the sea to get away of the source of noise, which would be a tragedy for them, or they can go closer to the shore, which would be beneficial for them. They feel that no-one can predict with certainty how the fish would respond to the noise, just that they would try to move away from the source.

The impact of seismic surveys on the catchability of marine fish remains a contentious issue for communities, with some claims that seismic surveys may negatively affect catch rates. However, little empirical evidence exists to quantify the impact or identify the mechanisms of such impact. The communities feel that there is simply not sufficient data available to negate or substantiate these claims and much more research on the topic is needed, especially from a local perspective. The consensus seems to be that there is a great knowledge gap in this regard. Community members feel that companies doing seismic surveys or those who have an interest in the data obtained through seismic surveys can make a great contribution to scientific knowledge of this field by funding independent research on the topic in South African waters.

People's livelihoods are already impacted by external factors such as fishing quotas, climate change, commercial over-fishing, mining in the sea and the recent Covid pandemic. They fear that the seismic surveys will contribute to an already dire situation and be a tipping point that will render them helpless and without their last source of income. They see seismic surveys as a gateway to oil and gas exploration and are concerned about the potential impacts that the results of the seismic surveys can unlock. There is a high level of uncertainty about the future of the ocean, which causes great concern and distress amongst the fishing communities, especially because the uncertainty is related to their livelihoods, and they are already struggling to make ends meet. Uncertainty also takes its toll on people psychologically and may result in mental health issues for some people in the long run.

Impact	Phase	Pre-mitigation ER	Post-mitigation ER	Final Significance
Uncertainty	Operation	High	Medium	Medium
Mitigation Measures				
• TGS should develop a community engagement protocol that is based on the San Code of Research Ethics. This should be done in consultation with the affected communities. This should include a communication strategy and grievance mechanism. • TGS should contribute to assisting with collaboration on independent research on how fish species on the West Coast such as snoek respond to seismic surveying. TGS will further contact relevant scientific research institutions to offer the potential of collaborating in independent on-water research during the survey. • Consult with communities on potential ways in which to make a positive contribution to the communities.				

9.3.4.2 **FURTHER MARGINALISATION OF VULNERABLE GROUPS**

In South Africa, claims for and access to natural resources are deeply embedded in people's histories, identities, and livelihood experiences. As in the case of land, access to and rights over fisheries resources is a highly contested issue where individuals and communities have equated such rights with human rights (Williams,2021).

Globally, fishing activities for many communities sees strong cultural and traditional links spanning many generations, and its value is seen beyond the means of earning a living (i.e. economic values). Whilst fishing takes place at sea, other activities related to fishing such as boat and net maintenance, the selling and trading of fish, etc. take place on land. Men and women are involved in fishing and indigenous knowledge and skills such as gutting and cleaning fish, reading the sea, and finding fish are transferred from generation to generation. The activities associated with fishing create a particular identity or characterise an area as a result of these activities (Williams,2021). Fishing is part of the cultural identity of the people living in fishing villages on the West Coast.

Many of the people on the West Coast belong to the Nama, Khoi or San people. Most of the Khoi people were traditionally cattle or sheep herders, while the San people were traditionally hunters and gatherers (www.san.org). They were the first inhabitants of southern Africa and one of the earliest distinct groups of homo sapiens. They have endured centuries of gradual dispossession at the hands of waves of new settlers, including the Bantu, whose descendants make up most of the black population of South Africa (https://foreignpolicy.com/2018/10/19/south-africas-first-nations-have-been-forgotten-apartheid-khoisan-indigenous-rights-land-reform/). The process of land distribution instituted by the Government since 1994 has largely excluded the Khoi and the San people, as the government has not acknowledged them as the country's first peoples and their land was mostly taken before the apartheid era. There is a growing movement of indigenous activists that believe it is time to rightfully claim their traditional land.

One of the Khoi and San's biggest challenges is the racial classification system used in South Africa. They are being classified as 'Coloured' - a label that was used during Apartheid for citizens that did not fit the binary race model and included mixed-race children and Afrikaans-speaking non-whites. This categorisation condemned much of the Khoi and San's history to oblivion and facilitated the appropriation of their land. It excluded them from land restitution as it was conceived to be a benefit to black South Africans, and they were not considered to be black. As such the Khoi and San are considered to be very vulnerable and marginalised groups. Being marginalised means that they may easily be overlooked by corporate groups or businesses unfamiliar with the local history. Their needs, their views and even themselves as a stakeholder group can easily be omitted – both intentionally and unintentionally. In a previous application for a seismic survey by another company in the area the Khoi and San felt that they were not consulted with. Therefore, they are sceptic about the intentions of any company doing seismic surveying. They felt that they were discriminated against by not being consulted during that previous application, deepening their status as marginalised groups, and causing distraught to them as groups. Many of the fishers are of Khoi and San descendance, and they feel that they simply cannot win in any situation – whether it is fishing rights, land rights or culture identity.

With increasing interest in the West Coast area by seismic surveyors, which is viewed as the precursor for oil and gas companies to start developing the area, these communities risk increased marginalisation and an increase in vulnerability with every application where their voices are not being heard. They feel that currently they need to fight to make their voices heard. They have been using legal avenues, as they feel that just speaking up is not effective and has failed to give them the desired outcomes. Communities feel that their cultural heritage is threatened.

The San has published the San Code of Research Ethics that provides a guideline for researchers and companies that want to work in their sphere of influence on how to conduct themselves and how to interact with the San. From their perspective, an EIA application is also viewed as a form of research. This guideline can be applied to the Khoi and other people in the fishing communities as well. The San Code of Research Ethics is based on:

- Respect for individuals, community and culture;
- Honesty;
- Justice and fairness;

- Care; and
- Process (following San research protocol).

The San Code of Research Ethics states that lack of care can be demonstrated by talking down to communities, confusing them with complicated scientific language, or treating communities as ignorant. It further states that a lack of care is also represented by failing to ensure that something is left behind that improves the lives of the San.

Impact	Phase	Pre-mitigation ER	Post-mitigation ER	Final Significance
Further marginalization	Operation	[illegible]	Medium	Medium
Mitigation Measures				
• TGS should develop a community engagement protocol that is based on the San Code of Research Ethics. This should be done in consultation with the affected communities. This should include a communication strategy and grievance mechanism. • TGS should contribute to assisting with collaboration on independent research on how fish species on the West Coast such as snoek respond to seismic surveying. TGS will further contact relevant scientific research institutions to offer the potential of collaborating in independent on-water research during the survey. • Consult with communities on potential ways in which to make a positive contribution to the communities. • A representative from TGS should consult with the traditional leadership of the affected communities to establish what their understanding of meaningful consultation is and how communities should be consulted in future. This will assist with adjusting the relationship between TGS and the traditional communities. Given the socio-political environment, opposition to the project and associated non-technical risks, further meaningful engagement with the leadership and communities are critical from a social perspective. • TGS should initiate discussions in their industry. The seismic survey industry should reassess their position and social licence to operate as an industry in a South African context and conduct a strategic environmental assessment of the impact of the industry and embark on an awareness raising and education campaign. Having meetings will not be sufficient. Participatory processes and workshops where communities can engage in experiential learning should be considered. If the seismic survey industry fails to address the community's need for education and cooperation it will result in significant delays and increase the risk for social unrest.				

9.3.4.3 CONCERNS ABOUT CUMULATIVE IMPACTS

A great source of concern for the fishing communities is the effect of cumulative impacts on their livelihoods and sense and spirit of place. There are a number of applications in process as well as approved applications relating to seismic surveys, mining, and oil and gas exploration in the West Coast area. There are also existing mining activities, significant shipping traffic and commercial fishing taking place in the ocean. The concern is that at some stage a tipping point will be reach where the marine life no longer recovers from the activities in the ocean or take a long time to recover to the extent that it would no longer be viable to make a living from the sea in those areas. In Norway small-scale fishing successfully co-exists with oil extraction in the ocean, but for the small-scale fishers on the West Coast, it remains uncertain to what extent it will be the case for them as well. Although cumulative impacts are assessed as part of the EIA process, there are limitations associated with budgets, timeframes, and access to resources. The competent authorities have a legal and moral duty to consider the cumulative impacts of the activities taking place and are planned to take place on the livelihoods and heritage of the vulnerable communities in the area from a strategic perspective. There must be a balance between the contribution these activities can make to South Africa's economy and sustaining the livelihoods of

the vulnerable communities on the West Coast. The communities are clear that they do not necessarily want to stop development, they want to make sure that their livelihoods and heritage are protected, and that the rights of future generations will not be compromised. Once these have been affected negatively, it may not be possible to easily undo the damage.

Impact	Phase	Pre-mitigation ER	Post-mitigation ER	Final Significance
Cumulative social impact concerns	Operation	[illegible]	Medium	Medium
Mitigation Measures				
• TGS should approach the authorities and enter into conversation regarding a strategic impact assessment for the area that should be contributed to by all the production/ exploration companies involved.				

9.3.4.4 PERCEIVED IMPACT ON LIVELIHOODS

A livelihood refers to the way of life of a person or household and how they make a living, in particular, how they secure the basic necessities of life, e.g., their food, water, shelter and clothing, and live in the community (Vanclay et al., 2015). The coastal communities in the area of interest are mostly fishing communities that make their livelihoods from the sea and have been doing so for generations. They rely on the ocean for food and economic security, as well as their identity and heritage. They know how to make a living from the sea. If it is no longer possible for them to make a living from the sea, or if their ability to make a living from the sea is reduced it will result in a great increase in poverty in the area as there are very limited alternative options for them to make a livelihood. Their skill sets are strongly linked to the sea and cannot be transferred to other economic activities without skills development, training activities and the economic diversification of the area. Men and women rely on the sea for their livelihoods, and it is closely linked to the culture and identity of the people. This makes these communities extremely vulnerable. Furthermore, an increase in poverty in the area will place an additional burden on tax payers.

The small-scale fishers can travel approximately 15 nautical miles offshore with their boats. Some of them have indicated that they already sometimes need to go further to be able to catch enough fish, which is not only more expensive for them in terms of the diesel required for their boats, but it is also more dangerous. In the mining areas around Port Nolloth they are struggling to get access to the sea and the areas where they are allowed to fish are getting smaller.

Livelihoods are already compromised due to the fishing quota system, over-fishing, lack of employment opportunities, pollution, effects of climate change and the recent Covid 19 pandemic. However, with reference to the assessment of the impacts on the catch rates from the fisheries assessment undertaken by CapMarine (2022), the impact on livelihoods is not because of the actual impact on catch rates, but because of the perceived impact of the oil/gas industry on fishing industry.

Impact	Phase	Pre-mitigation ER	Post-mitigation ER	Final Significance
Perceived impact on livelihoods	Operation	Medium	Medium	Medium
Mitigation Measures				
• TGS should develop a community engagement protocol that is based on the San Code of Research Ethics. This should be done in consultation with the affected communities. This should include a communication strategy and grievance mechanism.				

Impact	Phase	Pre-mitigation ER	Post-mitigation ER	Final Significance
• TGS should contribute to assisting with collaboration on independent research on how fish species on the West Coast such as snoek respond to seismic surveying. TGS will further contact relevant scientific research institutions to offer the potential of collaborating in independent on-water research during the survey. • Consult with communities on potential ways in which to make a positive contribution to the communities. • A representative from TGS should consult with the traditional leadership of the affected communities to establish what their understanding of meaningful consultation is and how communities should be consulted in future. This will assist with adjusting the relationship between TGS and the traditional communities. Given the socio-political environment, opposition to the project and associated non-technical risks, further meaningful engagement with the leadership and communities are critical from a social perspective. • TGS should initiate discussions in their industry. The seismic survey industry should reassess their position and social licence to operate as an industry in a South African context and conduct a strategic environmental assessment of the impact of the industry and embark on an awareness raising and education campaign. Having meetings will not be sufficient. Participatory processes and workshops where communities can engage in experiential learning should be considered. If the seismic survey industry fails to address the community's need for education and cooperation it will result in significant delays and increase the risk for social unrest.				

9.3.4.5 IMPACTS ON SENSE AND SPIRIT OF PLACE

Sense of place refers to an individual's personal relationship with his/her local environment, both social and natural, which the individual experiences in his/her everyday daily life (Vanclay *et al*, 2015). It is highly personal, and once it is affected, it cannot be restored. It is also difficult to quantify. The environmental philosopher Glenn Albrecht noted a consistent theme of distress caused by coal mining in Australia by the assault on the people's sense of identity, place, belonging, control, and good health. He identified a melancholia from the loss of solace and comfort connected with their home which he termed 'solastalgia' – a form of homesickness that one gets when one is still at 'home' associated with the major project impacts they experienced (Albrecht *et al*, 2007). Social impacts can therefore range from significant health impacts to the loss of a cherished landscape and associated loss of a sense of place.

Spirit of place refers to the unique, distinctive, and cherished aspects of a place. Whereas 'sense of place' is the personal feelings an individual has about a place, spirit of place refers the inherent characteristics of the place (Vanclay *et al*, 2015). In this case the spirit of place includes the ocean and the properties assigned to it.

Many things can impact on a person's perception of sense of place. For the fishing communities the ocean is an integral part of their being, therefore anything that is perceived to potentially harm the ocean would also cause harm to them. The ocean provides them with food and thus keeping them from starvation. For many the sea is a sacred place. Its water has healing powers that take care of the sick. Many loved ones have given their lives to the ocean while they were out trying to make a living, and their remains have never been found. The sea kept their bones, making the ocean the graveyard where their loved one's rest. For some people the thought of disturbance in the sea causes great distress. The heritage aspects relating to this are discussed in the heritage impact assessment report. Although this cultural and spiritual connection with the sea might be difficult to understand for outsiders, it must be respected as a cultural right.

Impact	Phase	Pre-mitigation ER	Post-mitigation ER	Final Significance
Impact on sense of spirit and place	Operation	Medium	Medium	Medium

Impact	Phase	Pre-mitigation ER	Post-mitigation ER	Final Significance
Mitigation Measures				
• TGS should develop a community engagement protocol that is based on the San Code of Research Ethics. This should be done in consultation with the affected communities. This should include a communication strategy and grievance mechanism. • Consult with communities on potential ways in which to make a positive contribution to the communities.				

9.3.4.6 **IMPACTS ON THE SOCIAL LICENCE TO OPERATE**

Social licence to operate (SLO) is a popular expression to imply that the acceptance of the community is also necessary for a project to be successful. It appears as if TGS does not currently have social licence to operate in the fishing communities. Based on the events surrounding previous applications and recent reports about seismic surveys in the media, the communities expressed that they do not trust TGS or any other company conducting seismic surveys. Applications for seismic surveys and community opposition to these surveys have been widely reported and debated in the media during the last year (Compare News 24, 13 Jan 2022; Mail and Guardian, 20 Jan 2022; Eye Witness News, 1 September 2022 amongst others). Numerous NGOs specialising in social and environmental justice have aligned with communities and assist them with opposing seismic surveys. Some community members think that seismic surveys are opening the door for oil and gas exploration, which is a great concern for them, mostly due to the anticipated impacts on their livelihoods.

Given that there are a number of applications for seismic surveys in the Orange Basin, and that each application is subjected to a Basic Assessment process, communities are confused and reaching saturation regarding consultation. From their perspective, with each new application, it is a new face standing in front of them, from a new company, but "basically everyone wants the same thing". Communities do not distinguish between different seismic survey companies. They feel as if their questions are not answered, and concerns are not addressed – each consulting firm just repeat the same technical information about what a seismic survey entails to them. Although this is not TGS's fault and they are following a prescribed legal process, it impacts on their social licence to operate and on the seismic survey industry as a whole.

The term "social fabric" embraces numerous complex and interrelated phenomena, including demographic and economic factors, behavioural issues (e.g. investment choices, political dynamics), social institutions (e.g. families), social organisations (e.g. municipalities and churches), and social networks, or relationships amongst people. The social fabric is underpinned by people's beliefs and sentiments, including a sense of belonging and identification with a particular social unit (Atkinson et al, 2017).

The social fabric in the communities have been damaged through previous negative experiences with businesses in the area. A number of factories in the greater area have closed or moved away and in the process of doing so created great hardship for the communities remaining behind. Very little severance was paid, and this aggravated the communities. Mines closed without proper rehabilitation plans. In some places, access to the areas where they earn their livelihoods are becoming increasingly restricted, especially through the activities of mining companies. This has reached a point where the communities have realised that they need to fight for the protection of their livelihoods as historically companies have in most cases not treated them fairly or with respect. It is unlikely that any company that would like to undertake an activity in the ocean will be given social licence to operate by the community. The community have been traumatised by historical events and behaviour of companies too many times. On the other hand, there are members in the community that welcome any new development and feel that living from the sea has its limitations and would soon be impossible. The dynamics between the different groups in the community, caused by the myriad of seismic survey applications, has already done significant harm to the social fabric of the fishing communities. People with individual agendas cause conflict in the community, and given the vulnerability of the community, the dire socio-economic conditions and

high levels of poverty, illiteracy and unemployment, community members are susceptible to these forms of manipulation.

Another aspect that affects TGS's current social license to operate negatively, is that previous applicants such as Searcher and Shell failed to conduct sufficient meaningful consultation with the small-scale fishers in the past. The MPRDA Regulations as amended in 2020 define meaningful consultation as: consulting in good faith, in a way that gives the landowner, lawful occupier and/or interested and affected persons all the relevant information, and reasonable time and opportunity to make an informed decision regarding the impact of the proposed activities.

The communities feel disrespected and marginalised by the processes followed up to date by previous applicants in the area. Engaging with the communities in a meaningful way, following the appropriate structures and protocols, will go a long way in improving TGS's social license to operate. It does not guarantee that the communities will accept TGS or any other company wanting to conduct seismic surveys. It must be kept in mind that improving social license to operate takes time and effort.

Impact	Phase	Pre-mitigation ER	Post-mitigation ER	Final Significance
Impacts on the social license to operate	Operation	High	Medium	Medium
Mitigation Measures				
• TGS should develop a community engagement protocol that is based on the San Code of Research Ethics. This should be done in consultation with the affected communities. This should include a communication strategy and grievance mechanism. • Consult with communities on potential ways in which to make a positive contribution to the communities. • A representative from TGS should consult with the traditional leadership of the affected communities to establish what their understanding of meaningful consultation is and how communities should be consulted in future. This will assist with adjusting the relationship between TGS and the traditional communities. Given the socio-political environment, opposition to the project and associated non-technical risks, further meaningful engagement with the leadership and communities are critical from a social perspective. • TGS should initiate discussions in their industry. The seismic survey industry should reassess their position and social licence to operate as an industry in a South African context and conduct a strategic environmental assessment of the impact of the industry and embark on an awareness raising and education campaign. Having meetings will not be sufficient. Participatory processes and workshops where communities can engage in experiential learning should be considered. If the seismic survey industry fails to address the community's need for education and cooperation it will result in significant delays and increase the risk for social unrest.				

9.3.4.7 **STAKEHOLDER FATIGUE AND DISILLUSIONMENT**

Signs of stakeholder fatigue are visible in the communities. Stakeholder fatigue may occur where many stakeholder initiatives have taken place in the past, especially in circumstances where they did not lead to tangible outcomes for stakeholders. There are a number of applications for seismic surveying, exploration and mining in the area that the stakeholders were invited to. The most obvious way to deal with this would be to avoid working with communities, suffering from stakeholder fatigue (Durham *et al*, 2014), but this is not always possible and infringes on their rights. The EIA process requires public participation and information sharing. The volume of consultation and information shared are confusing to the communities. Stakeholders start to feel overloaded, which negatively affects their willingness to participate and lessens the quality of their input. Over time only those who are deeply interested, that are strongly supportive of or strongly opposing may still participate. This can hinder potential projects, and can particularly occur when the stakeholders consulted are

not actively involved in decision-making. To be effective and to reduce stakeholder fatigue, engagements need to be targeted, with clear aims and results. Stakeholders need to be clear on what the goal or end benefits to themselves would be for participating. It must be kept in mind that the more stakeholders contribute their time and knowledge, the more they will expect in return from the project, so one always need to ensure that the relationship remains balanced.

Related to stakeholder fatigue is stakeholder disillusionment, which can occur during a project or can be a legacy of past involvement in stakeholder participation. Disenchantment can result from failure to manage credibility, relevance and legitimacy, particularly when communication is poor or expectations are not met. Stakeholders can feel let down from previous involvement and disenchantment can also result from failure to keep promises. A number of stakeholders have already indicated that they feel their voices don't matter and participating in all the processes are not making a difference.

Credibility, relevance, and legitimacy can be enhanced when (www.IZinsights.org):

- Other invited stakeholders are considered to be appropriate;
- Stakeholders with opposing views who are included are generally respected;
- There are clear objectives;
- The processes used are transparent and seen to be appropriate;
- There is continuity in the participation, allowing relationships to be maintained, trust to be developed, and stakeholder knowledge and skills to be built on;
- Attention is paid to appropriate timing of participation processes;
- Results are delivered in a timely manner;
- The participation and communication processes are effective and ongoing throughout the application process;
- Participation is adapted to changing circumstances;
- Understandable language is used;
- The process for participation for all stakeholders is clearly stated and appropriate;
- Stakeholders feel that their interests have been understood and taken into account;
- The multiple stakeholders involved are seen to be a balanced group; and
- Use unbiased facilitators where possible.

TGS can only influence what happens in their own application. By attending to issues discussed and keeping promises made to stakeholders, they give their own application process the best possible chance and make it more likely that stakeholders will participate in the future.

Impact	Phase	Pre-mitigation ER	Post-mitigation ER	Final Significance
Impacts on the social license to operate	Operation	Medium	Low	Medium
Mitigation Measures				
• TGS should develop a community engagement protocol that is based on the San Code of Research Ethics. This should be done in consultation with the affected communities. This should include a communication strategy and grievance mechanism.				

Impact	Phase	Pre-mitigation ER	Post-mitigation ER	Final Significance
• Consult with communities on potential ways in which to make a positive contribution to the communities. • A representative from TGS should consult with the traditional leadership of the affected communities to establish what their understanding of meaningful consultation is and how communities should be consulted in future. This will assist with adjusting the relationship between TGS and the traditional communities. Given the socio-political environment, opposition to the project and associated non-technical risks, further meaningful engagement with the leadership and communities are critical from a social perspective.				

9.3.4.8 COMMUNITY EXPECTATIONS

Not everyone in the fishing communities is opposed to the project or to oil and gas exploration. Their perceptions are that the ability to make a living from the sea is already declining. It is a hard live and they want a better life for their children. There are very limited alternative opportunities for making a livelihood and very limited job opportunities. They will support industrial development in the area if it brings opportunities for their children for employment and skills development. They want to know that they will benefit from the process that will be set in motion by the seismic surveys. They know they will not be direct beneficiaries from the extraction of oil and gas, but that they will be the ones that pay the price. Their expectations are that the oil and gas companies will invest in these communities and assist them with creating alternative livelihoods and obtaining the necessary skills and experience in that regard. Although TGS will be doing a survey to gather data that will be utilised by oil and gas companies, and TGS's activities will be of a temporary nature, with little benefit to the locals, the communities do not distinguish between data collection and exploration or extraction. For them these companies are one and the same, and they have similar expectations of TGS.

The proposed project collects data that would be of great value for the companies interested in extracting oil and gas in the area in future. Should this happen, it would have a positive impact on the economy of South Africa, seen together with the Government's plans for the development of a new industrial port at Boegoebaai. In a country with very high unemployment levels and suffering from a recession and an energy crisis, this is seen as a positive future development by many role players. As such, the communities feel that the government supports the application, and that community consultation is simply a matter of ticking the boxes. The question of who pays the price and who gets the benefit is relevant in this context. The price that the fishing communities will pay eventually, will be high as it may have an extremely negative impact on their livelihoods with little or no benefit to them, unless measures are put in place to protect their livelihoods. It must be considered that community livelihoods are broader than just catch rates and fishing, but includes the capabilities, assets (including both material and social resources) and activities required for a means of living.

Impact	Phase	Pre-mitigation ER	Post-mitigation ER	Final Significance
Community Expectations	Operation	**Medium**	**Medium**	**Medium**
Mitigation Measures				
• TGS should develop a community engagement protocol that is based on the San Code of Research Ethics. This should be done in consultation with the affected communities. This should include a communication strategy and grievance mechanism. • Consult with communities on potential ways in which to make a positive contribution to the communities. • TGS should investigate opportunities for the employment of people from local communities and skills development.				

9.3.4.9 SOCIAL UNREST

Generally, social unrest occurs when a group gathers publicly to express dissatisfaction or anger centred around a common cause and is usually accompanied by a demand for societal change. Poor socio-economic conditions caused by unemployment rates, corruption, inflation, and bad governance can contribute to social unrest. South Africa has a history of using protests to air grievances. Social unrest is often triggered by an event or action that provokes strong feelings amongst community members.

Some of the communities are adamant that they would not allow gas or oil extraction in the area, and that includes collecting the required data from the ocean. There have already been court cases in this regard, and there are also court cases that are ongoing. Some community members have threatened with violence against surveying vessels. Others have threatened that they will take action to fight seismic surveys, in any way that they seem appropriate. This is a very emotional issue for many people and that could erupt into social unrest. Related to this is potential for conflict between community members who support the project and those that are against the project.

Impact	Phase	Pre-mitigation ER	Post-mitigation ER	Final Significance
Social Unrest	Operation	Medium	Low	Medium
Mitigation Measures				
• TGS should develop a community engagement protocol that is based on the San Code of Research Ethics. This should be done in consultation with the affected communities. This should include a communication strategy and grievance mechanism. • Consult with communities on potential ways in which to make a positive contribution to the communities. • A representative from TGS should consult with the traditional leadership of the affected communities to establish what their understanding of meaningful consultation is and how communities should be consulted in future. This will assist with adjusting the relationship between TGS and the traditional communities. Given the socio-political environment, opposition to the project and associated non-technical risks, further meaningful engagement with the leadership and communities are critical from a social perspective. • TGS should initiate discussions in their industry. The seismic survey industry should reassess their position and social licence to operate as an industry in a South African context and conduct a strategic environmental assessment of the impact of the industry and embark on an awareness raising and education campaign. Having meetings will not be sufficient. Participatory processes and workshops where communities can engage in experiential learning should be considered. If the seismic survey industry fails to address the community's need for education and cooperation it will result in significant delays and increase the risk for social unrest.				

9.3.5 CUMULATIVE NOISE IMPACTS ASSOCIATED WITH MULTIPLE SURVEYS

Should other seismic survey campaigns be undertaken concurrently with TGS's proposed survey programme (although highly unlikely to be undertaken in the same area during the same survey window due to impacts on operation and data acquisition), cumulative impacts may be likely and there would need for alignment in planning of such concurrent operations in order to reduce cumulative impacts to an acceptable significance in terms of concurrent noise impacts. Current pending applications at PASA include the Searcher Geodata seismic survey application (PASA ref 12/1/043), as well as the GX Technology Corporation[28] survey application (ref 12/1/042), which both overlap the area proposed for the TGS 3D survey (Figure 117). It is understood that there

28 It is understood that ION GXT has been declared bankrupt and have ceased operations - as such, the ION GXT Reconnaissance Permit is considered to be defunct.

FF 28

is potentially another application that would overlap the same area, but for which a Reconnaissance Application has not been submitted.

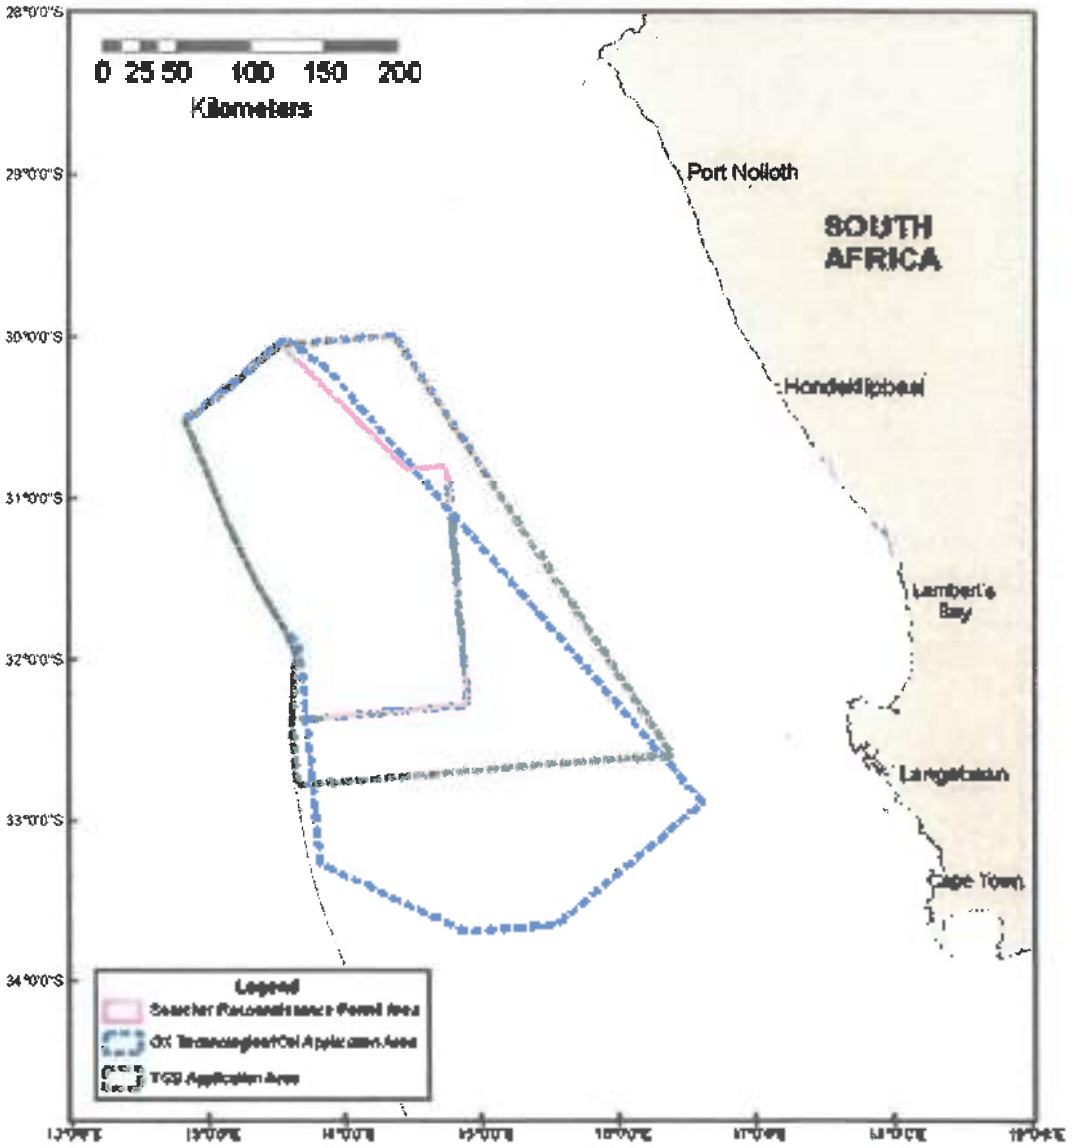

Figure 117: Application Areas for cumulative assessment in the unlikely event of multiple simultaneous surveys.

Despite the difficulty in undertaking a reliable assessment of the potential cumulative environmental impacts of future seismic acquisition in the Deep Water Orange Basin due to likely variation in the scope, extent and duration of proposed surveys, the cumulative impacts of three potential surveys occurring concurrently needs to be considered. The cumulative assessment assumes the worst-case scenario of three surveys (Searcher, TGS and GX Technologies) occurring simultaneously during the summer survey window in 2022/23.

In the unlikely event that multiple surveys would be undertaken concurrently within the Deep Water Orange Basin Area, associated impacts to marine fauna would be of high intensity and extend regionally, over the short-term (assuming they take place over the same summer survey window). The impact consequence for cumulative surveys is therefore considered medium.

Concurrent activities such as other planned speculative or proprietary seismic surveys in the southern Benguela region could add to the cumulative impact on fisheries. Simultaneous survey operations would result in an increase in the extent and magnitude of the impact on the large pelagic longline sector. The impact duration would remain unchanged. Three seismic surveys of regional extent, undertaken simultaneously, could be

expected to result in an impact of medium negative significance on the large pelagic longline sector, both with and without the application of mitigation measures. Once completed there is not expected to be any residual impact.

Impact	Phase	Pre-mitigation ER	Post-mitigation ER	Final Significance
Cumulative impacts on marine fauna and fisheries	Operation	Medium	Low	Low
Mitigation Measures				
In the unlikely event that multiple surveys would take place at the same time within the same survey area, the risk of cumulative noise impact must be considered and is suggested to be managed as follows: • Should surveys be run simultaneously, ensure that a distance of at least 40 km is maintained between survey vessels until sufficient objective evidence is obtained that a reduced buffer distance is acceptable. • Each of the additional activities to those described in the technical noise report would be modelled or otherwise considered in terms of the cumulative noise level and with reference to the criteria described in the report. This modelling is only considered required in the case where a 40 km buffer distance between active survey ships cannot be maintained. • Should surveys run simultaneously, it would be required to amend the EMPr, which would be subject to further assessment and consultation.				

9.3.6 NO-GO ALTERNATIVE

The no go alternative would imply that no survey activities are undertaken and, as such, the negative impacts as stated above, would not materialise. However, conversely, this will negate the potential positive impacts associated with the proposed survey activities, including:

- The opportunity to identify potential oil and gas resources within the Application Area including potential future contribution to the economy of South Africa;
- The opportunity to conduct independent research on how fish species on the West Coast such as snoek respond to seismic surveying; and
- Provision of job or training opportunities (very limited during the survey phase).

Since there are no mitigation measures, the impact significance will be low pre- and post-mitigation and final significance will be the same.

Impact	Phase	Pre-mitigation ER	Post-mitigation ER	Final Significance
No-Go Alternative	Operation	Low	Low	Low
Mitigation Measures				
• N/A				

10 CLOSURE AND REHABILITATION

It is anticipated that the activities will have a limited impact on the receiving environment. The impacts will be limited to the planning and operational phases and it is not anticipated that there will be any need for closure or rehabilitation once the 3D surveys have been concluded. As such, closure of the project will be limited to the conclusion of the physical 3D surveys to be undertaken in the target area. This will mainly relate to:

- Waste generation and disposal; and
- Water contamination and pollution.

Residual impacts post completion of the seismic activities are limited (if any) and therefore there will be no requirements for closure, decommissioning and rehabilitation actions. The overall closure objective will be to ensure that the post closure environment aligns with the pre-development. Therefore, no financial provisions apply to this application. A Rehabilitation, Decommissioning and Closure Plan is included as Appendix 6.

11 CONCLUSIONS AND RECOMMENDATIONS

The BA process identified potential issues and impacts associated with the proposed project. The BA addresses those identified potential environmental impacts and benefits (direct, indirect and cumulative impacts) associated with applicable phases of the project and recommends appropriate mitigation measures for potentially significant environmental impacts. The BA report provides sufficient information regarding the potential impacts and the acceptability of these impacts in order for the Competent Authority to make an informed decision regarding the proposed project. The release of a draft BA Report provides stakeholders with an opportunity to verify that the issues they have raised through the process had been captured and adequately considered.

The BA report aims to achieve the following:

- Provide an overall description of the social and biophysical environments affected by the proposed project.
- Assess potentially significant impacts (direct, indirect and cumulative, where required) associated with the proposed project.
- Identify and recommend appropriate mitigation measures for potentially significant environmental impacts; and
- Undertake a fully inclusive public involvement process to ensure that I&APs are afforded the opportunity to participate, and that their issues and concerns are recorded.

11.1 CONCLUSIONS FROM SPECIALIST STUDIES

The conclusions and recommendations of this BA are the result of the assessment of identified impacts by specialists, and the parallel process of public participation. The public consultation process has been extensive, and every effort has been made to include representatives of all stakeholders in the study area. The main conclusions from each of the specialist studies are presented below.

11.1.1 NOISE / ACOUSTICS

The zones of potential injuries for fish species with a swim bladder, turtles and fish eggs and fish larvae are predicted to be within 180 m from the array source. However, fish species without swim bladders have higher injury impact thresholds, and therefore have smaller zones of potential injuries within 90 m from the airgun array source.

The zones of potential mortal injuries for fish species with a swim bladder, fish eggs, and fish larvae are predicted to be within 30 m from the adjacent survey lines for all the 24-hour survey operation scenarios considered. For recoverable injury, the zones of impact are predicted to be within 80 m from the adjacent survey lines for fish with a swim bladder for all the operation scenarios considered. Fish without swim bladder are not expected to suffer or any potential injury. The zones of TTS effect for fish species with and without swim bladders are predicted to be within 2.9 km from the adjacent survey lines for the relevant 24-hour survey operation scenarios considered. Existing experimental data regarding recoverable injury and TTS impacts for fish eggs and larvae is sparse and no guideline recommendations have been provided. However, based on a subjective approach, noise impacts are expected to be moderate for fish eggs and larvae. Impact is expected to be low for all of them at intermediate and far field from the source location.

Three (3) long range modelling source locations are proposed for the 3D seismic survey. The modelling is representative of the noise propagation within the proposed 3D seismic area. Source location L1 is adjacent to the marine sensitive area. L2 represents the average depth of the south survey area and L3 is located towards the deeper water environment of the survey area. As can be seen from the horizontal and vertical contour figures, the received noise levels at far-field locations vary at different angles and distances from the source locations. This directivity of received levels is due to a combination of the directivity of the source array, and propagation effects caused by bathymetry and sound speed profile variations.

In general, the bathymetry profiles with significant upslope section across the continental slope region have the sound propagations experiencing significant attenuation due to the strong interaction between the sound signal and the seabed. The bathymetry profiles with downslope section have much less sound attenuation. These effects are evident in all locations for propagation paths towards shoreline directions.

For all source locations and except for downslope sections, the seabed depth variations are not significant along the propagation paths within the deep-water region. Therefore, the directivity of received noise is dominated by the directionality of the source array.

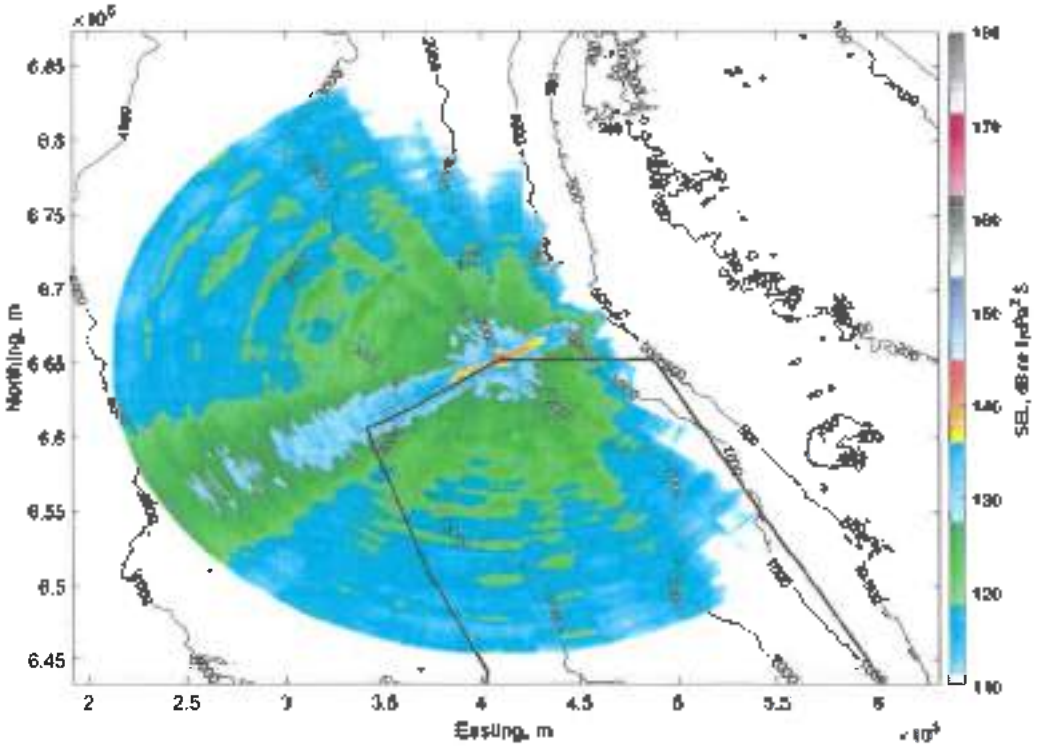

Figure 118: Modelled horizontal contour image of the predicted maximum SEL (unweighted and maximum level across water column) contours for source location L1 to a maximum range of 200 km, overlayed with bathymetry contour lines. Coordinates in WGS 84/UTM Zone 33S.

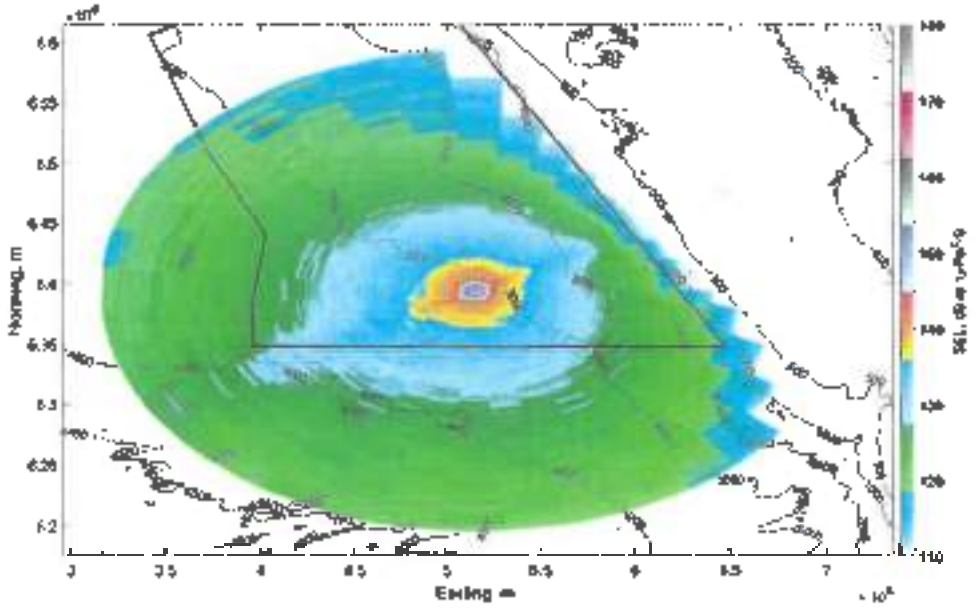

Figure 119: Modelled horizontal contour image of the predicted maximum SEL (unweighted and maximum level across water column) contours for source location L2 to a maximum range of 200 km, overlayed with bathymetry contour lines. Coordinates in WGS 84/UTM Zone 33S.

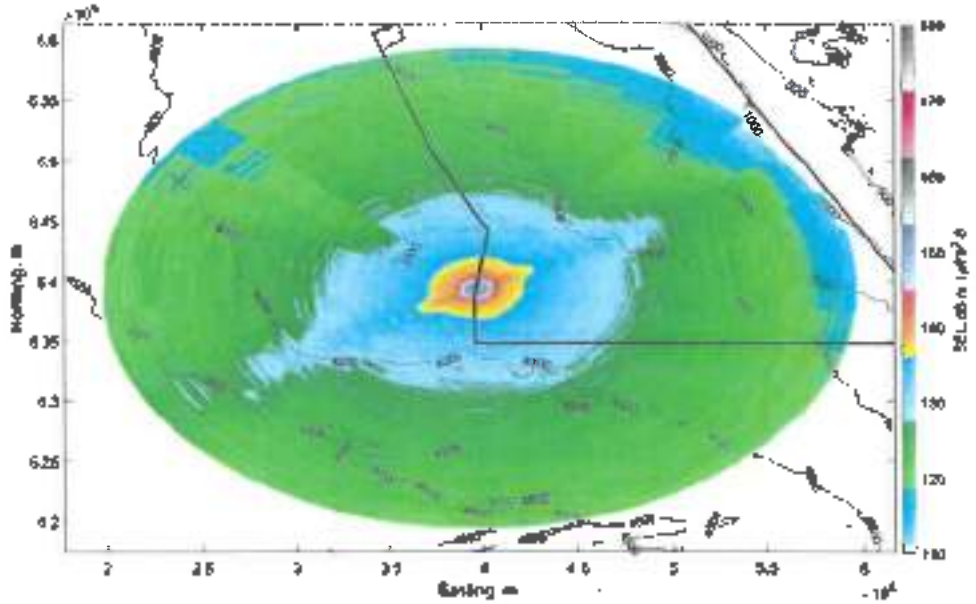

Figure 120: Modelled horizontal contour image of the predicted maximum SEL (unweighted and maximum level across water column) contours for source location L3 to a maximum range of 200 km, overlayed with bathymetry contour lines. Coordinates in WGS 84/UTM Zone 33S.

In terms of the impact from immediate exposure to individual airgun array pulses, the maximum zones of PTS effect for sea turtles are predicted to be within 19 m from the source location. On the other hand, the maximum zones of TTS effect for sea turtles are predicted to be within 24 m of the source array. The behavioural disturbance for sea turtles caused by the immediate exposure to individual pulses are predicted to be within 1.3 km of the source array.

In terms of the impact from cumulative exposure to multiple airgun array pulses, the noise impacts related to recoverable injury and TTS on sea turtles are expected to be high at the near field from the source location. The

maximum zones of PTS impact are predicted to range within 10 m of the source array. The maximum zones of TTS effect for sea turtles are predicted to be within 500 m of the source array. Further work will include the recommendation of underwater noise mitigation measures from seismic survey activities related to zones of impact and implementation of soft-starts if required.

Relevant mitigation measures are recommended to minimise the seismic impact on assessed marine fauna species:

- Recommended safety zones are based on the maximum threshold distances modelled for PTS (marine mammals and sea turtles) and potential mortal injury (fish) due to immediate exposure from single pulses and cumulative exposure from multiple pulses.
- Implement a soft-start procedure if testing multiple seismic sources. Delay soft-starts if shoaling large pelagic fish, turtles, seals, or cetaceans are observed within the zone of impact.
- Baseline noise measurements can provide useful information (prior to operations) when interpreting underwater noise predictions for the introduction of a new noise source. As such, it is recommended that underwater noise measurements be implemented that would include the deployment of underwater sound monitoring equipment to establish an actual baseline prior to the commencement of the survey and then operational levels of noise during the survey.

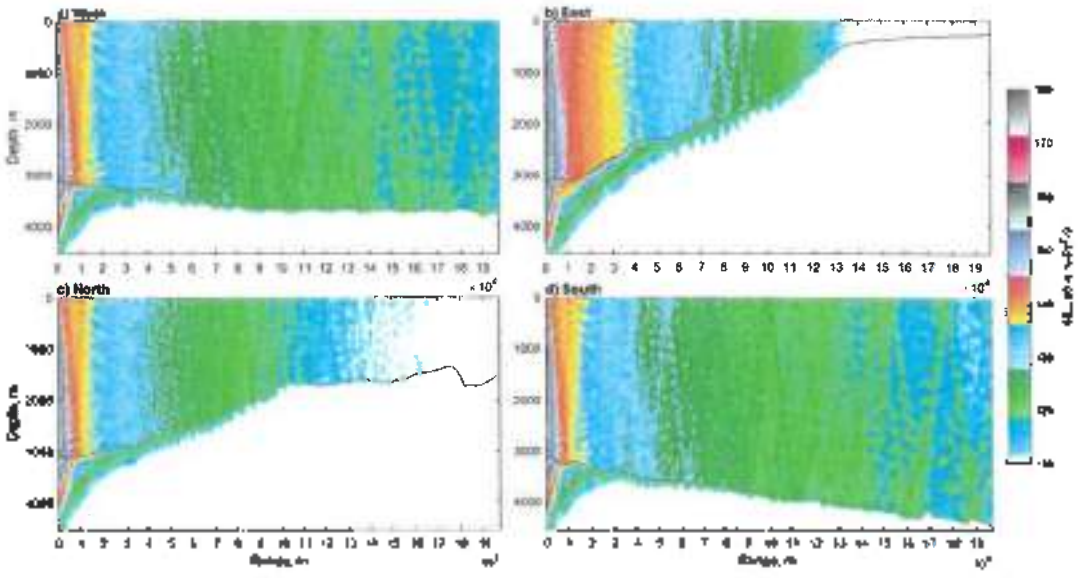

Figure 121: Modelled vertical contour images of the predicted SELs (unweighted) vs range and depth along the propagation path towards a) west b) east c) north and d) south direction from the source location L1. Black line shows the seabed depth.

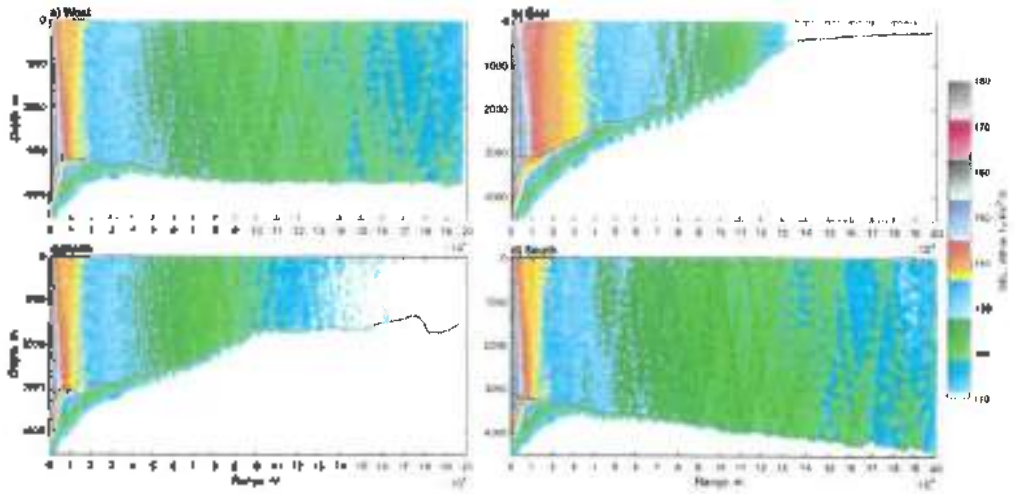

Figure 122: Modelled vertical contour images of the predicted SEL (unweighted) vs range and depth along the propagation path towards a) west b) east c) north and d) south direction from the source location L2. Black line shows the seabed depth.

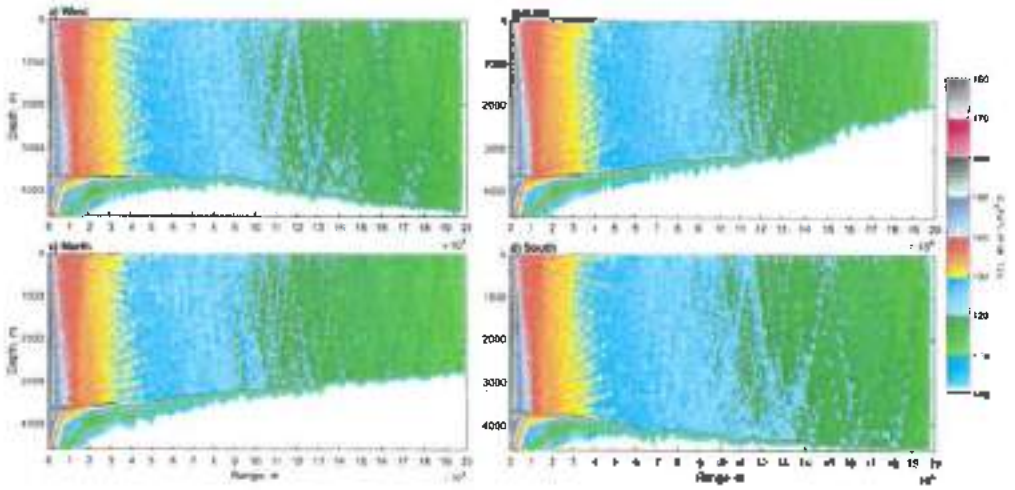

Figure 123: Modelled vertical contour images of the predicted SEL (unweighted) vs range and depth along the propagation path towards a) west b) east c) north and d) south direction from the source location L3. Black line shows the seabed depth.

In the unlikely event that up to three multiple surveys would take place at the same time within the same survey area, the risk of cumulative noise impact must be considered and is suggested to be managed as follows:

- During seismic pulse releases, maintain a distance of at least 40 kilometres from any other survey vessel until sufficient objective evidence is obtained that a reduced buffer distance is acceptable; and
- Each of the additional activities to that described in the technical noise report would be modelled or otherwise considered in terms of the cumulative noise level and with reference to the criteria described in this report (the modelling is only considered required in the case where a 40 km buffer distance between active survey ships cannot be maintained).

This 40km buffer maintained by any other survey vessels is considered sufficient on the basis that it provides a corridor between vessels where seismic source noise approaches ambient levels such that animals may pass between, and/or the potential cumulative effect beyond this distance is considered to be negligible.

11.1.2 MARINE ECOLOGY

The proposed survey activities to be undertaken by TGS are expected to result in impacts on marine invertebrate fauna in the Orange Basin, ranging from negligible to very low significance. Only in the case of potential impacts to turtles and marine mammals are impacts of low significance expected.

If all environmental guidelines, and appropriate mitigation measures recommended in this report are implemented, there is no reason why the proposed seismic survey programme should not proceed. It should also be kept in mind that some of the migratory species are now present year-round off the West Coast, and that certain baleen and toothed whales are resident and/or show seasonality opposite to the majority of the baleen whales. Data collected by independent onboard observers should form part of a survey close-out report to be forwarded to the necessary authorities, and any incidence data and seismic source output data arising from surveys should be made available for analyses of survey impacts in Southern African waters.

11.1.3 FISHERIES ASSESSMENT

The potential impacts of the seismic survey programme on fisheries relate to 1) exclusion of fishing vessels from accessing fishing ground, 2) the impact on catch rates as a result of increased noise levels associated with the seismic survey operation, 3) accidental loss of equipment from the survey array and 4) accidental release of marine diesel at sea.

Under the Convention on the International Regulations for Preventing Collisions at Sea (COLREGS, 1972, Part A, Rule 10), a seismic survey vessel that is engaged in surveying is defined as a "vessel restricted in its ability to manoeuvre" which requires that power-driven and sailing vessels give way to a vessel restricted in her ability to manoeuvre. Furthermore, under the Marine Traffic Act, 1981 (No. 2 of 1981), a vessel used for the purpose of exploiting the seabed falls under the definition of an "offshore installation" and as such it is protected by a 500 m safety zone. It is an offence for an unauthorised vessel to enter the safety zone. In addition to a statutory 500 m safety zone, a seismic contractor would request a safe operational limit (that is greater than the 500 m safety zone) that it would like other vessels to stay beyond. Safety clearances for seismic surveys are usually 6 Nm ahead and astern and 2 Nm to either side of the survey vessel, resulting in an exclusion area of approximately 185 km^2 around the survey vessel. The temporary exclusion of fisheries from the safety zone may reduce access to fishing grounds, which in turn could potentially result in a loss of catch and/or displacement of fishing effort (direct negative impact). The safety zone would be implemented around the seismic vessel for the duration of the project, resulting in an immediate impact that would endure for the duration of the proposed survey (~70 days). The impact of exclusion from fishing ground was assessed on each fishing sector based on the type of gear used and the proximity of fishing areas relative to the Reconnaissance Permit area. With the implementation of the project controls and mitigation measures, the residual impact of the proposed survey is considered to be of LOW NEGATIVE significance to large pelagic longline and tuna pole-line sectors. There is no impact expected on the demersal trawl, midwater trawl, demersal longline, small pelagic purse-seine, linefish, west coast rock lobster, netfish and small-scale fishing sectors.

The impact on catch rates due to sound elevation levels was assessed and sensitivity/vulnerability differences amongst the targeted fish species identified for each sector. Sound generated during the proposed seismic survey is expected to be in the order of 255 dB re 1 µPa at 1 m at an operating frequency range of 5 – 300 Hz. This falls within the hearing range of most fish species. A sound transmission loss modelling study (SLR 2022) identified predicted zones of impact for fish species (amongst other marine fauna species of concern) based on relevant noise impact assessment criteria. The noise effects assessed included physiological effects (physical injury/permanent threshold shift (PTS) and temporary threshold shift (TTS)) and behavioural disturbance due to either immediate impact from single airgun pulses or cumulative effects of exposure to multiple airgun pulses over a period of 24 hours. Based on the current project description, sound levels for the seismic survey could notionally be expected to attenuate to below levels for behavioural disturbance at a distance of 4 km from the source. The spatial extent of the impact of sound (produced by the airgun array) on catch rates is expected to be regional, although localised at any one time. The impact is considered to be of immediate duration and reversible without additional time or cost. Based on the distance of fishing grounds from the Reconnaissance Permit area, only the large pelagic longline and tuna pole-line sectors are considered to be susceptible to the

effects of elevated sound. With the implementation of the project controls and mitigation measures, the residual impact due to seismic noise is considered to be of LOW NEGATIVE significance. There is no impact expected on the demersal trawl, midwater trawl, demersal longline, small pelagic purse-seine, linefish, west coast rock lobster, netfish and small-scale fishing sectors.

The Reconnaissance Permit area is situated in the Orange Basin, offshore of the shelf break and offshore of grounds of importance for many of South Africa's commercial fishing sectors, as well as small-scale and recreational fisheries. The large pelagic longline sector operates across the extent of the Reconnaissance Permit area, with activity focussed along the continental shelf break. The Application Area does not overlap key spawning or nursery areas therefore the risk of noise disturbance to spawning behaviour and fishery recruitment is considered unlikely.

In order to mitigate the impacts on the large pelagic longline sector, it is recommended that the survey avoid taking place during June and July. Prior to the commencement of survey activities, affected parties should be informed of the navigational co-ordinates of the proposed survey acquisition area, timing and duration of proposed activities and any implications relating to the safety zone that would be requested, as well as the movements of support vessels related to the project. The relevant fishing associations include FishSA, SA Tuna Association, SA Tuna Longline Association and Fresh Tuna Exporters Association.

Other key stakeholders should be notified prior to commencement and on completion of the survey. These include; DFFE, the South African Navy Hydrographic Office (SANHO), South African Maritime Safety Association (SAMSA) and Ports Authorities. For the duration of the survey, a navigational warning should be broadcast to all vessels via Navigational Telex (Navtex) and Cape Town radio. In addition, it is recommended that updates of the scheduled weekly survey plan should be circulated to the operators of affected fishing vessels on a daily basis. A Fisheries Liaison Officer (FLO) should be present on board the seismic vessel or escort vessel for the duration of the survey in order to facilitate communications between the seismic and fishing vessels in the project area.

It is the reasoned opinion of the specialist that the reconnaissance activities may be authorised, subject to the implementation of the mitigation measures proposed.

11.1.4 HERITAGE ASSESSMENT

The scientific studies conducted for this project identified impacts on fishing stock as low for all species. By inference, a potential impact on fishing yield could be expected and thus potential economic impact on communities due to reduced caught fish volumes. The recommended mitigation measures, as listed in the specialist reports for the project, focus on the reduction of impacts on fish species and the projected reduction of the impact on the commercial and small-scale fishery catch yield. These mitigation measures should then indirectly positively impact the potential negative impacts on the cultural heritage of the communities to be impacted.

A pre-mitigation negative impact on a regional scale over the long term with a moderate intensity is predicted due to the potential indirect impact on the communities and, ultimately, their heritage, with a high probability of this impact occurring. The pre-mitigation impact on heritage resources is rated as MEDIUM. The potential residual impact on heritage resources, with mitigation measures from the scientific studies, is projected as LOW with a medium confidence factor.

Considering the assessment based on the findings of the fieldwork as well as the scientific studies relating to the impact on fisheries, the specialist is of the opinion that the impact of the proposed project on the cultural heritage resources can be mitigated through the implementation of the recommendations in this report.

11.1.5 SOCIAL ASSESSMENT

TGS's activities for this application would be of short duration if approved, and if viewed in isolation considering only technical risks as discussed in various specialist reports conducted as part of the EIA process, the impacts will be negligible. However, communities feel that there are significant gaps in the available data and from a social perspective the non-technical or social risks can potentially cause significant impacts. Although the marine fauna and fisheries specialists have indicated that the impacts on the marine fauna would be negligible, the

communities, with generations of experience in the ocean, fear that the behaviour of the fish will change and that this would affect their catch rates and consequently their livelihoods. What is seen as a minor impact in a large eco-system may be experienced as a major impact by an individual. The marine fauna might not be affected greatly, but the fishing community fear that marine fauna might change its behaviour in response and that is a main concern from a social perspective.

Another concern is the cumulative impact of activities in the ocean where these communities earn their livelihoods. Their fears about the tipping point where their source of livelihood does not recover from all the activities in the ocean, and they are no longer able to make their livelihood as fishing communities must be considered. Currently these communities are able to sustain themselves, although it is difficult. The communities are not against development, but they want to see it happen in a sustainable way that does not jeopardise their source of livelihood. They have already seen how their livelihoods are being affected by mining that is taking place in the sea, pollution, climate change, overfishing and businesses such as factories that come and go and often and do not leave in a socially responsible way.

TGS, as well as other companies that want to do surveys or exploration in the area, currently do not have social license to operate. A large part of this is due to a lack of meaningful consultation by previous applicants from a community perspective. If TGS or any other seismic survey company wants to proceed with the project, they will need to engage in meaningful conversation with the communities and try to restore relationships. From a community and social risk perspective this is not negotiable.

Seismic reconnaissance projects are controversial in South Africa and has been in the news frequently in the last year. For many stakeholders it is an emotional matter, for others the potential of impacting their livelihoods is the biggest fear. There are also stakeholders that feel that the exploration for fossil fuels is not in line with sustainable development and the fight against climate change. Other stakeholders feel that it is imperative for the growth and development of the South African economy to engage in these investigations.

From a social perspective it is clear that the communities and majority of local people are opposed to the project. If the project is considered in isolation, the impacts are negligible. However, the project does not happen in a vacuum, and the social environment is much wider than the footprint of the project. If the social risks and potential damage to cultural and indigenous rights are considered the impact on the social fabric of already vulnerable communities may be significant. At this stage communities feel that they cannot make informed decisions. Although all legal processes have been followed, the seismic survey industry is not moving at the pace of the community, and in the long run this will be detrimental to the industry. Potential future benefits and the economic development of the country should the surveys find any significant resources are not disputed. From a social perspective it is recommended that the project proceed subject to the mitigation measures (i.e. meaningful consultation, local research, education, and awareness raising in the project-affected communities) forming part of the conditions for authorisation and being implemented prior to the commencement of the actual survey.

11.2 PREFERRED ALTERNATIVES

The preferred alternatives are discussed below. The final Sensitivity Map is provided in Figure 124 below which shows all identified sensitive areas including the MPA 5km buffer zones. No no-go areas were identified within the Application Area itself. No layout or location alternatives are applicable so only technology alternatives are discussed below.

The activities proposed in this application require specialised technology and skills. The available technology alternatives are limited by most suitable technology for conducting seismic surveys. To this end, it was concluded by Weilgart (2010) that seismic source design can be optimized to reduce unwanted energy. Imaging deep geological targets requires an acoustic source outputting relatively low frequency content (200Hz) and in directions (both inline and horizontal to the plane of interest) that are not of use. During collection of seismic data for deep imaging purposes one should strive to reduce unnecessary acoustic energy (noise) through array, source, and receiver design optimization. Weilgart (2010) further concluded that that regardless of the imaging target, anyone collecting seismic data should strive to reduce unwanted energy or noise. It should be noted that even if unwanted frequencies (> 200 Hz) are removed, there will still be frequency overlap with several marine

animals (including most baleen whales) that can and should be minimized. It was further concluded that, lower source levels could be achieved through better system optimization, i.e. a better pairing of source and receiver characteristics, and better system gain(s). For example, new receiver technologies, such as fibre-optic receivers, may allow the use of lower amplitude sources through a higher receiver density and/or a lower system noise floor. Some evidence exists which indicates that re-engineered seismic sources with "mufflers" can be used to attenuate unwanted high frequency energy without affecting frequencies of interest.

The above optimisation techniques should be implemented including better seismic source design and system optimisation with the selected survey contractor. In addition, kerosene free hydro-streamers should be used. It is also important to ensure that 'turtle-friendly' tail buoys are used or that existing tail buoys are fitted with either exclusion or deflector 'turtle guards'.

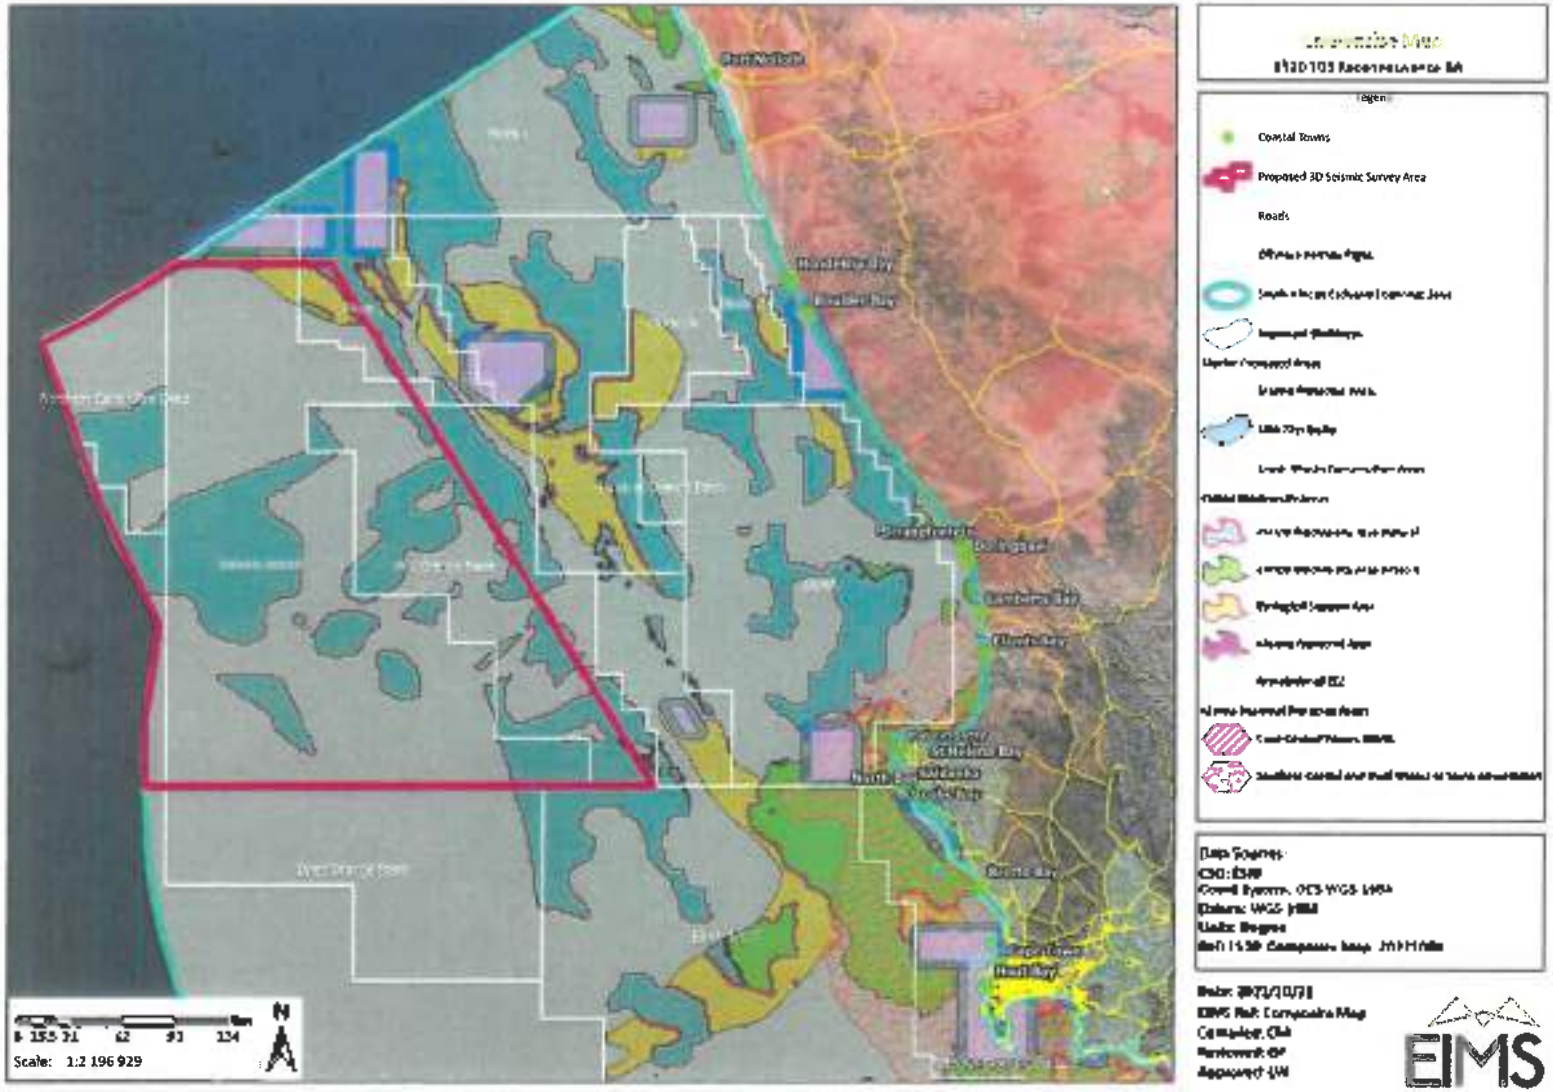

Figure 124: Final Composite Sensitivity Map

11.3 ENVIRONMENTAL IMPACT STATEMENT

The findings of the specialist studies conclude that there are no environmental fatal flaws that should prevent the proposed project from proceeding, provided that the recommended mitigation and management measures are implemented. Based on the nature and extent of the proposed project, the local level of disturbance predicted as a result of the reconnaissance activities, the findings of the specialist studies, and the understanding of the significance level of potential environmental impacts, it is the opinion of the EIA project team and the EAP that the significance levels of the majority of identified negative impacts can generally be reduced to an acceptable level by implementing the recommended mitigation measures and the project should be authorized. A sensitivity map is provided in Figure 124 above and a summary showing the number of impacts and the post-mitigation significance of these identified impacts is provided in Figure 125.

Based on the findings of the Acoustics, Marine Ecology and Fisheries recommendations, it is recommended that the survey window of January – May be utilised in order to:

- Avoid sensitive areas and periods for some marine fauna: Movement of migratory cetaceans (particularly baleen whales) from their southern feeding grounds into low latitude waters (June/July and late October/November), and their aggregation on the summer feeding grounds between St Helena Bay and Dassen Island from late October to late December and ensure that migration paths are not blocked by seismic operations;
- Avoid periods of peak fishing activity during June and July in order to reduce the probability of disruption to the large pelagic longline fishing sector and tuna pole line fishing sector.

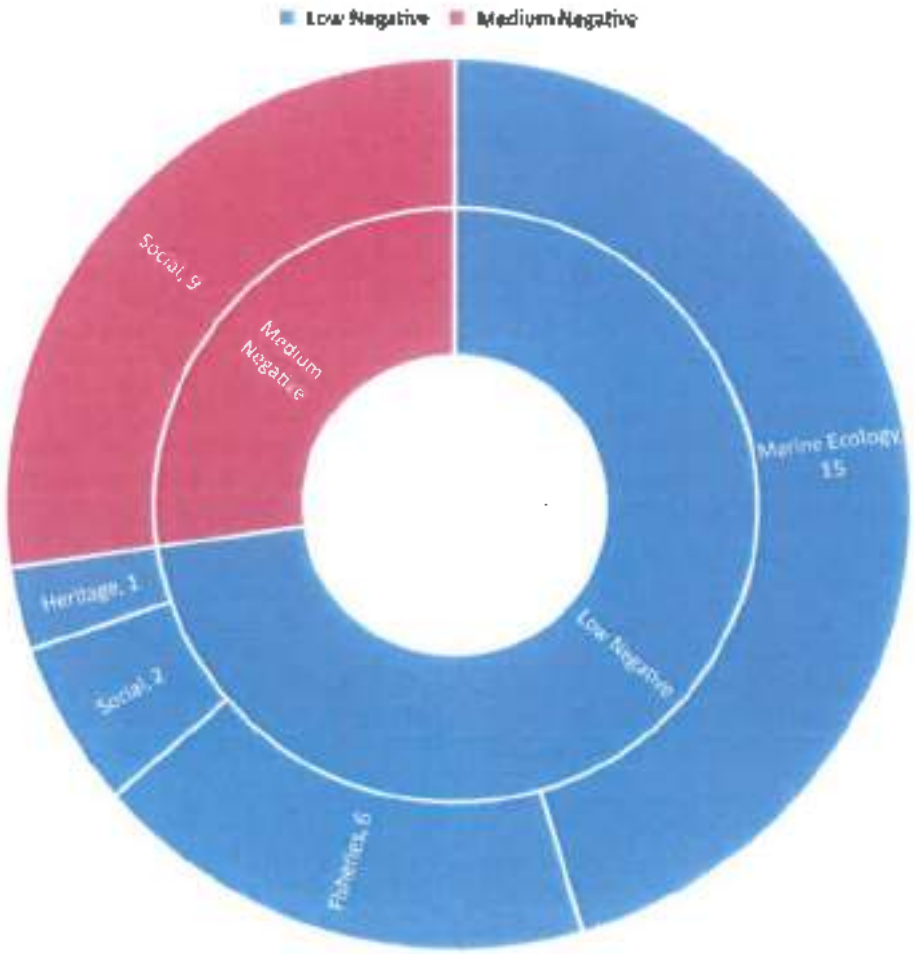

Figure 125: Impact Summary showing number and significance of impacts post mitigation

11.4 RECOMMENDATIONS FOR INCLUSION IN ENVIRONMENTAL AUTHORIZATION

This section contains recommendations from the various specialist studies for inclusion in the EA. It is recommended that these surveys and other drilling applications should be planned in such a way that the cumulative impacts would be minimised, and that the competent authority should carefully evaluate the cumulative impacts of this survey combined with other proposed seismic surveys in the same general area.

11.4.1 MARINE ECOLOGY

This section includes marine ecology recommendations for inclusion in the EA.

11.4.1.1 APPLICATION OF THE MITIGATION HIERARCHY

A key component of this EIA process is to explore practical ways of avoiding and where not possible to reducing potentially significant impacts of the proposed seismic acquisition activities. The mitigation measures put forward are aimed at preventing, minimising, or managing significant negative impacts to as low as reasonably practicable (ALARP). The mitigation measures are established through the consideration of legal requirements, project standards, best practice industry standards and specialist inputs.

The mitigation hierarchy, as specified in International Finance Corporation (IFC) Performance Standard 1, is based on a hierarchy of decisions and measures aimed at ensuring that wherever possible potential impacts are mitigated at source rather than mitigated through restoration after the impact has occurred. Any remaining significant residual impacts are then highlighted, and additional actions are proposed. With few exceptions, however, identified impacts were of low significance with very low or zero potential for further mitigation. In such cases the appropriate project Standards will be used and additional best management practices are proposed.

The operator will ensure that the proposed seismic survey is undertaken in a manner consistent with good international industry practice and in compliance with the applicable requirements in MARPOL 73/78, as summarised below.

- The discharge of biodegradable wastes from vessels is regulated by MARPOL 73/78 Annex V, which stipulates that:
    - No disposal to occur within 3 nautical miles (± 5.5 km) of the coast.
    - Disposal between 3 nautical miles (± 5.5 km) and 12 nautical miles (± 22 km) needs to be comminated to particle sizes smaller than 25 mm.
    - Disposal overboard without macerating can occur greater than 12 nautical miles from the coast when the vessel is sailing.
- Discharges of oily water (deck drainage, bilge and mud pit wash residue) to the marine environment are regulated by MARPOL 73/78 Annex I, which stipulates that vessels must have:
    - A Shipboard Oil Pollution Emergency Plan (SOPEP).
    - A valid International Oil Pollution Prevention Certificate, as required by vessel class.
    - Equipment for the control of oil discharge from machinery space bilges and oil fuel tanks, e.g. oil separating/filtering equipment and oil content meter. Oil in water concentration must be less than 15 ppm prior to discharge overboard.
    - Oil residue holding tanks.
    - Oil discharge monitoring and control system.
- Sewage and grey water discharges from vessels are regulated by MARPOL 73/78 Annex IV, which specifies the following:
    - Vessels must have a valid International Sewage Pollution Prevention Certificate.

- Vessels must have an onboard sewage treatment plant providing primary settling, chlorination and dichlorination before discharge of treated effluent.
- The discharge depth is variable, depending upon the draught of the seismic vessel / support vessel at the time, but will be in accordance with MARPOL 73/78 Annex IV.
- Discharge of sewage beyond 12 nm requires no treatment. However, sewage effluent must not produce visible floating solids in, nor cause the discolouration of, the surrounding water.
- Sewage must be comminuted and disinfected for discharges between 3 nautical miles (± 6 km) and 12 nautical miles (± 22 km) from the coast. This will require an onboard sewage treatment plant or a sewage comminuting and disinfecting system.
- Disposal of sewage originating from holding tanks must be discharged at a moderate rate while the ship is proceeding on route at a speed not less than 4 knots.

- Sewage will be treated using a marine sanitation device to produce an effluent with:
  - A biological oxygen demand (BOD) of <25 mg/l (if the treatment plant was installed after 1/1/2010) or <50 mg/l (if installed before this date).
  - Minimal residual chlorine concentration of 1.0 mg/l.
  - No visible floating solids or oil and grease.

The project will also comply with industry best practices regarding waste management, including:

- Waste management will follow key principles: Avoidance of Waste Generation, adopting the Waste Management Hierarchy (reduce, reuse, recycle, recover, residue disposal), and use of Best Available Technology (BAT).
- An inventory will be established of all the potential waste generated, clarifying its classification (hazardous, non-hazardous or inert) and quantity, as well as identifying the adequate treatment and disposal methods.
- Waste collection and temporary storage shall be designed to minimise the risk of escape to the environment (for example by particulates, infiltration, runoff or odours).
- On-site waste storage should be limited in time and volume.
- Dedicated, clearly labelled, containers (bins, skips, etc.) will be provided in quantities adapted to anticipated waste streams and removal frequency.

Detailed mitigation measures for seismic surveys in other parts of the world are provided by Weir *et al.* (2006), Compton *et al.* (2007) and US Department of Interior (2007). Many of the international guidelines presented in these documents are extremely conservative as they are designed for areas experiencing repeated, high intensity surveys and harbouring particularly sensitive species, or species with high conservation status. A number of countries have more recently updated their guidelines, most of which are based on the Joint Nature Conservation Committee - JNCC (2010, 2017) recommendations but adapted for specific areas of operation. The guidelines currently applied to seismic surveying in South African waters are those proposed in the Generic EMPr and by Purdon (2018). Purdon highlights the importance of developing mitigation guidelines both locally and regionally and points out that if South Africa is to maintain environmental integrity, mitigation guidelines for seismic surveys specific to the country, and based on the most recent scientific data, need to be implemented.

The mitigation measures proposed for seismic surveys are as provided below for each phase of a seismic survey operation:

11.4.1.2 MOBILISATION PHASE

11.4.1.2 1 PRE-SURVEY PLANNING

- Plan seismic surveys to avoid sensitive areas and periods for some marine fauna: Movement of migratory cetaceans (particularly baleen whales) from their southern feeding grounds into low latitude waters (June/July and late October/November), and their aggregation on the summer feeding grounds

between St Helena Bay and Dassen Island from late October to late December and ensure that migration paths are not blocked by seismic operations. If possible, the survey should be undertaken from North to South to avoid these feeding aggregations.

- Plan survey, as far as possible, so that the first commencement of seismic acquisition in a new area (including seismic source tests) are undertaken during daylight hours.
- Prohibit seismic source use (including tests) outside of the area of operation (which includes line turns undertaken outside the licence area).
- Although a seismic vessel and its gear may pass through a declared Marine Protected Area, acoustic sources (seismic sources) must not be operational during this transit.
- A 5 km buffer zone where no seismic source operation is permitted is recommended around all MPAs.

11.4.1.2.2 KEY EQUIPMENT

Passive Acoustic Monitoring

- Ensure the seismic vessel is fitted with PAM technology, which detects some animals through their vocalisations.
- As the Application Area would largely be in waters deeper than 1 000 m where sperm whales and other deep-diving odontocetes are likely to be encountered, implement the use of PAM 24-hr a day when the seismic source is in operation.
- Ensure that the PAM hydrophone streamer is towed in such a way that the interference of vessel noise is minimised.
- Ensure the PAM streamer is fitted with at least four hydrophones, of which two are HF and two LF, to allow directional detection of cetaceans.
- Ensure spare PAM hydrophone streamers are readily available in the event that PAM breaks down, in order to ensure timeous redeployment.

Infra Red Cameras

- MMOs are to be equipped with infra-red cameras in order to observe mammals at night.

Seismic Source

- Define and enforce the use of the lowest practicable seismic source volume for production, and design arrays to maximise downward propagation, minimise horizontal propagation and minimise high frequencies in seismic source pulses.
- Ensure a display screen for the seismic source operations is provided to the marine observers. All information relating to the activation of the acoustic source and the power output levels must be readily available to support the observers in real time via the display screen and to ensure that operational capacity is not exceeded.
- Ensure the ramp-up noise volumes do not exceed the production volume.

Streamers

- Ensure that 'turtle-friendly' tail buoys are used by the survey contractor or that existing tail buoys are fitted with either exclusion or deflector 'turtle guards'.
- Ensure that solid streamers rather than fluid-filled streamers are used to avoid leaks.

528

11.4.1.2.3 KEY PERSONELL

- Make provision for the placing of qualified MMOs on board the seismic vessel. As a minimum, sufficient MMOs must be on watch to cover all hours for the pre-acquisition observations and when the acoustic source is active.
- The duties of the MMO would be to:
  - Provide effective regular briefings to crew members, and establish clear lines of communication and procedures for onboard operations;
  - Record seismic source activities, including sound levels, "soft-start" procedures and pre-start regimes;
  - Observe and record responses of marine fauna to seismic source from optimum vantage points, including seabird, large pelagic fish (e.g. shoaling tuna, sunfish, sharks), turtle, seal and cetacean incidence and behaviour and any mortality or injuries of marine fauna as a result of the seismic survey. Data captured should include species identification, position (latitude/longitude), distance/bearing from the vessel, swimming speed and direction (if applicable) and any obvious changes in behaviour (e.g. startle responses or changes in surfacing/diving frequencies, breathing patterns) as a result of the seismic activities. Both the identification and the behaviour of the animals must be recorded accurately along with current seismic sound levels. Any attraction of predatory seabirds, large pelagic fish or cetaceans (by mass disorientation or stunning of fish as a result of seismic survey activities) and incidents of feeding behaviour among the hydrophone streamers should also be recorded;
  - Sightings of any injured or dead protected species (marine mammals, large pelagic fish (e.g. sharks), seabirds and sea turtles) should be recorded regardless of whether the injury or death was caused by the seismic vessel itself. If the injury or death was caused by a collision with the seismic vessel, the date and location (latitude/longitude) of the strike, and the species identification or a description of the animal should be recorded and included as part of the daily report;
  - Record meteorological conditions at the beginning and end of the observation period, and whenever the weather conditions change significantly;
  - Request the delay of start-up or temporary termination of the seismic survey or adjusting of seismic source, as appropriate. It is important that MMO decisions on the termination of seismic source is made confidently and expediently, and following dialogue between the observers on duty at the time. A log of all termination decisions must be kept (for inclusion in both daily and "close-out" reports);
  - Use a recording spreadsheet in order to record all the above observations and decisions; and
  - Prepare daily reports of all observations, to be forwarded to the necessary authorities as required, in order to ensure compliance with the mitigation measures.
- Make provision for placing of a qualified PAM operator on board the seismic vessel. As a minimum, one must be on "watch" during the pre-acquisition observations and when the acoustic source is active.
- Ensure MMOs and PAM operators are briefed on the area-specific sensitivities and on the seismic survey planning (including roles and responsibilities, and lines of communication).
- Seabird, turtle and marine mammal incidence data and seismic source output data arising from surveys should be made available on request to the Marine Mammal Institute, DFFE, and the Petroleum Agency South Africa for analyses of survey impacts in local waters.
- The duties of the PAM operator would be to:

- Provide effective regular briefings to crew members, and establish clear lines of communication and procedures for onboard operations;
- Ensure that the hydrophone cable is optimally placed, deployed and tested for acoustic detections of marine mammals;
- Confirm that there is no marine mammal activity within 500 m of the seismic source array prior to commencing with the "soft-start" procedures;
- Record species identification, position (latitude/longitude), distance and bearing from the vessel and acoustic source, where possible;
- Record general environmental conditions;
- Record seismic source activities, including sound levels, "soft-start" procedures and pre-start regimes; and
- Request the delay of start-up and temporary termination of the seismic survey, as appropriate.

11.4.1.3 OPERATIONAL PHASE

11.4.1.3.1 SEISMIC SOURCE TESTING

- Maintain a pre-acquisition watch of 60-minutes before any instances of seismic source testing. If only a single lowest power seismic source is tested, the pre- acquisition watch period can be reduced to 30 minutes.
- Consideration is to be given to the practicality (considering the weather conditions and costs) of aerial surveys to locate feeding aggregations. The use of drones could be considered (considering the weather conditions and costs) to supplement the observations of the MMO prior to soft starts.
- Implement a "soft-start" procedure if testing multiple seismic sources.
  - The "soft-start" should be carried out over a time period proportional to the number of seismic sources being tested and not exceed 20 minutes; seismic sources should be tested in order of increasing volume;
  - If testing all seismic sources at the same time, a 20 minute "soft-start" is required;
  - If testing a single lowest power seismic source a "soft-start" is not required.

11.4.1.3.2 PRE-START PROTOCOLS

- Implement a dedicated MMO and PAM pre- acquisition watch of at least 60 minutes (to accommodate deep-diving species in water depths greater than 200 m).
- Implement a "soft-start" procedure of a minimum of 20 minutes' duration on initiation of the seismic source if:
- during all hours it is confirmed:
  a) visually by the MMO during the pre- acquisition watch (60 minutes) that there are no penguins or feeding aggregations of diving seabirds, shoaling large pelagic fish, turtles, seals or cetaceans within 500 m of the seismic source, and
  b) by PAM technology that there are no vocalising cetaceans detected in the 500 m mitigation zone.
- During times of poor visibility or darkness it is confirmed by PAM technology that no vocalising cetaceans are present in the 500 m mitigation zone during the pre- acquisition watch (60 minutes).
- Delay "soft-starts" if penguins or feeding aggregations of diving seabirds, shoaling large pelagic fish, turtles, seals or cetaceans are observed within the mitigation zone.

- A "soft-start" should not begin until 30 minutes after cetaceans depart the 500 m mitigation zone or 30 minutes after they are last seen or acoustically detected by PAM in the mitigation zone.
- In the case of penguins, diving seabirds, shoaling large pelagic fish and turtles, delay the "soft-start" until animals are outside the 500 m mitigation zone.
- In the case of fur seals, which may occur commonly around the vessel, delay "soft-starts" for at least 10 minutes until it has been confirmed that the mitigation zone is clear of all seal activity. However, if after a period of 10 mins seals are still observed within 500 m of the seismic source, the normal "soft-start" procedure should be allowed to commence for at least a 20-minute duration. Seal activity should be carefully monitored during "soft-starts" to determine if they display any obvious negative responses to the seismic source and gear or if there are any signs of injury or mortality as a direct result of the seismic activities.

- As noted above for planning, when arriving at the survey area for the first time, survey activities should, as far as possible, only commence during daylight hours with good visibility. However, if this is not possible due to prolonged periods of poor visibility (e.g. thick fog) or unforeseen technical issue which results in a night-time start, the initial acoustic source activation (including seismic source tests) may only be undertaken if the normal 60-minute PAM pre-watch and "soft-start" procedures have been followed.
- Schedule "soft-starts" so as to minimise, as far as possible, the interval between reaching full power operation and commencing a survey line. The period between the end of the soft start and commencing with a survey line must not exceed 20 minutes. If it does exceed 20 minutes, refer to breaks in acquisition below.

11.4.1.3.3 LINE TURNS

- If line changes are expected to take longer than 40 minutes :
  - Terminate seismic source at the end of the survey line and implement a pre- acquisition search (60 minutes) and "soft-start" procedure (20 minutes) when approaching the next survey line.
  - If line turn is shorter than 80 minutes (i.e. shorter than a 60-minute pre- acquisition watch and 20-minute "soft-start" combined), the pre- acquisition watch can commence before the end of the previous survey line.
- If line changes are expected to take less than 40 minutes, seismic acquisition can continue during the line change if:
  - The power is reduced to 160 cubic inches (or as close as is practically feasible) at standard pressure. Seismic source volumes of less than 160 cubic inches can continue to discharge at their operational volume and pressure;
  - The Seismic Pulse Interval (SPI) is increased to provide a longer duration between pulses, with the SPI not to exceed 5 minutes; and
  - The power is increased and the SPI is decreased in uniform stages during the final 10 minutes of the line change (or geophone repositioning), prior to data collection re-commencing (i.e. a form of mini soft start).
  - Normal MMO and PAM observations continue during this period when reduced power seismic source is active.

11.4.1.3.4 SHUT-DOWNS

- Terminate seismic source on observation and/or detection of penguins or feeding aggregations of diving seabirds, turtles, slow swimming large pelagic fish (including whale sharks, basking sharks, manta rays) or cetaceans within the 500 m mitigation zone.

- Terminate seismic source on observation of any obvious mortality or injuries to cetaceans, turtles, seals or mass mortalities of squid and fish (specifically large shoals of tuna or surface shoaling small pelagic species such as sardine, anchovy and mackerel) when estimated by the MMO to be as a direct result of the survey.
- Depending the species, specific mitigation will be implemented to continue the survey operations, as specified below:
    - For specific species such as turtles, penguins, diving seabirds and slow swimming large pelagic fish (including whale sharks, basking sharks, manta rays), terminate source until such time as the animals are outside of the 500 m mitigation zone (seismic "pause", no soft-start required).
    - For cetaceans, terminate source until such time as there has been a 30-minute delay from the time the animal was last sighted within the mitigation zone before the commencement of the normal soft start procedure.

11.4.1.3.5 BREAKS IN SEISMIC SOURCE

- If after breaks in seismic acquisition, the seismic source can be restarted within 5 minutes, no soft-start is required and acquisition can recommence at the same power level provided no marine mammals have been observed or detected in the mitigation zone during the break-down period.
- For all breaks in seismic source of longer than 5 minutes, but less than 20 minutes, implement a "soft-start" of similar duration, assuming there is continuous observation by the MMO and PAM operator during the break.
- For all breaks in seismic source of 20 minutes or longer, implement a 60-minute pre- acquisition watch and 20-minute "soft-start" procedure prior to the survey operation continuing.
- For planned breaks, ensure that there is good communication between the seismic contractor and MMOs and PAM operators in order for all parties to be aware of these breaks and that early commencement of pre-watch periods can be implemented to limit delays.

11.4.1.3.6 PAM MALFUNCTIONS

- If the PAM system malfunctions or becomes damaged during night-time operations or periods of low visibility, continue operations for 30 minutes without PAM if no marine mammals were detected by PAM in the mitigation zones in the previous 2 hours, while the PAM operator diagnoses the issue. If after 30 minutes the diagnosis indicates that the PAM gear must be repaired to solve the problem, reduce power to 160 cubic inches. The reduced seismic source may continue for 30 minutes while PAM is being repaired, the last 10-minute of which is a 10-minute ramp up to full power (mini "soft-start"). If the PAM repair will take longer than 60 minutes, stop surveying until such time as a functional PAM system can be redeployed and tested.
- If the PAM system breaks down during daylight hours, continue operations for 20 minutes without PAM, while the PAM operator diagnoses the issue. If the diagnosis indicates that the PAM gear must be repaired to solve the problem, operations may continue for an additional 2 hours without PAM monitoring as long as:
    - No marine mammals were detected by PAM in the mitigation zones in the previous 2 hours;
    - Two MMOs maintain watch at all times during operations when PAM is not operational;
    - The time and location in which operations began and stop without an active PAM system is recorded.

11.4.1.4 VESSEL AND AIRCRAFT OPERATIONS

- Pre-plan flight paths to ensure that no flying occurs over seabird and seal colonies and offshore islands by at least 1 852 m (i.e. 1 nm);

- Avoid extensive low-altitude coastal flights by ensuring that the flight path is perpendicular to the coast, as far as possible;
- Brief all pilots on the ecological risks associated with flying at a low level along the coast or above marine mammals;
- The lighting on the survey and support vessels should be reduced to a minimum compatible with safe operations whenever and wherever possible. Light sources should, if possible and consistent with safe working practices, be positioned in places where emissions to the surrounding environment can be minimised;
- Keep disorientated, but otherwise unharmed, seabirds in dark containers for subsequent release during daylight hours. Ringed/banded birds should be reported to the appropriate ringing/banding scheme (details are provided on the ring);
- Avoid the unnecessary discharge of ballast water;
- Use filtration procedures during loading in order to avoid the uptake of potentially harmful aquatic organisms, pathogens and sediment that may contain such organisms;
- Ensure that routine cleaning of ballast tanks to remove sediments is carried out, where practicable, in mid-ocean or under controlled arrangements in port or dry dock, in accordance with the provisions of the ship's Ballast Water Management Plan;
- Ensure all equipment (e.g. arrays, streamers, tail buoys etc) that has been used in other regions is thoroughly cleaned prior to deployment;
- Implement a waste management system that addresses all wastes generated at the various sites, shore-based and marine. This should include:
    - Separation of wastes at source;
    - Recycling and re-use of wastes where possible;
    - Treatment of wastes at source (maceration of food wastes, compaction, incineration, treatment of sewage and oily water separation).
- Implement leak detection and repair programmes for valves, flanges, fittings, seals, etc.
- Use a low-toxicity biodegradable detergent for the cleaning of all deck spillages.
- The vessel operators should keep a constant watch for marine mammals and turtles in the path of the vessel.
- Keep watch for marine mammals behind the vessel when tension is lost on the towed equipment and either retrieve or regain tension on towed gear as rapidly as possible.
- Ensure that 'turtle-friendly' tail buoys are used by the survey contractor or that existing tail buoys are fitted with either exclusion or deflector 'turtle guards'.
- Ensure vessel transit speed between the survey area and port is a maximum of 12 knots (22 km/hr), except in the MPAs where it is reduced further to 10 knots (18 km/hr) as well as when they are present in the vicinity.
- Ensuring that loads are lifted using the correct lifting procedure and within the maximum lifting capacity of crane system.
- Minimise the lifting path between vessels.
- Undertake frequent checks to ensure items and equipment are stored and secured safely on board each vessel.

- In the event that equipment is lost during the operational stage, assess safety and metocean conditions before performing any retrieval operations. Establishing a hazards database listing the type of gear left on the seabed and/or in the Survey area with the dates of abandonment/loss and locations, and where applicable, the dates of retrieval
- Use low toxicity dispersants cautiously and only with the permission of DFFE.
- As far as possible, and whenever the sea state permits, attempt to control and contain the spill at sea with suitable recovery techniques to reduce the spatial and temporal impact of the spill
- Ensure adequate resources are provided to collect and transport oiled birds to a cleaning station.
- Ensure offshore bunkering is not undertake in the following circumstances:
  - Wind force and sea state conditions of ≥6 on the Beaufort Wind Scale;
  - During any workboat or mobilisation boat operations;
  - During helicopter operations;
  - During the transfer of in-sea equipment; and
  - At night or times of low visibility.

11.4.2 FISHERIES

- Avoid operating during June and July, in order to avoid periods of peak fishing effort by the large pelagic longline sector.
- Prior to the commencement of seismic survey activities the following key stakeholders should be consulted and informed of the proposed seismic survey programme (including navigational co-ordinates of location, timing and duration of proposed activities) and the likely implications thereof (specifically the exclusion and safety zone around the seismic vessel):
  - Fishing industry associations: SA Tuna Association; SA Tuna Longline Association and Fresh Tuna Exporters Association.
  - Other key stakeholders: SAN Hydrographer, South African Maritime Safety Association, Ports Authority and the DFFE Vessel Monitoring, Control and Surveillance Unit in Cape Town.
- These stakeholders should again be notified at the completion of the project when the survey and support vessels are off location.
- Request, in writing, the SAN Hydrographer to broadcast a navigational warning via Navigational Telex (Navtext) and Cape Town radio for the duration of the seismic survey activity.
- Distribute a Notice to Mariners prior to the commencement of the seismic survey operations. The Notice to Mariners should give notice of (1) the co-ordinates of the survey area, (2) an indication of the proposed survey timeframes, (3) the dimensions of the towed gear array and dimensions of the safety zone around the seismic vessel, and (4) provide details on the movements of support vessels servicing the project. This Notice to Mariners should be distributed timeously to fishing companies and directly onto vessels where possible.
- An experienced Fisheries Liaison Officer should be placed on board the seismic or guard vessel to facilitate communications with fishing vessels in the vicinity of the seismic survey areas.
- The lighting on the seismic and support vessels should be managed to ensure that they are sufficiently illuminated to be visible to fishing vessels, as well as ensure that it is reduced to a minimum compatible with safe operations whenever and wherever possible.

- Notify any fishing vessels at a radar range of 12 nm from the seismic vessel via radio regarding the safety requirements around the seismic vessel.
- Implement a grievance mechanism in case of disruption to fishing or navigation.

11.4.3 HERITAGE

The following recommendations are based on the UNESCO ICHC guidelines and is aimed at safeguarding the cultural heritage of the small-scale fishers and cultural groupings in influence of this project:

- Re-assess post-project the potential effects on the identified communities and their intangible cultural heritage. This will require consideration of the socio-economic baseline developed during this environmental impact process against quantified economic damage and losses and human development impacts in a follow-up socio-economic assessment. It will enable the heritage specialist to evaluate the link between the socio-economic changes induced by the proposed project as it relates to changes in the intangible cultural heritage practices of the communities. It is anticipated that this can be achieved through the implementation of the mitigation measures in the Social Impact Assessment.
- Based on the outcomes, provide resources and support for communities to develop and undertake safeguarding measures or plans to enhance the mitigation capacity of their intangible cultural heritage by fostering dialogue, mutual understanding and reconciliation between and within communities. It is anticipated that this can be achieved through the implementation of the mitigation measures in the Social Impact Assessment.
- 3D seismic surveys have the potential to locate wrecks on the surface, and sometimes below sediments on the ocean floor. Any shipwrecks or pieces thereof noted during the survey must be shared with the SAHRA MUCH Unit for inclusion into the national database. These could then be identified and be incorporated into the EMPr.

11.4.4 SOCIAL

Based on the findings, the following recommendations are made:

- TGS should develop a community engagement protocol that is based on the San Code of Research Ethics. This should be done in consultation with the affected communities. This should include a communication strategy and grievance mechanism.
- TGS should contribute to assisting with collaboration on independent research on how fish species on the West Coast such as snoek respond to seismic surveying. Collaboration across seismic operators with holders of hydrocarbon exploration and the industry as a whole to collectively fund pro-active research would provide opportunity for the development and implementation of a structured and experimentally sound acoustic study. This would quantitatively inform the authorities and stakeholders of acoustic impacts to the various faunal groups in South African Waters. It is recommended that the Department of Agriculture, Forestry and Fisheries, Oceans & Coasts, Research component be contacted for possible collaboration on further research on the impact so seismic surveys on the marine ecosystem.
- Consult with communities on potential ways in which to make a positive contribution to the communities.
- A representative from TGS should consult with the traditional leadership of the affected communities to establish what their understanding of meaningful consultation is and how communities should be consulted in future. This will assist with establishing the relationship between TGS and the traditional communities. Given the socio-political environment, opposition to the project and associated non-technical risks, further meaningful engagement with the leadership and communities are critical from a social perspective. Given the risk of stakeholder fatigue, it would be most beneficial if this can take place on an industry level.

- TGS should initiate discussions in their industry. The seismic survey industry should reassess their position and social licence to operate as an industry in a South African context and conduct a strategic environmental assessment of the impact of the industry and embark on an awareness raising and education campaign. Having meetings will not be sufficient. Participatory processes and workshops where communities can engage in experiential learning should be considered. If the seismic survey industry fails to address the community's need for education and cooperation it will result in significant delays and increase the risk for social unrest.

11.4.5 ACOUSTICS

Relevant mitigation measures are recommended to minimise the seismic impact on assessed marine fauna species:

- Recommended safety zones are based on the maximum threshold distances modelled for PTS (marine mammals and sea turtles) and potential mortal injury (fish) due to immediate exposure from single pulses and cumulative exposure from multiple pulses.
- Implement a soft-start procedure if testing multiple seismic sources. Delay soft-starts if shoaling large pelagic fish, turtles, seals, or cetaceans are observed within the zone of impact.
- Baseline noise measurements can provide useful information (prior to operations) when interpreting underwater noise predictions for the introduction of a new noise source. As such, it is recommended that underwater noise measurements be implemented that would include the deployment of underwater sound monitoring equipment to establish an actual baseline prior to the commencement of the survey and then operational levels of noise during the survey.
- In the unlikely event that multiple surveys would take place at the same time, during seismic pulse releases, maintain a distance of at least 40 kilometres from any other survey vessel until sufficient objective evidence is obtained from modelling that a reduced buffer distance is acceptable.

12 ASSUMPTIONS AND LIMITATIONS

12.1 GENERAL

In determining the significance of impacts, with mitigation, it is assumed that mitigation measures proposed in the report are correctly and effectively implemented and managed throughout the life of the project.

12.2 MARINE ECOLOGY

As determined by the terms of reference, this study has adopted a 'desktop' approach. Consequently, the description of the natural baseline environment in the study area is based on a review and collation of existing information and data from the scientific literature, internal reports and the Marine Mammal Observer (MMO) Reports. The sources consulted are listed in the Reference chapter.

The assumptions made in this specialist assessment are:

- The study is based on the project description made available to the specialist at the time of the commencement of the study.
- Some important conclusions regarding the extent of the zones of impact of seismic sound and associated assessments on marine fauna are based on the results of the Underwater Acoustic Modelling Study (SLR 2022).
- Potential changes in the marine environment such as sea-level rise and/or increases in the severity and frequency of storms related to climate change are not included in the terms of reference and therefore not dealt with in this report.
- All identified marine impacts are summarised, categorised and ranked in appropriate impact assessment tables, to be incorporated in the overall EIA Report.

Information gaps include:

- details of the benthic macrofaunal communities beyond the shelf break;
- details on demersal fish communities beyond the shelf break;
- information specific to the marine communities of seamounts (Tripp Seamount, Child's Bank) and submarine canyons (Cape Canyon and Cape Point Canyon); and
- current information on the distribution, population sizes and trends of most cetacean species occurring in South African waters and the project area in particular.

Keeping these information gaps in mind, the assessment of impacts has adopted a strongly precautionary approach.

12.3 FISHERIES

The study is based on a number of assumptions and is subject to certain limitations, which should be noted when considering information presented in this report. The validity of the findings of the study is not expected to be affected by these assumptions and limitations:

- The official governmental record of fisheries data was used to display fishing catch and effort relative to the proposed project area. These data are derived from logbooks that are completed by skippers, and it is assumed that there will be a proportion of erroneous data due to mistakes in the capturing of these data into electronic format. The proportion of erroneous data is estimated to be up to 10 % of the total dataset and would be primarily related to the accurate recording or transcription of the fishing position (latitude and longitude). Where obvious errors in the reporting of fishing positions were identified these were excluded from the analysis.

- In assessing the impact of the proposed exclusion zone on fishing operations, catch and effort figures are quoted across the entire extent of the Application Areas. In practice, the exclusion area would be a moving exclusion zone of approximately 165 km^2 extending around the vessel (based on the required safety clearances shown in Figure 2.1 of the Fisheries report). The approach adopted for this report is likely to be an overestimate of the potential impact on fishing operations which in reality could continue within certain portions of the Application Area.
- The acoustic impact is transitory i.e. the sound source moves in space and time as the survey progresses within the target area.
- The effects of seismic sound on the CPUE of fish and invertebrates have been drawn from the findings of international studies. To date there have been no studies focused directly on the species found locally. Although the results from international studies are likely also to be representative for local species, current gaps in knowledge on the topic lead to uncertainty when attempting to accurately quantify the potential loss of catch for each type of fishery. Research into the effects of seismic sound on marine fauna is ongoing.

12.4 HERITAGE

Not detracting from the stakeholder engagement completed, it is necessary to realise that the intangible heritage elements identified during engagements do not necessarily represent all possible intangible cultural heritage elements present in this region. Various factors account for this, including the layered histories (e.g., memory of conflict, dispossession, and disempowerment through time) associated with the West Coast region, specifically in terms of intangible and living heritage resources associated with the ocean landscape. The values attributed to the ocean by the communities do not necessarily align to provide one definitive single significance to the ocean. Instead, the depth and complexity of values assigned to intangible heritage in this landscape depends on peoples' relationship to the ocean and their feelings about the proposed project.

12.5 SOCIAL

The following assumptions and limitations were relevant:

- Not every individual in the community could be interviewed therefore only key people in the community were approached for discussion. Additional information was obtained using existing data.
- The social environment constantly changes and adapts to change, and external factors outside the scope of the project can offset social changes, for example changes in local political leadership, droughts or economic conditions. It is therefore difficult to predict all impacts to a high level of accuracy, although care has been taken to identify and address the most likely impacts in the most appropriate way for the current local context within the limitations.
- Given that the survey will be conducted over a short period of time, the impacts will be short term and from an outsiders perspective may appear as inconsequential. However, the outcomes of the survey will introduce new social impacts, and the potential of these impacts occurring is already causing fear and uncertainty amongst coastal communities. Communities view the survey as the beginning of potentially significant changes in their socio-economic environment.
- Social impacts can be felt on an actual or perceptual level, and therefore it is not always straightforward to measure the impacts in a quantitative manner.
- Social impacts commence when the project enters the public domain. Some of these impacts will occur irrespective of whether the project continues or not, and other impacts have already started. These impacts are difficult to mitigate and some would require immediate action to minimise the risk.
- There are different groups with different interests in the community, and what one group may experience as a positive social impact, another group may experience as a negative impact. This duality will be pointed out in the impact assessment phase of the report.

FC28

- Social impacts are not site-specific, but take place in the communities surrounding the proposed development.
- Limited time was available for conducting the assessment.

12.6 NOISE / ACOUSTICS

The assumptions made in the noise technical report are as follows:

- One survey line section is assumed to be acquired within the 24-hour period for each scenario.
- For marine seismic surveys, the cumulative exposure level at certain locations is modelled based on the assumption that the animals are constantly exposed to the survey airgun noise at a fixed location over the entire 24-hour period.

13 AFFIRMATION REGARDING CORRECTNESS OF INFORMATION

We Liam Whitlow and Gideon Petrus Kriel, herewith undertake that the information provided in the foregoing report is correct to the best of our knowledge, and that the comments and inputs from stakeholders and Interested and Affected Parties has been correctly recorded in the report where applicable as well as inputs and recommendations from the specialist reports completed as part of this assessment.

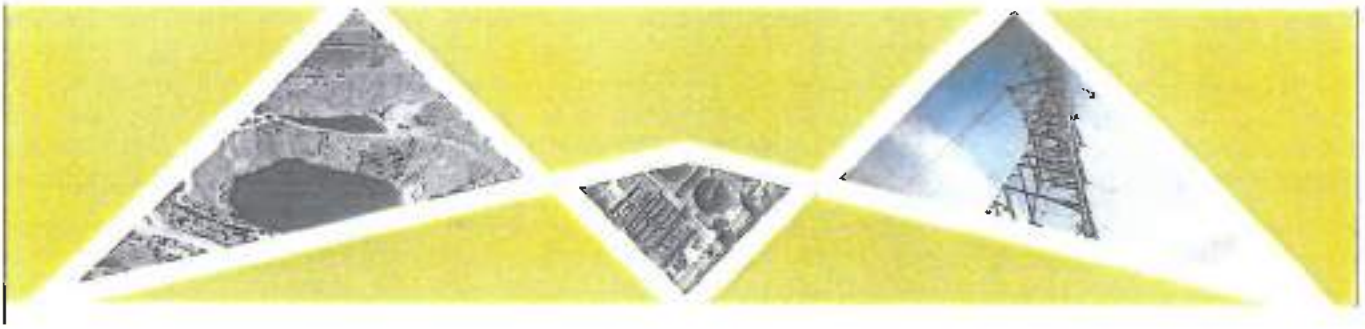
Voorgestelde TGS Orange Basin Verkennings Permit Basiese Assessering

29 Augustus – 3 September 2022



Agenda

Vergadering Reëls	Projek Beskrywing	Projek Span	Aanvraag Proses
Publieke Deelname	Impak Sessies	Pad Vorentoe	Vrae

Vergadering Reëls

3

Vergadering Reëls

- Respekteer die ander
- Moet asseblief nie ander sprekers onderbreek nie
- Hou asseblief vrae vir die einde van die aanbieding
- Noem asseblief eers jou naam voor jou kommentaar of vraag
- Hou kommentaar en vrae tot die punt van die vergadering
- Praat hard en duidelik

4

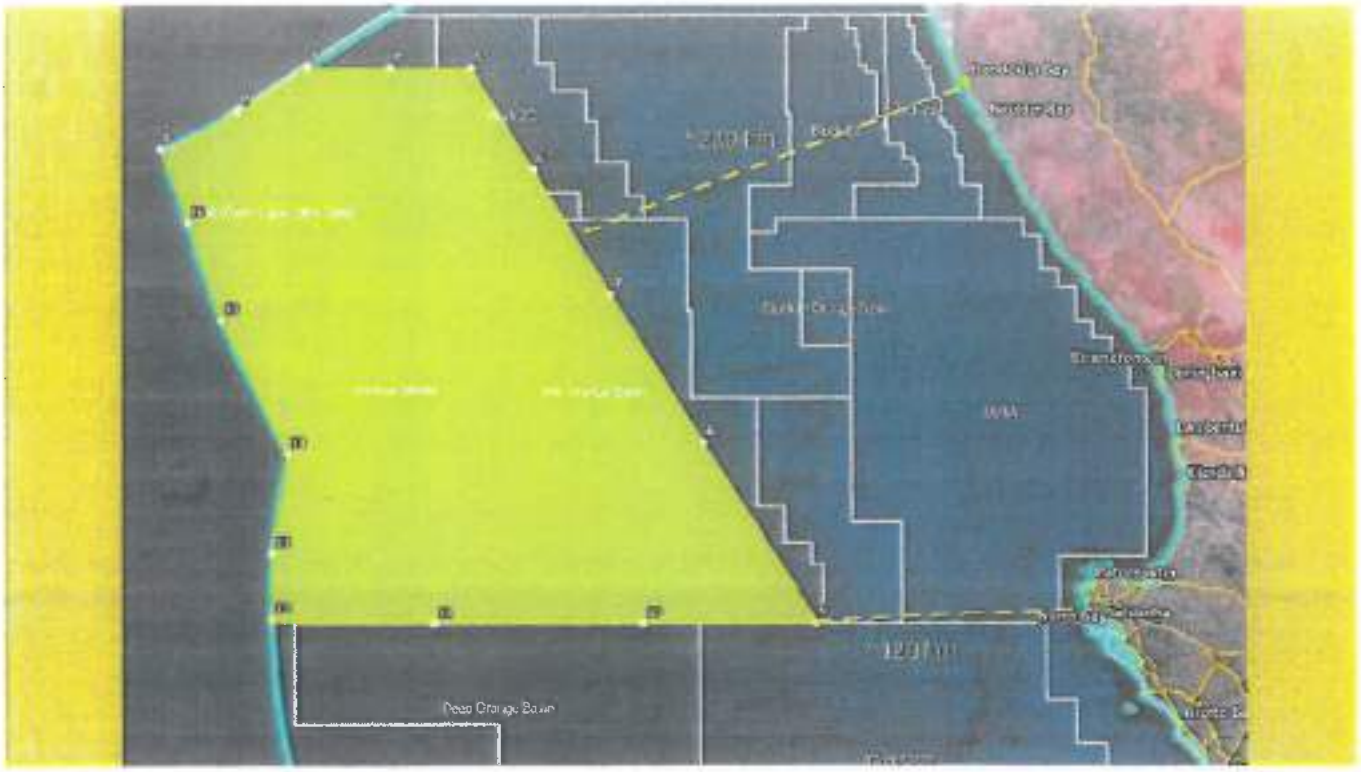
Projek Beskrywing

5

Projek Beskrywing

- TGS Geophysical Company (UK) Limited stel voor om 'n 3D seismiese opname aan die Weskus van Suid-Afrika te onderneem.
- Die voorgestelde projekgebied is tussen ongeveer 120 km seewaarts van St Helenabaai gelee, wat noord langs die westelike kuslyn strek, tot ongeveer 230 km seewaarts van Hondeklipbaai oor 'n aantal petroleumlisensieblokke.
- EIMS is aangestel as EAP om aansoek te doen vir Omgewingmagtiging O/S Regulasies, 2014 - NEMA.
- Die doel van hierdie aanvanklike ronde van konsultasie is om te verseker dat ons aanvanklike bekommernisse van die publiek en belangrike I&APs vasvang.

6



7

Projek Beskrywing

- Die beoogde ontwikkeling behels die vestiging van 'n [illegible] aanlegfasiliteit [illegible]
- Daar word voorgestel dat 'n [illegible] aanlegfasiliteit [illegible] die ontwikkeling van die aanlegfasiliteit [illegible] die ontwikkeling van die [illegible] en die [illegible] en [illegible] en [illegible] en

Projek Beskrywing

- EIMS sal 'n omvattende openbare deelnameproses uitvoer in ooreenstemming met die NEMA-vereistes. As deel van ons konsultasie is pogings aangewend om waarnemingsmoontlikhede en kleinskaalse vissers spesifiek as sleutelpartye vir konsultasie te identifiseer.
- Ingeval 'n moontlikheid bestaan dat EIMS ook aangestel kan word vir soortgelyke proses aanvaar te doen vir 'n gebied wat aanvullend met die TGS-aanvraaggebied

- Please speak up and clearly

EIMS

4

Project Description

EIMS

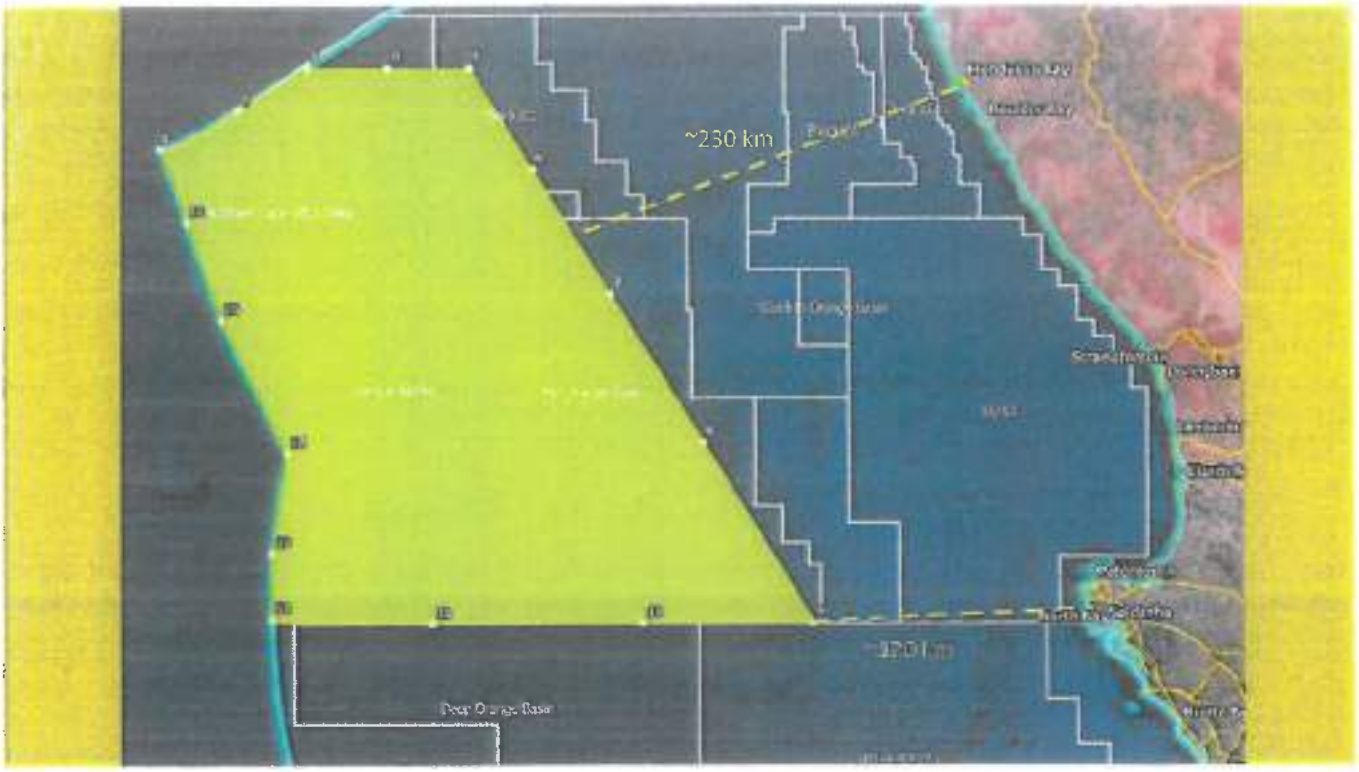
5

Introduction

- TGS Geophysical Company (UK) Limited proposes to undertake a 3D seismic survey off the West Coast of South Africa.
- The proposed project area is located between approximately 120 km offshore of St Helena Bay, extending north along the western coastline to approximately 280 km offshore of Hondeklip Bay over a number of petroleum licence blocks.
- EIMS was appointed as EAP to apply for Environmental Authorisation (EIA Regulations, 2014 NEMA).
- The aim of this initial round of consultation is to ensure we capture initial concerns from the public and key I&APs.

EIMS

6



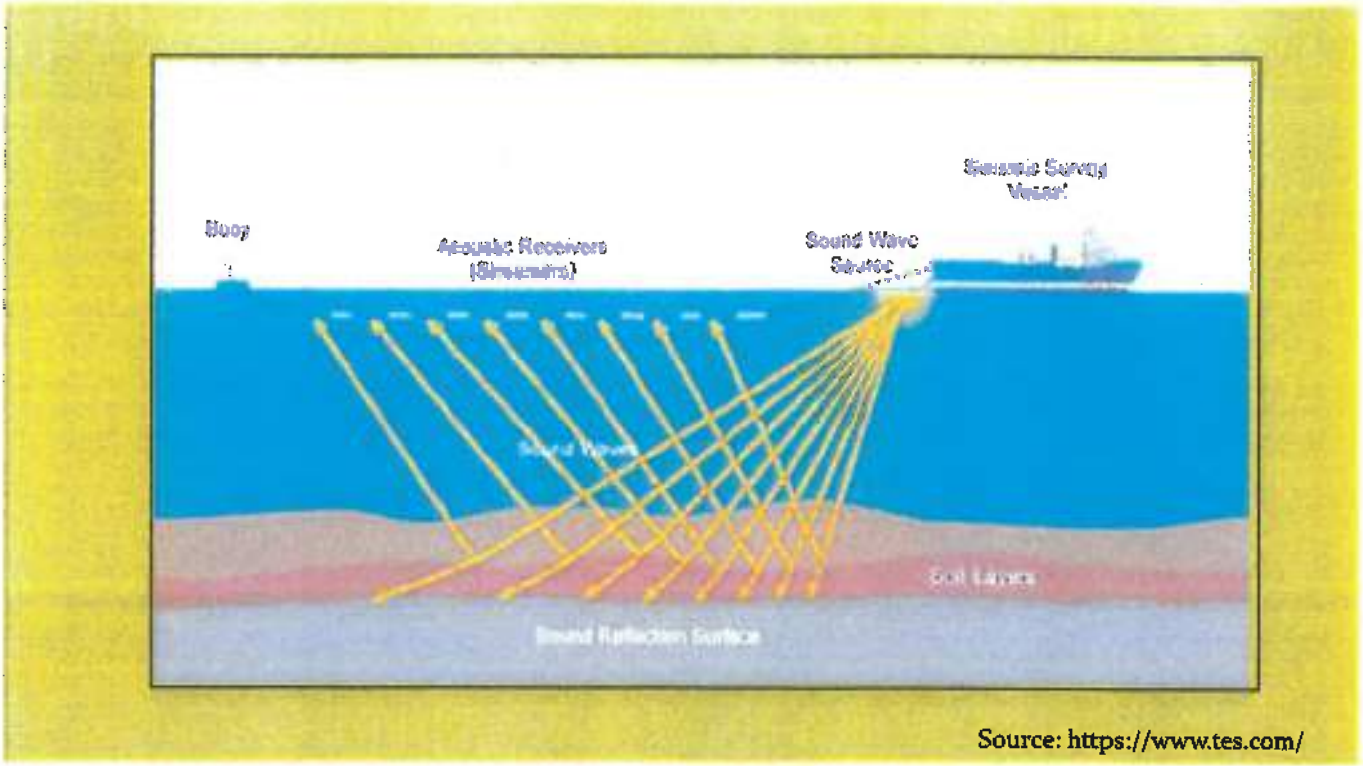
7

Project Description

- The area of interest for the proposed 3D seismic survey is approximately 7,400 km² in extent.
- It is proposed that a single survey vessel equipped with seismic sources and streamers be used. The proposed 3D survey would be supported by two escort vessels. The escort vessel will assist in monitoring for and warning other vessels (e.g. fishing, transport, etc.) about the survey and in the case of maneuverability of the survey vessel.
- As a minimum, one Namibian Liaison Officer (person speaking English and Afrikaans) will be on board either the survey or the escort vessel to facilitate communication in the local language with the fishing (or other) vessels that are in the area.
- Additionally, there will be Marine Mammal Observers on board the survey vessel to monitor for marine mammals and turtles visually and ensure that the survey is conducted in compliance with the specified guidelines as stated in the Environmental Management Programme.
- The 3D survey will take a maximum of 70 days including downtime.

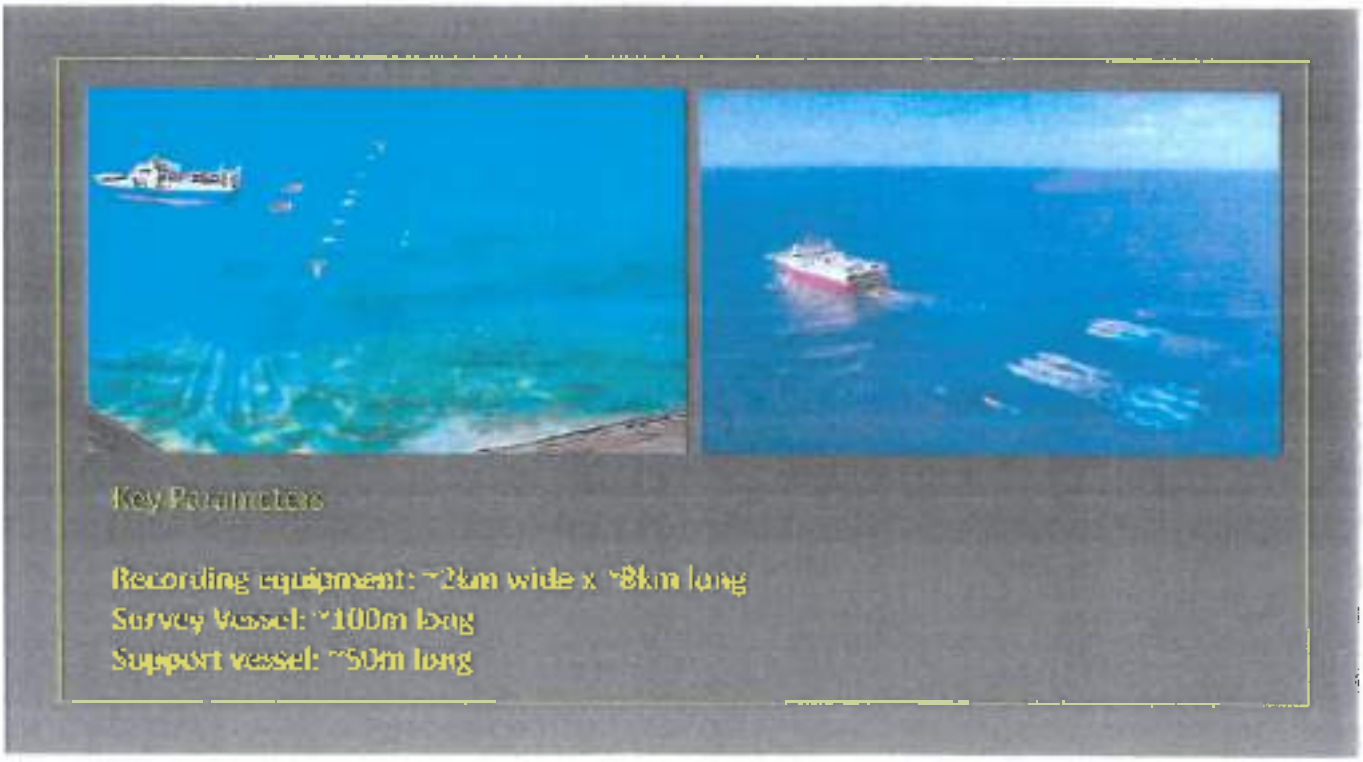
EIMS

8



Source: https://www.tes.com/

9



10

11

Project Description

- EIMS will be conducting a comprehensive Public Participation process in line with the NEMA requirements. As part of our consultation attempts have been made to specifically identify fishing communities and small scale fishers as key parties for consultation.
- Another company, Searcher Seismic, is also in the process of applying for an area that overlaps with the TGS application area.

4

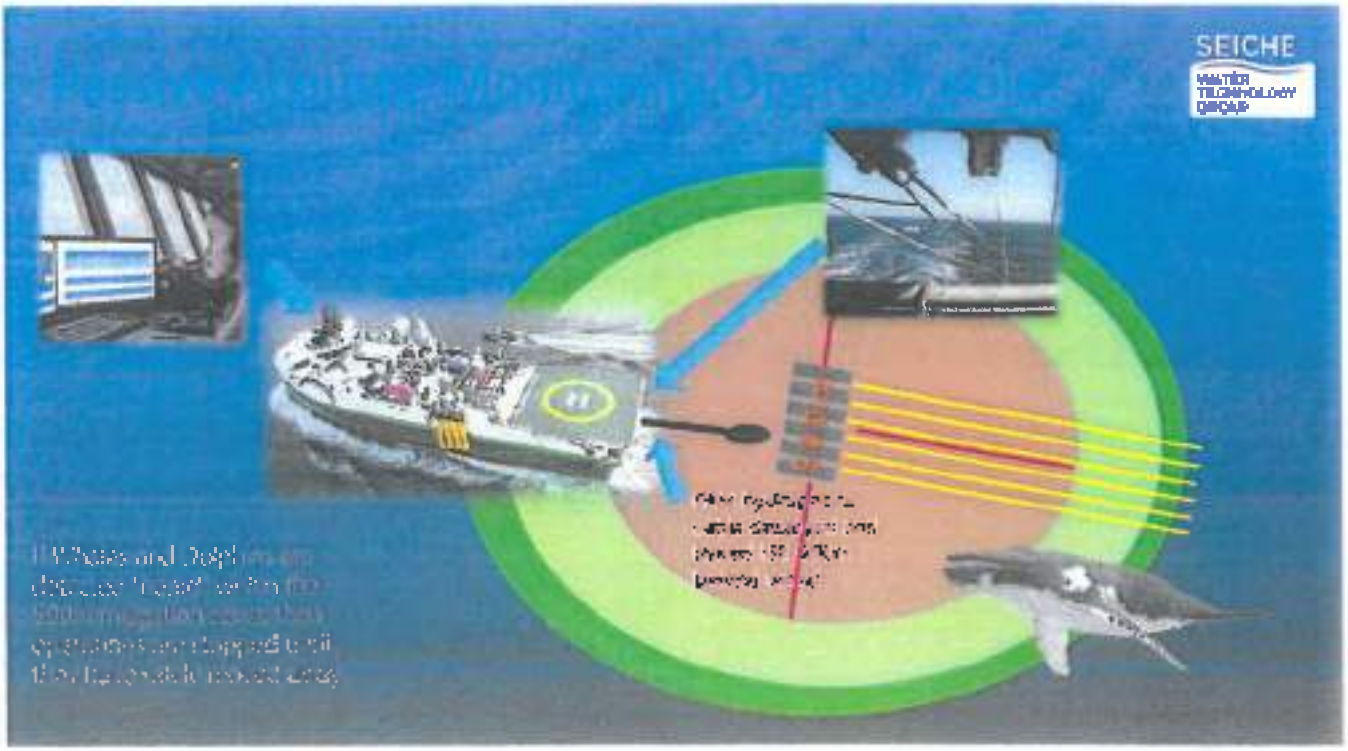
The primary function of Passive Acoustic Monitoring Operators (PAMOs) is to monitor acoustically for marine mammals and ensure that the survey is conducted in compliance with the specified guidelines as stated in the Environmental Management Plan (EMP).

5



SEICHE

6

Responsibilities of MMO and PAM Operators

SEICHE

- Conduct visual and acoustic monitoring for marine mammals and sea turtles
- Brief vessel crew of the mitigation requirements prior to the start of the survey to ensure compliance during operations
- Record sightings and acoustic detections of marine mammals and turtles including photos where possible.
- MMO/PAM reports are sent to Petroleum Agency of South Africa (PASA) environmental compliance department daily for the duration of the survey. Also continuous onshore monitoring of compliance is maintained by the regulatory authority.
- MMO and PAM operators are independent South African contractors and supplied with all equipment and personnel. They are given full authority to stop operations when marine mammals or sea turtles are within the mitigation zones.

7

- HD or 4K video & still imagery
- Compact, [illegible] and easy to mount and fast to deploy
- Remote Activated Device Connection at Sea (RADS) solution
- [illegible]
- [illegible]

8

Fisheries Liaison Officer role

- The primary role of the FLO is to provide support and passive input to create working relationships with fishing vessels which would allow both industries to work side-by-side minimising disruption where possible
- Liaise with skippers of all fishing vessels operating in or near the proposed area daily
- Prepare detailed reports on any incident of interruption to towing operations or any alleged damage to towing gear
- Create an additional communication platform where updates can be given to the Captains of any fishing vessels in the area as well as inform operations when complete
- A Senegalese national speaking FLO [illegible]

9

Communication with fishermen

SEICHE WATER TECHNOLOGY GROUP

- Email to distribute Notice to Mariner and 24hr operational plans.
- WhatsApp and Telegram messages for operational updates
- Automatic Identification System (AIS).
- VHF Channel 16.
- Thermal camera to detect smaller vessels that don't have VHF or Automatic Identification System (AIS) on board.

EIMS	MINUTES OF MEETING		
EIMS Ref	1520	Project Name	TGS RECONNAISSANCE 6A

MEETING DETAILS

Meeting	1520 Pre-application Consultation Public Meeting		
Meeting Venue	Hout Bay Public Library	Date	2022/08/29
		Time	16h00-18h00

A Public Meeting was scheduled during the pre-application phase with the Interested and Affected Parties (I&APs). The aim of the meeting was to capture the initial concerns from the members of the public and key I&APs. During the public meeting which took place between 16h00 and 18h00, a presentation of the project description, preliminary impact assessment, project team and project timeframes was delivered to all attendees of the meeting by Environmental Impact Management Services (EIMS) Pty (Ltd). The presentation was delivered by Mr GP Kriel from EIMS in English, with Andisiwe Xuma available to translation to isiXhosa where required. SEICHE delivered a presentation on the environmental mitigation carried out during seismic surveys in terms of the Marine Mammal Observer (MMO) and Fishing Liaison Officer (FLO) in English. The presentation was delivered by Michelle Rosch. After the presentations were delivered, a question-and-answer session was opened where attendees asked questions or expressed their comments regarding the project. The presentation and attendance register have been attached as an appendix to this document.

AGENDA

Item
1. Opening and welcome GP welcomed all in attendance and explained that it is understood that the low turnout is due to conflicting meeting schedules with the DMRE/PASA and the small-scale fishers. Attendees were informed that if they have specific language preferences other than English then this would be accommodated. General ground rules of the meeting were highlighted and the difference between the Searcher and TGS Application area explained.
2. *EIMS Presentation (Attached)* a. Introducing the project team b. Project Description c. Legal Application Process d. Public Participation e. Impact Assessment f. Project Contact Details g. Presentation from SEICHE
3. *Questions and Answers* The audience were invited to ask questions in any language of preference including English, Afrikaans and isiXhosa.

EIMS ENVIRONMENTAL IMPACT MANAGEMENT SERVICES	MINUTES OF MEETING	
EIMS Ref: 1520	Project Name	TGS RECONNAISSANCE BA

NOTULE/ MINUTES

Item No	Item
1.	*All attendees were requested to sign the attendance register as they entered. Presentations from EIMS and SEICHE of the project description, application process and environmental mitigations during seismic survey were delivered as per the agenda above to the meeting attendees. It was indicated that the meeting would be recorded for the purposes of accurate minute taking. Background Information Documents (in English, Afrikaans and isiXhosa), comments forms, registration, information handouts and attendance registers, were made available at the meeting.* *The attendees were encouraged to submit their comments and concerns through filling in the comment forms provided or by submitting comments to the project email address provided. It was noted that all attendees who have provided their contact details would be registered by default on the I&AP database maintained by EIMS. Following the presentations, the floor was opened for a discussion and the attendees were encouraged to bring up any questions or concerns they had about the project.*
2.	**Questions and Answers**
a.	**IAP1 (American student at UCT)** *IAP 1 asked about the overlap of Searcher and TGS application areas and whether there would be one survey or two conducted.* **GP Kriel** As far as EIMS understands, there will only be one survey in the overlapping area. The reconnaissance permit is only valid for a defined period, which cannot be extended. Once the permit expires then you have to reapply, which is what happened with Searcher.
b.	**IAP2 (Veronica from Bengwela Fishing)** IAP 2 who had arrived late in the presentation asked (in isiXhosa) what is being assessed in the Basic Assessment process. Is the focus on humans, animal, water etc? **GP Kriel** EIMS is the appointed Environmental Assessment Practitioner responsible for managing the environmental application process and associated studies. Ms Xuma explained in isiXhosa that specialists from various fields have been appointed including social, cultural and heritage, acoustics, marine ecology and fisheries to assess how the environment will be impacted by the survey and associated activities. It was explained that the purpose of the survey is to understand the geological composition of the seabed within the application area.
c.	**IAP2 (Veronica from Bengwela Fishing)** Is it the first time this type of survey is being done? **Andiswa Xuma** Ms Xuma explained that it is the first time that TGS is doing this application in the specific application area, however another applicant (Searcher) has applied for a reconnaissance permit in the similar application area. There was a previous permit issued to Searcher that was appealed by the public and thus the permit lapsed before the survey could commence.

EIMS

MINUTES OF MEETING

EIMS Ref	1520	Project Name	TGS RECONNAISSANCE BA

Item No	Item
d.	**IAP2 (Veronica from Benguela Fishing)** Will this survey cause dying of fish, penguins and whales which could be washed up to the shore as this has happened in previous years and the cause was unknown. How will they able to observe these marine animals in the ocean? **Andiswe Xuma** Ms Xuma explained that if the applicant is granted the reconnaissance permit, they will do the 3D seismic survey. As explained by Michelle, MMOs and PAMOs are usually appointed on the survey vessels to monitor the marine animals visually and acoustically and if any are detected within 500 m of the vessel, the survey is paused until the animal has cleared the area. This is a mitigation measure used to minimize the negative impact of survey activity, as a result the survey takes longer due to the stoppages.
e.	**IAP2 (Veronica from Benguela Fishing)** Is this a oil and gas project? Will this survey affect young children? **Andiswe Xuma** Ms Xuma explained that TGS will be conducting the survey in order to determine if there are oil and gas reserves in the ocean at the specified application area. It was explained that the survey will be done 120km offshore and this it is not anticipate that there will be a physical impact on the coastal properties or onshore. A map of the survey application area was displayed
f.	**IAP2 (Veronica from Benguela Fishing)** What type of studies/training should young children from disadvantages communities take in university in order to work in such surveys?. **GP Kriel** It was explained that the reconnaissance survey is a scientific process which requires specialised jobs which requires skills such as geophysics and geologists. Even FMOs, MMOs and PAMOs require specific training and experience so there may not be many jobs in this phase. Should the presence of significant reserves be confirmed, then there would be stimulus of the economy and more general jobs would be created indirectly through support industries such as clinics, hotels, shops, fuel stations etc. But that assessment can only be done once reserves are quantified, but there is so many things that need to happen before oil/gas production occurs. Ms Xuma further explained that job opportunities are limited in the short term. Careers in this line of work include marine biologists, geologists and ecologists. These are long terms studies that require communities to prepare themselves in anticipation of future requirements of the industry.
g.	**IAP2 (Veronica from Benguela Fishing)** How does this survey link to climate change events such as flooding, storms and other disasters. Will the noise not upset the ocean? **GP Kriel** GP explained that every activity we do has an impact on the environment. The role of EIMS is to quantify that impact for this survey. That is why specialists are appointed to understand the impact on the ocean. The carbon impact is difficult to quantify at this stage because there are many other vessels operating in

Item No	Item
	the ocean. Climate change assessments are more applicable at production stage, however assessment of cumulative impacts of all the activities taking place in the vicinity of the application area will be done.
h.	**IAP2 (Veronica from Benguela Fishing)** Why are there few people in attendance when they are missing an opportunity to hear such important information **Andiswa Xuma** EIMS sent out notifications to pre-identified IAPS and distributed invitations to fisherman and people in and around Hout Bay. Newspaper and radio adverts were also published but it is suspected that the main cause for the low turnout is the meeting between PASA and the small-scale fishers in the area which was scheduled at the same time as this public meeting. Similar type of meeting will be held at Sea Point for those who missed today's and all along the West Coast up to Porth Nolloth.
i.	**IAP2 (Veronica from Benguela Fishing)** If oil is discovered, where will it be taken for processing and consumption? Is it processed locally or internationally? **GP Kriel** GP explained that the answer to that is not known at present. There are a few refineries in South Africa. Typically, the oil is brought onshore through a pipeline however the specifics are decided by government and industry players at production stage. Another EIA process would need to be done for that, but those aspects cannot be assessed during this phase of the project.
j.	**IAP2 (Veronica from Benguela Fishing)** Can renewable energy such as solar be considered as an alternative to this type of project? **GP Kriel** GP explained that energy transition to renewables is necessary, however currently South Africa gets their energy mostly from fossil fuels such as coal due to affordability. Getting to 100% renewable will take some time. There are also numerous solar and wind energy projects that add to the energy supply of the country. That's why this type of project is being done because the energy plan is mixed for the short to medium term.
4.	**General** GP thanked everyone for attending and requested that IAPs must please advise if there's anyone who should be consulted or notified during this process..
5.	**Closure** The meeting was closed at 18:05. Two local fisherman approached the meeting venue after it had been closed and explained that they could attend because they were in another meeting regarding coexistance of oil/gas with the fishing industry.

MEETING DETAILS

Meeting	1520 Pre-application Consultation Public Meeting		
Meeting Venue	Life Conference Centre (Three Anchor Bay)	Date	2022/08/30
		Time	16h00-18h00

A Public Meeting was scheduled during the pre-application phase with the Interested and Affected Parties (I&APs). The aim of the meeting was to capture the initial concerns from the members of the public and key I&APs. During the public meeting which took place between 16h00 and 18h00, a presentation of the project description, preliminary impact assessment, project team and project timeframes was delivered to all attendees of the meeting by Environmental Impact Management Services (EIMS) Pty (Ltd). The presentation was delivered by Mr GP Kriel from EIMS in English, with Andiswe Xuma available to translation to isiXhosa where required. SEICHE delivered a presentation on the environmental mitigation carried out during seismic surveys in terms of the Marine Mammal Observer (MMO) and Fishing Liaison Officer (FLO) in English. The presentation was delivered by Michelle Rosch. After the presentations were delivered, a question-and-answer session was opened where attendees asked questions or expressed their comments regarding the project. The presentation and attendance register have been attached as an appendix to this document.

EIMS	MINUTES OF MEETING		
EIMS Ref	1520	Project Name	TGS RECONNAISSANCE BA

NOTULE/ *MINUTES*

Item No	Item
1.	*All attendees were requested to sign the attendance register as they entered. Presentations from EIMS and SEACHE of the project description, application process and environmental mitigations during seismic survey were delivered as per the agenda above to the meeting attendees. It was indicated that the meeting would be recorded for the purposes of accurate minute taking. Background information Documents (in English, Afrikaans and Isikhosa), comments forms, registration, information handouts and attendance registers, were made available at the meeting.* *The attendees were encouraged to submit their comments and concerns through filling in the comment forms provided or by submitting comments to the project email address provided. It was noted that all attendees who have provided their contact details would be registered by default on the I&AP database maintained by EIMS. Following the presentations, the floor was opened for a discussion and the attendees were encouraged to bring up any questions or concerns they had about the project.*
2.	**Questions and Answers**
a.	**IAP1 -Chris Harmer (ADR Fishing)** *Mr Harmer asked about the overlap of Searcher and TGS application areas and whether there would be two separate surveys conducted.* **GP Kriel** As far as EIMS understands, there will only be one survey in the overlapping area. Possibly for the areas outside the overlap there additional survey would be required because the TGS survey area is bigger.
b.	**IAP1 -Chris Harmer (ADR Fishing)** Chris Harmer asked what time of the year would the survey potentially take place. **GP Kriel** GP stated that the timing of the survey is still being considered, taking into account several factors such as migration routes and other logistics of the site. Typically, the season that would look at is around December to March/April. **IAP1 -Chris Harmer (ADR Fishing)** In the fishing industry, it is also seasonal. What is the procedure to lodge our concern as a tuna fishing industry that the high seas is during December to April as well. **GP Kriel** Well you can start by send that concern to us as the Environmental Consultants, obviously there are some scheduling and location options that can be considered to see if there's a way for the survey and the fishing operations can take place at the same time. The surv will not be done across the whole application area at the same time, so a specific area might be targeted for a certain period. So start by send that concern to us, then we will forward it to TGS, they can look at it and provide feedback. **IAP1 -Chris Harmer (ADR Fishing)** The December to April period that has been indicated, is that based on mammal migration at the moment? What's setting that, is it weather or migration.

EIMS	MINUTES OF MEETING		
EIMS Ref	1520	Project Name	TGS RECONNAISSANCE BA

Item No	Item
	GP Kriel Yes, its based on usual migrations and other factors including the best time to go out to do survey. **IAP1 -Chris Hamner (ADR Fishing)** So are you saying theres a low possibility of a May to September period for the survey? **GP Kriel** Yes, typically they would do the survey between December to April. However, we will have a look, our specialists will also take a look at the actual migration routes of the various species and fishing that happens. Once we have a clear picture of that, we'll put that in the Basic Assessment Report for review. **IAP1 -Chris Hamner (ADR Fishing)** December to March works best for the Fishing industry, im aware of some other pelagic fishers that fish off the West Coast, thats the biggest there. Then there's the hake trawl and tuna fisheries and December-Jan-Feb are pretty much quieter months of the year. So if that was possible, it would offer these businesses, if the industry were to put up any resistance.
c.	**IAP2- Liz McDaid (Green Connection)** I have alot of questions, I dont know who else wants to ask questions but my question is who commissioned TGS. **GP Kriel** We are not sure about that. **IAP2- Liz McDaid (Green Connection)** Who owns TGS, it sounds like Total something something. **GP Kriel** Again, I'm not 100% sure who TGS is owned by but as far as we understand they are a geophysical company, they do surveys not just for the oil and gas industry but wind and offshore wind projects. **IAP2- Liz McDaid (Green Connection)** So can we ask for their biography to be included in the report, like who they are etc. **GP Kriel** Yes, they are an international company who work all around the world, so we can include that. **IAP2- Liz McDaid (Green Connection)** Climate change is not mentioned in the BID, why not? **GP Kriel** At this stage, the climate change issue we recognise that would be a bigger thing to consider during the production phase of the project. We can't really quantify the climate change impact because we don't know what the resources isand how much of that would be extracted. So I think for us to assess that right now as part of the reconnaissance is not really accurate.

EIMS | Environmental Impact Management Services

MINUTES OF MEETING

EIMS Ref	1520	Project Name	TGS RECONNAISSANCE BA

Item No	Item
	IAP2- Liz McDaid (Green Connection) My other question is needs and desirability, which acts as an indication of climate change but on what basis, presumably you do have a needs and desirability motivation. **GP Kriel** Yes,we are going to have a section designed according to the needs and desirability guidlines , we'll havedetailed table for needs and desirability where we will assess different policies and documents that motivate for it. There's the Integrated Resource Plan that says that we need to identify potential resources then there's climate change agreements that we have made as a country.
d.	**IAP2- Liz McDaid (Green Connection)** Peer Review, the studies that you have done, we know that there are serious concerns about the consultants that you have appointed, so we will obviously put in objections. They are facing allegations of bias, but what I want to know is will you do independent peer reviews? Will you allow civil society to put forward peer reviews of the studies? **GP Kriel** At the moment we haven't put that in, but thats something we can have a look at. We obviously know that the information that goes into the reports will be made available to everyone for review. **IAP2- Liz McDaid (Green Connection)** Can we have the terms of reference of the specialist studies now? **GP Kriel** I'll have to get back to you on that, but all the reports will have a specified terms of reference included in them. **IAP2- Liz McDaid (Green Connection)** Will you pecify the terms of reference yourself? Youre asking us to comment at this stage and we would want to comment on the terms of reference. Last time we asked that question, the company said sorry talk to our lawyers. **GP Kriel** Alright, we can take a look at that. Yes, I think terms of reference should be open information .
e.	**IAP2- Liz McDaid (Green Connection)** You have explained your community engagement process, but what I wanted to understand is what lesson are you taking from the court cases? **GP Kriel** What we've learnt is that there was probably insufficient consultation especially with indigenous leaders. So we have Wouter and the Social impact specialists having a look at that. We realize that the social aspect was maybe looked at in passing instead of appreciating a detailed look at that. So we are trying to have a better look at the social component, the cultural heritage impact to see what the community members are saying. We are trying to make contact with as many people as possible, meeting and speaking with traditional leaders because that is important. Similarly with the fishing communities, we are trying to engage with them as much as possible.

EIMS

MINUTES OF MEETING

EIMS Ref	1520	Project Name	TGS RECONNAISSANCE BA

Item No	Item
f.	**IAP2- Liz McDaid (Green Connection)** Can I just come back to this issue of the overlap, the Searcher process is probably one week ahead. Are you saying that these two companies are running the same seismic survey over what looks like 70% of the same area. Or are you saying that Searcher is going to stick to the yellow block and TGS will stick to the areas outside of the Searcher application area (brown block). How does it actually work because presumably someone has permission, and in my mind thats the same owners of those blocks that commission two separate companies, can you explain? **GP Kriel** It's probably a case of both TGS and Search trying to position themselves to be able to do those surveys but then who gets the contact to do the surveys is not known. **IAP2- Liz McDaid (Green Connection)** What I'm trying to understand is if the guy who owns the block has to give permission, do they have to apply or are Searcher and TGS applying on their own. **GP Kriel** Searcher and TGS are applying on their own, but that's just reconnaissance / 3D Seismics. **IAP2- Liz McDaid (Green Connection)** So PASA can allow anybody to come into the sea to do seismic surveys without any permission from the block owners? **GP Kriel** Yes, so the license block holders would have to give their reports and to the application they would need to give permission as far as I understand. **IAP2- Liz McDaid (Green Connection)** So the license block owners are giving permission to two companies to operate in the same area **GP Kriel** Well they wont have permission to operate concurrently, its not going to happen at the same time.
g.	**IAP2- Liz McDaid (Green Connection)** Okay so now this is where I want to get to the cumulative decision making, presmably youre going to have to look at the worst case scenario they do get permits to operate at the same time. **GP Kriel** Yes we are going to look at that, obviously where the areas are overlapping, there the cumulative impacts wont be assessed, but only in the areas outside the overlap. **IAP2- Liz McDaid (Green Connection)** But thats what I dont understand, whats to stop both companies getting the rights to do the survey in the overlap area at the same time because there's only a short window. **GP Kriel** Yes , they could but they are not going to be doing that. Because it depends on whoever comissions the survey. GP requested Micheal to give further inputs.

MINUTES OF MEETING

EIMS Ref	1520	Project Name	TGS RECONNAISSANCE BA

Item No	Item
	Micheal (TGS) There will not be two overlapping surveys, there will be one survey shot in the area whether it be by Searcher or TGS. **IAP2- Liz McDaid (Green Connection)** So how do you know that? **Micheal (TGS)** Because usualy the validity is over a financial year
h.	**IAP 3- Kim Day (Birdlife)** So can I just clarify this, so TGS and Searcher are both vying for the same prospecting contract. So it is a hypothetical situation which will only come into effect depending on which company gets permission. So why are we here? Is this something that is actually going ahead or are we here on a hypothetical thing that if you get permission before Searcher does, then TGS will get the contract. **Micheal (TGS)** Yes, hypothetically. **IAP 3- Kim Day (Birdlife)** I have a problem with that because it is not clear at all the BID. That is something that has not been transparently communicated in any way. This is an incredibly confusing situation, we are here now as part of a competitive bid for this contract. Now why is that not put on the table? It needs to be transparent, you cant even tell us who owns TGS, whose paying your fees. **GP Kriel** The client is TGS, EIMS is working for them, they commissioned the study. Similarly to the Searcher, they commissioned the study. As to who their client are, that we do not know. **IAP1 -Chris Harmer (ADR Fishing)** Can I ask everyone to identify themselves, I think you made that point in the beginning, the gentleman in the back I don't know him. **Micheal (TGS)** Yes , I am Mike Fayard, I work for TGS in the U.S. TGS is a wholly publicly trading company . **IAP 3- Kim Day (Birdlife)** Sir who are you doing the survey on behalf of? **Micheal (TGS)** TGS hasn't been commissioned by anyone to do the survey, we are applying for a permit over a prospective area. If the permit is issued, then we will look at who basically would fund the survey.

EIMS	MINUTES OF MEETING		
EIMS Ref	1520	Project Name	TGS RECONNAISSANCE BA

Item No	Item
	Ijust want to understand something the, can I ask directly. When you applied to PASA,or have tou not applied, didnt you have to get permission of the people who own those blocks? **GP Kriel** The reconnaissance permit application has been submitted but the environmental authorisation (EA) application has not. **IAP2- Liz McDaid (Green Connection)** But for the re connaissance permit, you didnt have to get permission from the people who own those blocks? **Micheal (TGS)** Not to apply for a permit, as far as I understand. **IAP2- Liz McDaid (Green Connection)** And PASA accepts that? **GP Kriel** I can revert to you on that, I dont know the logistics of the reconnaissance permit application, ours was just to do the EA application
j.	**IAP 8- Kim Dey (Birdlife)** So TGS only does reconnaissance, it doesnt do exploration? So at that point the permit application would be awarded to a different company. **GP Kriel** So remember they are a geophysical company, they would get data and if someone wants to utilize that data they can but that and they use that for where the would want to drill etc. An exploration company would do that **IAP2- Liz McDaid (Green Connection)** So I just want to be clear, that as we stand in this room, it seems that a hundred companies could arrive and apply for the same area to do the seismic survey. **GP Kriel** Yes, unfortunately, it works like that with recolnnaissance. So for recolnnaissance,, you can have overlapping area but for exploration and production you cant. **IAP2- Liz McDaid (Green Connection)** So if everybody can apply, what is to stop everyone being given the right to do it? Why are you letting 100 people apply, if youre only in the end going to giver the permit to one person or can they all get permesion? **GP Kriel** They can theoretically get permission, but whether they would want to spend all that money if noone is going to buy that data from them. It would be a financial decision they would have to make. **IAP2- Liz McDaid (Green Connection)**

EIMS	MINUTES OF MEETING		
EIMS Ref	1520	Project Name	TGS RECONNAISSANCE 6A

Item No	Item
	Yeah, they can dot it, well these guys are doing it even though Searcher has applied for the area. TGS thinks they have a going chance.I'm assuming youve got clients sitting in the wings who are saying go do the survey and come back to us with the results. **Micheal (TGS)** Yes, there's always whoever runs the exploration blocks. Most countries in the world now are coming into an area and loooking at having 5 companies applying for a permit to do the survey but one company is gonna end up with the permit, not all of them. Whoever gets that does the survey, you can then cooperate with the company that , whether thats impact or Searcher, less environmental impact. Once the permit and EA are issued, it becomes a point okay we got this and the timeframe the survey needs to be looked at and who owns the block, does it make sense economically for TGS to sell the data or buying. Alot of it is based on such, may not have anything to do with the geology or the profit of oil/gas here. Some of it may be across the atlantic region, or in South America, where they look at the geological basins are tied together and they look at those areas and say well theres lots of prospecting activity here based on or other areas in the world and say, is there interest? But we wont be shooting surveys on top of each othare, if anything it can come down to apoint of cooperation.
k.	**IAP 3- Kim Day (Birdlife)** I do totally understand that, its just that the meeting must be called under much clearer pretences and that I just feel, here youre sitting in front of an audience who is informed but you are taking this up the coast to talk to community leaders and to local fishermen where have to clearly explain this. I also feel that, we also need to point out that these application areas dooverlap with existing oil/gas concessions. As far as I can see, they overlap with Total, PetroSA, Sasigen, Wessacor, so those companies, there are concessions. So whose concession do those overlap? **GP Kriel** Basically all those license holders that you mentioned, so its actually the area. **IAP 3- Kim Day (Birdlife)** Do the concession owners know of it? **GP Kriel** Yes, we have included them as I&Aps in our database, I can give that information from the top of my head right now. **IAP 3- Kim Day (Birdlife)** Can we have that information on a map in your presentation/report, its fundemental information. We'd like to see where the prospecting/reconnaissance area overlap with the oil/gas company concession areas. **GP Kriel** Yes, we'll make sure that is included in the Basic Assessment Report and if possible we'll also include that in our presentations going forward. **IAP 3- Kim Day (Birdlife)**

EIMS	MINUTES OF MEETING		
EIMS Ref	1520	Project Name	TGS RECONNAISSANCE BA

Item No	Item
	I think transparency is the key word, we have to know whats going on here, this is exactly why things get interdicted. Without that transparency, we cannot begin to comment on what the possible impacts will be. **IAP2- Liz McDaid (Green Connection)** Yes, there's no meaningful consultation without transparency, its also important to explain how it works, the economics of it, as Micheal explained, that should all be in the BID document.
1.	**MP2- Liz McDaid (Green Connection)** Now I want to comment on the monitoring, obviously the marine ecologist will make comment, for example the Searcher and Shell cases, there were some very key issues around the failures of environmental monitoring, so do have answers in terms of exactly how will that be fixed? **GP Kriel** We could ask the question and get back to you. **IAP2- Liz McDaid (Green Connection)** So the good thing is that infrared camera, but you said could, not will. **Michelle (Seiche)** Yes, because we didn't provide environmental services for those projects for Shell and Searcher. The camera is part of Seiche equipment as well as acoustic monitoring equipment/ software and hydrophone are used worldwide to increase detection and support for the guys to monitor visually and acoustically on board. Thats all within our parameters, not necessarily other companies, it is hired out to other companies who would like to use it, I think its mandatory in the U.S, alot of the thermal imaging cameras are used there alot. **IAP2- Liz McDaid (Green Connection)** So can I just clarify, you guys are appointed to do the monitoring. So you will have or wont have thermal imaging? What is your job now? **Michelle (Seiche)** Yes, we will have thermal cameras if we are part of the survey. **GP Kriel** Her job is to provide context and explain some of the mitigation measures. **IAP2- Liz McDaid (Green Connection)** So you aren't contracted to be on the ship right now? **Michelle (Seiche)** No, we still have to submit proposals and pricing, along with other companies doing exactly the same thing. **IAP2- Liz McDaid (Green Connection)** Okay now the issue is that you present, like the really best case stuff but you didnt explain that you guys are not necessarily going to be on the boat and that stuff might not be on the boat, again there's a lack of transparency.

MINUTES OF MEETING

EIMS Ref	1520	Project Name	TGS RECONNAISSANCE BA

Item No	Item
	GP Kriel I think the idea is just to provide context as to how the mitigation measures would be implemented on the boat. **IAP2- Liz McDaid (Green Connection)** Except that nobody else is probably going to have that thermal imaging camera. **Michelle (Seiche)** We do hire them out to the rest of the companies, so for us its pretty much there but we do hire them to other companies in the U.S. No matter who gets the contract at the end of the day, that additional tool can be used day and night. So at night time, the argument is that you can't hear the dolphins because they are not vocalizing. Then you have camera and actual monitoring operators that are watching those , so the team is a bit bigger, you might have two MMO's, two PAM's and two camer imaging monitors etc so that we see everything. So we see it as additional support. There' also human error, during the day we might have somebody in the forecourt and a dolphin or whale has just passed 300m behind the vessel, again by having the 360 degrees camera and increasing the teames, it increases the probability of detection **IAP2- Liz McDaid (Green Connection)** So for me, I want to make sure that all of those mitigations, including the full crew are included in the Basic Assessment. The other issue is that those binoculars only pick up the mammals, what about the turtles and fish, plankton and all the other things that were mentioned in the scientific submissions to the court cases. We want to see those issues addressed in the assessment otherwise its meaningless. **Michelle (Seiche)** Yes, well I used to work offshore around 2009, and in those days I was the only one. But looking at South Africa today, and how my teams on board, the PAM operators, they really do have authority and independence. We QC the data ourselves before it goes to the client and from therethe reports go to PASA and they do look at the reports on a daily basis.Over the years, they environmental monitoring has increased and the officers rotate shifts so that they are not fatigued, they get a 12 hour rest and 12 hour work period.
m.	**IAP2- Liz McDaid (Green Connection)** So then this is my other question, if you are independent and if you want to convince the public that this is real. Then why can those daily MMO reports not be published your company website. These guys are going to be onboard and they've got data which is extremely useful in that it would give everybody peace of mind that there isnt any damage happening and that they are stopping the boat as required. So why cant the public have access to that information,so that we know things are being done right. Thats not asking for the Sonar data but I'm assuming TGS wouldn't have a problem with the monitoring data being made public. **GP Kriel** We are just doing the EIA at the moment, would you want to see previous MMO reports? **Michael (TGS)** I think it would be better for us to submit the data PASA and for them to publish it. **IAP2- Liz McDaid (Green Connection)**

EIMS

MINUTES OF MEETING

EIMS Ref	1520	Project Name	TGS RECONNAISSANCE BA

Item No	Item
	No, you are not going to get away with that. I want to know why its not possible because that the agency thats promoting oil and gas, we are saying why cant it be made public at the same time. **GP Kriel** We'll just have to see the logistics around it and see if it would be possible. On face value , it probably doesnt make sense. But we will have a look. **IAP2- Liz McDaid (Green Connection)** So, I am a member of the public and you are supposed to be an indepent EIA practioner, why are you not taking this as a request that you want to push rather than something that youre going to just ask them. **GP Kriel** Like I said, I agree with you at face value and its probably a good idea, but I'm not 100% sure what the logistics would be post EIA and the reporting requirements, whether there would be something else preventing us from doing that so I'm just make sure about that. **IAP2- Liz McDaid (Green Connection)** So the other thing is , if you have the thermal imaging camera then its safe to run at night? **Michelle (Sekibo)** Yes, you can do the survey at night because the thermal imaging allows visually monitor at night. The software has the automatic 500m mitigation zone which the area of biggest concern but it does look beyond it as far as possible. **IAP2- Liz McDaid (Green Connection)** Thats my other question, this 500m zone is very arbitary, science does show that the sound carries much further, so how will that be addressed. **GP Kriel** We are looking at the acoustic assessment as well, so we can adjust that zone based on the results of that assessment. That will feed back into the ecology report on the noise anf mitigation measures proposed.
e.	**IAP1 -Chris Harmer (ADR Fishing)** From your background information here, the location points are different to the location points on the map. So its a bit difficult to understand what is correct. **GP Kriel** Apologies for that, we will check that and update appropriately. The actual information on the map is the correct one,apologies for the error. **IAP2- Liz McDaid (Green Connection)** You're pushing everything to the Basic Assessment, but the point of us being here is so that we can review and comment on things before that. You dont have terms of reference for the specialists, similarly the BID needs updating, that shouldnt have to wait for the BAR. **IAP 3- Kim Day (Birdlife)**

EIMS	MINUTES OF MEETING		
EIMS Ref	1520	Project Name	TGS RECONNAISSANCE 8A

Item No	Item
	Infact, on this issue, its really important because we actually wrote and said could we please have the shapefile of the application area, we have not been responded to. Failing which we would need to plot the application area ourselves, if we could please just get that response. Obviously there's quite a few iterations that have to happen here, we've heard best practice environmental monitoring consultancy but as you said you still have to bid for the job. If Searcher gets the contract, are they appointing you or are they going to appoint somebody else, we dont really know. The monitoring equipment sounds like a really expensive product so they may go for somebody cheaper. So it becomes difficult to be able to say, unless we see the things you've included in a Best Practice document that everyone has to conform to for that particular contract. **GP Kriel** In terms of the equipment that was mentioned, we can have a look at writing that into the EMP as a spec which then becomes the terms of reference for whoever gets appointed. **Michelle (Seiche)** I have witnessed in Namibia a couple of years ago, where if a survey was taking place in December - January, that thethermal imaging cameras had to be an additional tool to cover the later migration of the humpback whales in that time of the year but if the survey was February to May, it wasnt necessarily required. **Andiswa Xuma** The email requesting a shapefile/kml of the application area was noted and responded to in the morning, apologies for the delayed response. Directions to the meeting venue were also sent to Ms McDaid.
a.	**IAP2- Liz McDaid (Green Connection)** What happens when there's bad whether during the survey? The thermal imaging might work but nothing else especially when there's fog which is common. **Michelle (Seiche)** The PAM operators and MMOs would be doing the monitoring, especially focussing on the PAM **IAP2- Liz McDaid (Green Connection)** Can you in your recommendations maybe make something for when its really high risk for marine fauna and the survey shouldnt happen at all? For particular whether conditions, the survey should be stopped. **Michelle (Seiche)** Yes, they watch the weather and stop the survey according to the conditions or move in a differentdirection away from the bad weather. **IAP3- Kim Day (Birdlife)** It would be quite good to see the marine cables on a map as well, just so we understand the extent or type of material it is made of. **GP Kriel** Yes we can include that in the BAR.
a.	**IAP4- Elaine Mills**

MINUTES OF MEETING

EIMS Ref	1520	Project Name	TGS RECONNAISSANCE BA

Item No	Item
	Sorry, I arrived late and you may have answered this question already. The Searcher application area seems quite similar to the TGS area, I didnt realize that there is a bidding process still underway, I actually thought that youve already been contracted and I understand why there is an overlap. So can you please just explain it again, because that was my main question. **GP Kriel** So there's two companies trying to position themselves to be able to do that survey for the companies that want that information So TGS and Searcher are applying for reconnaissance permits so it is two separate EIA processes. The TGS area is slightly longer that the Searcher area so we are going to be looking at the EIA for both projects. **IAP2- Liz McDaid (Green Connection)** Why didnt you do one EIA for both projects, save time and cost instead of us having to come to the meetings twice. **GP Kriel** The clients wanted the assessments to be done separately. **IAP4- Elaine Mills** They would be doing the seismic survey on behalf of a kruger company, is that correct? **GP Kriel** Its a multiclient survey, so basically they would survey that they applied for then sell that information to whoever is interested. Theres various license holders in that application area, these will be indicated on a map. **IAP2- Liz McDaid (Green Connection)** Can we get a copy of the reconnaissance application from PASA? **GP Kriel** I'm not 100% sure, I'll have to get back to you on that one.
4	**IAP2- Liz McDaid (Green Connection)** There's basically no jobs here. **GP Kriel** Yes, we are not promising the public jobs at this stage, we understand the skills required are very technical. **IAP2- Liz McDaid (Green Connection)** How do they detect baby turtles? **Michelle (Seiche)** What I can say is that the guys on board ensure that theres no additional light and night time other than what is required for health and safety. All crew on board get training on the Environmental permit conditions and EMP. The small fish and baby turtles are really difficult to spot, but anything that is sighted gets recorded, even jellyfish.

MINUTES OF MEETING

EIMS Ref	1520	Project Name	TGS RECONNAISSANCE BA

Item No	Item
	Michael (TGS) Its in our best interest to ensure that there are no non-conformances in a project, we shut down when we need to and communicating with the teams on board so that the response is inediate. In other places like Brazil, you get fined for every non-conformance so we try to ensure that international best practice is followed. **IAP2- Liz McDaid (Green Connection)** I just also want to say thank you for being in this meeting. **IAP3- Kim Day (Birdlife)** The application area seems small compared to all the other concession areas, how tempting is it for you to receive requests from other people to do more surveys? **Michael (TGS)** That block is approximately 52000 square kilometers, its massive. I think this is the only area we have interest in surveying. The chances that we will survey the entire area are pretty slim.
4.	**General** GP thanked everyone for attending and requested that IAPs must please advise if there's anyone who should be consulted or notified during this process.
5.	**Closure** The meeting was closed at 18:00.

'n Openbare vergadering is geskeduleer tydens die vooraansoekfase met die Belanghebbende en Geaffekteerde Partye (I&APs). Die doel van die vergadering was om die aanvanklike bekommernisse van die lede van die publiek en belangrike I&APs vas te lê. Tydens die openbare vergadering wat tussen 16:00 en 18:00 plaasgevind het, is 'n aanbieding van die projekbeskrywing, voorlopige impakassessering, projekspan en projektydraamwerke aan alle deelnemers van die vergadering deur Environmental Impact Management Services (EIMS) Pty (Ltd) gelewer. 'n Aanbieding is deur mnr GP Kriel van EIMS in Afrikaans gelewer. SEICHE het 'n aanbieding gelewer oor die omgewingsversagting wat tydens seismiese opnames in terme van die Marine Soogdier Waarnemer (MMO) en Visvlakteamptes (FLO) in Afrikaans uitgevoer is. Die aanbieding is deur mnr Rudian Bally gelewer. Nadat die aanbiedings afgelewer is, is 'n vraag- en antwoord sessie geopen waar deelnemers vrae gevra het of hul kommentaar oor die projek uitgespreek het. Die bywoningsregister is aangeheg as 'n aanhangsel tot hierdie dokument.

A Public Meeting was scheduled during the pre-application phase with the Interested and Affected Parties (I&APs). The aim of the meeting was to capture the initial concerns from the members of the public and key I&APs. During the public meeting which took place between 16h00 and 18h00, a presentation of the project description, preliminary impact assessment, project team and project timeframes was delivered to all attendees of the meeting by Environmental Impact Management Services (EIMS) Pty (Ltd). A presentation was delivered by Mr GP Kriel from EIMS in Afrikaans. SEICHE delivered a presentation on the environmental mitigation carried out during seismic surveys in terms of the Marine Mammal Observer (MMO) and Fishing Liaison Officer (FLO) in Afrikaans. The presentation was delivered by Mr Rudian Bally. After the presentations were delivered, a question and answer session was opened where attendees asked questions or expressed their comments regarding the project. The attendance register has been attached as an appendix to this document.

NOTULE/ *MINUTES*

Item No	Item
1.	Alle deelnemers is versoek om die bywoningsregister te onderteken soos hulle ingeskryf het. Aanbiedings van EIMS en SEICHE van die projekbeskrywing, aansoekproses en omgewingsversagtings tydens seismiese opname is gelewer volgens die agenda hierbo aan die vergaderinggangers. Daar is aangedui dat die vergadering opgeneem sou word vir die doeleindes van akkurate notule neem. Agtergrondinligtingsdokumente (in Engels, Afrikaans en isiXhosa), kommentaarvorms, registrasie, inligtingsuitdeelstukke en bywoningsregisters is by die vergadering beskikbaar gestel. Die deelnemers is aangemoedig om hul kommentaar en bekommernisse in te dien deur die kommentaarvorms in te vul wat verskaf word of deur kommentaar in te dien by die projek-e-posadres wat verskaf is. Daar is opgemerk dat alle deelnemers wat hul kontakbesonderhede verskaf het, by verstek geregistreer sal word op die I&AP-databasis wat deur EIMS gehandhaaf word. Na aanleiding van die aanbiedings is die vloer oopgemaak vir 'n bespreking en die deelnemers is aangemoedig om enige vrae of bekommernisse wat hulle oor die projek gehad het, op te stel. *All attendees were requested to sign the attendance register as they entered. Presentations from EIMS and SEICHE of the project description, application process and environmental mitigations during seismic survey were delivered as per the agenda above to the meeting attendees. It was indicated that the meeting would be recorded for the purposes of accurate minute taking. Background Information Documents (in English, Afrikaans and isiXhosa), comments forms, registration, information handouts and attendance registers, were made available at the meeting.* *The attendees were encouraged to submit their comments and concerns through filling in the comment forms provided or by submitting comments to the project email address provided. It was noted that all attendees who have provided their contact details would be registered by default on the I&AP database maintained by EIMS. Following the presentations, the floor was opened for a discussion and the attendees were encouraged to bring up any questions or concerns they had about the project.*
2.	Vrae en Antwoord/ *Questions and Answers*

In die eerste plek is ek teleurgestel dat vissers nie hulle teenwoordigheid toon nie, dat vissers nie kom en kom kyk waarin is ons gedompel nie. Ek doen navorsing op my eie en ek kyk waar die goed plaasgevind het, wat het daar al gebeur. En ek kyk na klomp goed. Ek kyk na klomp dinge. Die mooiste goed word vir ons hier gesê. In die eerste plek is ek bekommerd Ons het begin met Karpowerships. Hulle het meetings met gehou met die politicians Die politicians stel hulleself sommer voor. Hulle is die community-mense wat na die community luister. Ek gaan vir jou sê van Hervandaan af tot daar onder in Noord Kaap is vissers. Vissers is by die duisende wat afhanklik is van die see. Nou praat ek nie eens van die gemaakte vissers nie. Ek praat van die inheemse vissers hier, die tradisionele vissers, die vissers wat afhanklik is van die see, wat hulle bronne elke dag uit die see uit moet haal. Wat my baie bekommer, is dat Piet, Paul en Klaas kom nou en doen aansoek vir 'n permit. In die eerste plek was ons in die hof oor Searcher. Toe is die klag onwettig op die waters. Nou hoe gaan ons hierdie goed kan voorkom? Watter ooreenkoms ... Hoe weet ons tussen die twee maatskappye, Searcher en die ander maatskappy, hulle twee werk nie saam nie? Hoe gaan ons dit ooit weet? Baie mooi goed word vir ons afgespreel. Baie vissers ... Beloftes was al vir hulle gemaak oor baie goed. "Ons gaan dit vir julle gee, ons gaan daardie ..." Hier kan Government nie eens vir ons 'n reg gee nie. Ons mense moet dae en maande wag voor hulle 'n permit kan kry, en hulle kan nie see toe gaan nie, alhoewel hulle is vir

	jare afhanklik, en kan die mense om see toe te gaan, kan hulle nie gaan nie, want hulle permit is nie reg nie. Hier kom ander maatskappye. Ek wil my hart eintlik nou uitpraat. Inons landgaan derduisende billion Rande gaan verlore en jy kry nooit die antwoord waarmee is dit op pad nie. Is hierdie 'n gretigheid in ons land waar ons leiers wil hê, maak nie saak wie kom nie, solank hulle geld in die land kan stort dat daar al daardie biljoene wat verdwyn het dat hulle dit nie weet kan in nie. Die vissers het gesê in Port Alfred. "Nee, nee, nee." Die vissers het besluit die top ses van Government moet waai en ek wil vanaand net sê ek wil niemand dreig nie. Ek respekteer almal se werk wat hulle doen en almal moet werk, maar wat nou gaan gebeur, al die goed kan julle vir ons wys. Ek het gesê toe die muur hier gebou geword het, toe sê ons vir die mense: "Mense, is dit reg dat die muur ...?" Die muur was nog nie 'n jaar of twee nie, toe het ons erosie in Langebaan. Ons het nou nog nie 'n strand waar ons kan swem nie. Nou nog nie. Klippe lê net so hoog; kinders moet oor daardie klippe val as hulle wil gaan swem. Kinders wat miskien sonder toesig gaan. Mense se huise het op daardie strandwalle verspoel. Mense moet net sulke hoë mure bou wat op die strand bly om daar nog te kan inwoon. Was daar gebruik? Die mense se inheemse kennis. Die mense het geweet dat vis gaan verdwyn. Mense, ek weet nie watse navorsing mense nou nog moet kom by tradisionele vissers nie, want hulle is gebore met dit. Hulle het hier gewoon. Hulle het hier gebly. Ek kan nie verstaan nie dat mense nou nog sê: "Die gaan nie seekry en daardie gaan nie seekry nie." 'n Vis het 'n kop en 'n stert. Hy bly lê nie in 'n walletjie of op 'n hopie nie. 'n Vis beweeg. Vis beweeg all over. Mense moet agter die vis aangaan. Ons het die swakste, soos julle verlede keer gehoor het, die swakste snoekseisoen gehad. In die hof het die judge gesê, die judge het dit gesê dat: "Mense julle moet in ag neem, snoek is 'n tradisie vir Weskus vissers." Snoek kan nie netso verlore gaan nie. Dis die mense se inkomste. Net 'n voorbeeld: 12,5 kg kreef was vir 'n visser gegee. Dit was R2 500 word gewees vir 'n seboom. Nou sê julle vir my waarvan moet ons lewe? Hoekom kom hier permitte landwyd en suid, all over? Ek het al 'n klomp videos gekyk wat in ander lande gebruik, waar die goed plaasgevind het. Wat het daar gebeur? Hoekom is almal doodstil daaroor? Maar die tegnologie van vandag is baie goed. Ons kan lees en ons kan surf en ons kan Google. As ek nie kan Google nie, dan vat ek my kinders om te Google. Maar ons doen die goed om te kyk watter impakte het hierdie goed in ons oseane. Hierdie oseane, mense, rêrigwaar, ek kan net nie ... of die mense dit wil wegwens, maar solank wat ek lewe, sal ek daaroor praat. Hierdie see ... Ons is afhanklik van dit. Ons mense ... Jy kan nie 'n visserman 'n dokter maak nie, maar hulle maak nou dokters vissermanne en predikante is ook vissermanne, en God weet wie is almal vissermanne, maar die regte vissers word benadeel nou al vir jare en vir jare en ons gaan weg tot die bitter einde toe. Ons gaan weg om behoue te bly dat ons kinders ook nog ... ek het nou die dag vir my kind gesê: "Regtigwaar, jou oupa was 'n visserman, jou opagrootjie was 'n visserman." Weet jy ek het een aand, op 'n Vrydagaand, vier familielede het ek verloor op die see. Hoeveel mense van ons lê nie in die water nie? Hulle lyke lê daar. Wil Searcher net kom en kom boor sommer dwarsoor ons voorvaders en mense wat in die water lê? Hoekom kan ons tradisie nie in ag geneem word nie? Hoekom kan ons inheemse kennis nie in ag geneem word nie? Ons tradisie is om te bewe uit die see uit om ons nageslag ... Ons het reëls self gehad voordat DFFE gekom het, voordat almal gekom het. Ek het bakkie in Langebaan en gesê: "Niemand gaan besluit neem namens ons nie." DFFE gaan sit, die Parkeraad gaan sit saam met die vissers en ons gaan besluit hoe wil ons, ons reëls hê, want ons het al die jare toe DFFE nie daar was nie, toe die park nie daar was nie, het ons vissers reëls gehad. Julle gaan nie Sondag see toe nie, of julle gaan nie die naweke nie. Ons moet die bronne kans gee om ook te kan groei. En elke dag, al wat ek nog begeer, is dat vissers by massas moet optree, dat die mense kan sien. Die mense het nou nog nie ... Julle doen nou nog aansoek vir die permit. As ons, ons oë uitvee, is die boot op die water. Dan is dit te laat vir ons om dat nog te praat. Ons wil deel wees van die laaste ding wat gaan plaasvind op hierdie waters. Ek sê vir julle, elke dag kry ons info dit het in hierdie land gebeur, dit het in daardie land gebeur, hoeveel skade was in daardie land aangebring, hoeveel skade ... En as ek sien wat julle wys, raak my siel ontstoke. My hart raak seer om te dink daar gaan niks vir ons kinders oorbly nie. Op die oomblik wil ek dit sê, mense moet dit kan hoor dat

	ek dit sê, want ek wil nie skaam wees om dit te sê nie. Hier is te veel biljoene Rande verdwyn uit ons land uit, wat in amptenare se sakke sit en nou kan Piet, Paul en Klaas kan nou kom boor in die water. Kyk hoe stil is die water. Kyk hoe mooi is die water. Bitter mooi. Ek sê vir julle begin nou boor en gaan nou aan hier op die waters, julle sal sien hoe sterk ... Die see lewe mense. Die see lewe en die see gaan swaad wees as julle gaan boor in hom, as julle gaan whatever doen in dié seewater. As ek daardie bote sien dan raak ek bekommerd om te dink hier all of a sudden is en Langebaarn het so baie ... wat is die goed se naam? Seals. Orals skeur die mense nette, maar is gewoond in die water. Hulle vra so baie: "Kan julle nie 'n plan maak nie?" Hulle kan vir die mense permitte gee om al die seals uit die water uit te haal dat die mense 'n beter lewe kan hê en meer vis kan ... Die seals vreet al die voëls en die goed op. Daar is nou organisasies wat na die voëls kyk, daar is organisasies wat na die environmental kyk, daar is organisasies wat alles kyk. Daar is organisasies wat nou saam bymekaar gekom het want ons gaan hierdie stryd aansê. En réligwaar mense, enige een kan sê net wat hy wil. Vir visse kan jy sê net wat jy wil. Die vissers is gebore. Hulle het nie bloed in hulle are nie. Seewater is in hulle are. Jy kan hoor hoe sê die vissermanne daar is seewater in hulle hulle are. En 'n visserman is die laagste betaalde mens wat op God se aarde is. Hulle lewe van die hand tot die mond, maar het nog nooit gegaan vir ander werk nie. Hulle wil see wees, want dit is hulle tradisie. En vir tradisie, ons inheemse kinders, ons customary right. Mense, moet dit asseblief nie van ons weg afvat nie, want as ons customary right van ons weg afgeneem word, dan kan ons oorlog verklaar. En ek wil niemand dreig nie. Ek wil sê hoe my hart voel, want ons is vissers, jare. Hoekom moet politicians namens ons besluit? Ons het besluit in Port Alfred ... Hier sit die chief ook. Ons het besluit niemand wat wil kom praat, moet met 'n koning praat of met 'n chief praat nie, Ons praat almal saam, want ons is die visservolk. Die chief gaan nie besluit nie, die king gaan nie besluit nie, niemand gaan besluit nie. Ons gaan almal saam besluit. Dit is wat ons besluit het. En ons gaan volgende maand, gaan ons al die provinsies hier in Saldanha bymekaar hê dat ons weer ons strategy kan uitwerk, want soos mense nou ... die permit, maar daardie tyd moet die permit ingaan en die permit moet daardie tyd ingaan. Ek sê die Minister wat toelaat dat hierdie permitte gegee word vir ander mense, die Minister moet vir verantwoording geroep word. Die Minister kan nie na ons vissers toe kom nie, na ons vissersgemeenskappe wie die meeste geraak word nie. Hulle kan nie na ons toe kom nie. Hulle stuur mense na ons toe. Hier was nou hierdie week 'n hele week 'n konferensie in die Kaap. Wie was genooi? Nie vissers nie. Wie was genooi? Mense wat namens vissers wil gaan praat. Nooit, ook as wat ek lewe en wat ek vanaand hier staan nie ... hoeveelste is vandag? Die 31ste Augustus 2022, wil ek vanaand vir julle sê sdank as wat ek lewe en ek glo God gaan my laat lewe, want ek moet sorg vir my nageslag. My man het al die jare, het nie eens 'n reg gekry nie. Nou, ek het nou 'n reg. Ek kan dit nie eens gebruik nie. Ek het tinders, maar ek het foster kinders maar ek kyk na ander mense se kinders wat sorg vir my gemeenskap, met daardie bietjie geld wat ons uit die see uit kry. So, los ons visse, los ons waters, los ons alles. Gaan boor daar waar die mense wil hê moet geboor word. Maar hoekom wil alle oorsese lande wil nou hier kom boor? Jy kan mos self weet dit is 'n geldmaak storie, want mense wil geld maak om vir ons ... as hier nou die blokkie wat hulle hier uitgesit het ... Mense ek sê vir julle vanaand, die blokkie wat uitgesit is, dit het gebeur in Langebaan. Toe die mense begin werk met TFC, die plase en goed, toe word dit vir ons gesê: "Julle mag nie meer daar vis nie." En as hulle vir ons gesê het: "Jy mag nie meer daar vis nie", dan mag jy nie meer daar vis nie, want dan is dit nou 'n oortreding. Hoekom is dit so baie poaching hier in ons area? Dit het nooit plaasgevind nie, maar jy kan nie die mense kwalik neem nie, want die mense word van die een seewater af weggetoot na die ander seewater toe, want die ontwikkeling kom nou daar en as die ontwikkeling langs die water kom, dan sien daardie mense wat daar langs die water bly, hulle sien daardie stuk water sommer ook. Nou wat moet nou nog van ons afgeval word? Ek is vanaand baie, baie emosioneel. As ek dink ek is 'n vrou. Ek bakkel vir my vissers in Langebaan. Ek is 'n vrou. Ek moet vir hulle bakkei. Ek moet vir hulle sê: "Dit moet gedoen word, daardie moet gedoen word." Ek soek net die viesers se ondersteuning dat ek mense kan sien. Baiekaar dan gaan julle hier weg, dan sê

	julle: "Ja, daar was net 'n paar mense. Die meeste wat hier gewees het, was ons wat dit aangebied het. Die vissers was nie daar nie." Dan moet die mense mos nou die indruk kry die vissers stel nie belang nie. Maar oral waar julle al gegaan het, wil ek vanaand vir julle die vraag vra: "Was daar al 'n visser wat gesê het, ja, kom met die ontwikkeling?" As 'n visser dit gesê het, dan is dit 'n politician, of gemaak het of hy 'n visser is, maar hy is nie 'n visser nie, baie dankie. *I was wondering now, should I ask questions, should I speak, should I say something? But as I'm talking about here now, I'm very emotional because it seems to me even though we're saying what, too. First of all, I am disappointed that fishermen do not show their presence, that fishermen do not come and see what we are immersed in. I do research on my own and I look where the stuff took place, what has already happened there. And I'm looking at bunch of stuff. I look at a lot of things. The most beautiful things are said to us here. First of all, I'm worried We started with Korporerships. They held meetings first with the politicians The politicians just introduce themselves. They are the community people who listen to the community. I'm going to tell you from here to down there in Northern Cape are fishermen. Fishermen are by the thousands who depend on the sea. Now I'm not even talking about the mode fishermen. I'm talking about the indigenous fishermen here, the traditional fishermen, the fisherman who depend on the sea, who have to take their resources out of the sea every day. What worries me a lot is that Piet, Paul and Klaas are coming now and applying for a permit. First of all, we were in court over Searcher. Then the charge went illegal on the waters. Now how are we going to be able to prevent this stuff? What deal ... How do we know between the two companies, Searcher and the other company, the two of them don't work together? How are we ever going to know that? A lot of nice things are being spun off for us. Many fishermen... Promises had already been made to them about a lot of good. "We're going to give it to you, we're going to give it..." Here, Government cannot even give us a right. Our people have to wait days and months before they can get a permit, and they can't go to sea, even though they've been dependent for years, and know the people to go to sea, they can't go because their permit isn't right. Here come other companies. I actually want to speak my heart out right now. In our country, thousands of billion Rands are lost and you never get the answer to which it is heading. Is this an eagerness in our country where we want leaders, no matter who comes, as long as they can pour money into the country that there are all these billions that have disappeared that they can't put it back in. The fishermen said in Port Alfred, "No, no, no." The fishermen have decided the top six of Government should blow and I just want to say tonight I don't want to threaten anyone. I respect everyone's work that they do and everyone has to work, but what's going to happen now, all that stuff you can show us. I said when the wall got built here, then we said to the people, "Folks, is it right that the wall...?" The wall hasn't been a year or two, then we have erosion in Longeboon. We don't have a beach where we can swim. Not yet. Stones lay just as high; kids have to fall over those pebbles if they want to go swimming. Children who may be going unsupervised. People's homes washed up on those beach walls. People just have to build walls like that that stay on the beach to still live there. Was there use? The people's indigenous knowledge. The people knew that fish were going to disappear. Folks, I don't know what kind of research people have yet to get at traditional fishermen because they were born with it. They lived here. They stayed here. I can't understand people still saying, "It's not going to hurt and that's not going to hurt." A fish has a head and a tail. He doesn't stay lying in a little room or on a pile. A fish moves. Fish move all over. People need to go after the fish. We had the weakest, as you heard last time, the worst pike season in court, the Judge said, the Judge said that: "People you have to consider, pike is a tradition for West Coast fishermen." Pike can't be lost just like that. It's the people's income. Just an example: 12.5 kg of crayfish were given to a fisherman. It was worth R2 500 for a season. Now you're telling me what should we live on? Why come here permits nationwide and south, all over? I've watched a bunch of videos that use in other countries, where the stuff took place. What happened there? Why is everyone dead silent about it? But today's technology is very good. We can read and we can surf and we can Google. If I can't Google, then I take my kids to Google. But we do the stuff to see

Item No	Item
	what impacts this stuff has in our oceans. These oceans, folks, really, I just can't... whether the people wish it away, but as long as I'm alive, I'll talk about it. This sea... We depend on it. Our people... You can't make a fisherman a doctor, but they now make doctors fishermen and ministers are also fishermen, and God knows who are all fishermen, but the real fishermen have been harmed for years and for years now and for years and we're going to fight to the bitter end. We're going to fight to keep our kids from being too... the other day I said to my child, "Really, your grandfather was a fisherman, your great grandfather was a fisherman." You know I last one night, on a Friday night, four family members I lost on the ocean. How many people of ours are not lying in the water? Their bodies lay there. *Does Searcher just want to come and drill all over our ancestors and people lying in the water? Why can't our tradition be taken into account? Why can't our indigenous knowledge be taken into account? Our tradition is to live from the sea out to our descendants... We had rules ourselves before DFFE came, before everyone came I got into a fight in Langebaan and said, "Nobody's going to make a decision on our behalf." DFFE sits down, the Parks Board sits down with the fishermen and we're going to decide how do we want, we want rules, because we have all these years when DFFE wasn't there, when the park wasn't there, we had fishing rules. You don't go to the sea on Sundays, or you don't go on the weekends. We need to give the sources a chance to grow as well. And every day, all I still desire is for fishermen to act at masses, for the people to see. The people haven't yet... You are still applying for the permit. If we wipe our eyes, the boat is on the water. Then it's too late for us to talk that yet. We want to be part of the last thing that's going to take place on these waters. I tell you, every day we get info it happened in this country, it happened in that country, how much damage was done in that country, how much damage... And when I see what you're showing, my soul becomes incensed. My heart aches to think there is nothing left for our children. Right now I want to say it, people need to be able to hear me say it because I don't want to be ashamed to say it. There are too many billions of Rands disappearing from our country, sitting in officials' pockets and now Pict, Pond and Kleos can now come and drill into the water. See how still the water is. See how beautiful the water is. Bitterly beautiful. I tell you guys start drilling now and move on here on the waters now, you'll see how strong... The sea lives people.* *The sea is alive and the sea is going to be angry if you're going to drill into him, if you're going to do whatever in this sea water. When I see those boats then I get worried about thinking here all of a sudden is and Langebaan has so many... What's the good's name? Seals. Everywhere the people tear nets, but are accustomed in the water. They ask so much, "Can't you make a plan?" They can give the people permits to take all the seals out of the water that the people can have a better life and more fish... The seals eat up all the birds and the stuff. There are organizations that look at the birds, there are organizations that look at the environment, there are organizations that watch everything. There are organizations that have come together now because we are going to take up this fight. And truly, folks, anyone can say whatever he wants. For fish, you can say whatever you want. The fishermen were born. They don't have blood in their veins. Sea water is in their veins. You can hear the fishermen saying there is seawater in their veins. And a fisherman is the lowest paid human being on God's earth. They live from hand to mouth, but have never gone for other work. They will be sea, because that is their tradition. And for tradition, our indigenous children, we have a right. Folks, please don't take it away from us, because if we're taken from our way, then we can declare war. And I don't want to threaten anyone. I want to say how my heart feels, because we're fishermen, years. Why should we decide on our behalf? We decided in Port Alfred... Here the Chief also sits. We decided no one who wanted to come and talk should talk to a king or talk to a chief. We all talk together because we are the fishing people. The Chief isn't going to decide, the King isn't going to decide, nobody's going to decide. We're all going to decide together. That's what we decided. And we're going next month, we're going to have all the provinces here in Saldanha together that we can work out our strategy again, because like people now... the permit, but that time the permit has to go in and the permit has to go in that time.*

Item No	Item
	I say the Minister who allows these permits to be given to other people, the Minister must be held to account. The Minister cannot come to our fishermen, to our fishing communities who are most affected. They can't come to us. They send people to us. There has been a conference in the Cape for a whole week this week. Who was invited? Not fishermen. Who was invited? People who want to speak on behalf of fishermen. Never, ever than I'm alive and what I'm standing here tonight... How many are today? The 31st of August 2022, I want to tell you tonight as long as I live and I believe God is going to let me live because I have to take care of my descendants. My husband has all these years, didn't even get a right. Well, I have a right now. I can't even use it. I have kids, but I have foster kids but I look at other people's kids taking care of my community, with that little bit of money we get out of the ocean. So, release our fish, loosen our waters, leave us everything. Go drill there where the people want it to be drilled. But why do all overseas countries want to come and drill here now? You can tell it's a money-making story because people want to make money to tell us... If here now the blocks they put out here... People I tell you tonight, the blocks that were evicted, it happened in Langebaan. When the people started working with TFC, the forms and stuff, then we were told, "You're not allowed to fish there anymore." And if they said to us, "Thou shalt not fish there anymore," then you are no longer allowed to fish there, because then now it is an offense. Why is it so much poaching here in our area? It never happened, but you can't blame the people because the people are pushed away from one seawater to the other seawater, because the development is getting there now and if the development comes next to the water, then those people who live next to the water own that piece of water as well. Now what else needs to be taken from us? I'm very, very emotional tonight. If I think I'm a woman. I fight for my fishermen in Langebaan. I'm a woman. I have to fight for them. I have to tell them, "This must be done, this must be done." I'm just looking for the fishermen's support that I can see people. A lot of times you leave here, you say, "yes, there were only a few people. The most that was here was us who offered it. The fishermen weren't there." Then the people must now get the impression that the fishermen are not interested. But everywhere you've gone, I want to ask you the question tonight: "Has there been a fisherman who said, yes, come with the development?" If a fisherman said that, then it's a good idea, or pretended to be a fisherman, but he's not a fisherman. Thank you very much. **CSP Kriel** Ek dink dit is alles belangrike dinge wat gesê moet word, en ek is baie bly jy het dit gesê, Mevrou, want ek dink die omgewing waarbinne hierdie storie gebeur, is nie net vir die olie en gas nie. Dit gebeur binne-in die viswaters. Dit gebeur binne-in die Suid-Afrikaanse waters. So, daar is 'n hele klomp dinge wat gebeur en 'n klomp goed wat in ag geneem moet word. So, dit is spesifiek hoekom ons wil kyk na die sosiale aspek van dit ook, want hierdie is 'n sosio-ekonomiese storie, is dit nie? En daar is kulturele goed. Dit is hoekom ons na dit ook wil kyk. So, dit is hoekom ons vir Wouter-hulle gekry het om te kom kyk wat julle te sê het en al daardie tipe goed. So, ek wil vir jou baie dankie sê vir daardie goed. Ons verstaan dat daar 'n geskiedenis is van mense wat nie reg behandel is nie. Ons verstaan al daardie goed, en ons verstaan dat ons praat van die omgewing, praat ons nie net van die visse en die goed nie. Ons praat van die mense ook. Ons praat van die kulturele omgewing en goed ook. So, dit is vir ons baie belangrik om daardie goed in ag te neem, en dit is belangrik dat julle hierdie goed sê ook, jy weet, want partykeer dink 'n mens, jy weet, wetenskaplik maar jy vergeet van die sosiale goed, of jy weet, wat ook al. So, dit is baie belangrik dat julle hierdie goed vir ons sê. So, ons gaan hierdie goed opneem. Die sosiale mense gaan ook daarna kyk. Hulle gaan daarna luister. Wouter-hulle gaan ook na julle luister en al daardie tipe goed. Ons verstaan dat daar permitte is wat ge-issue word vir die visse. Ons verstaan daardie tipe goed. Ongelukkig het ons nie rêrig vreeslik met dit te doen nie. Ons gaan dalk nie direk daarmee kan werk nie. Ons werk maar meer met die permitte in terme van die omgewingsgoed. So, daar is nie rêrig te veel wat ons kan sê oor die viserypermitte en goed nie, maar dat ons weet dat daar goed gebeur wat nie altyd reg is nie. Alright. Ons verstaan, jy weet, dat julle vissersgronde is baie belangrik vir julle, dat die tradisionele visvangs baie belangrik is. Dit is deel van julle kultuur. Dit is deel van julle manswees. So, dit

Item No	Item
	is spesifiek hoekom ons ook wil kyk na daardie visseryegedeeltes, waar julle visvang, hoe julle visvang, watse visse julle vang en of hierdie storie dan gaan inmeng met daardie, sodat as dit inmeng, dat 'n mens kan kyk van te veel inmeng, 'n mens moet dit liewers nie doen nie. Of dit gaan dalk gladnie inmeng met watse tipe vis en waar julle dit vang nie, of wat ook al. Dit is nou die twee uiterstes. Daar is heelwaarskynlik 'n middelgrond in die middelkant, maar soos ek sê, ons is nog besig om na daardie tipe goed te kyk, maar dit is belangrik dat julle vir ons gesê het dit daar daardie tipe goed is. So, in terme van die ander lande en waar die geld heen verhuyn. So, wat ek kan sê is dat hierdie is 'n redelike tegniese besigheid. Dit is 'n redelike duur besigheid om dit te doen. So, dit het redelik geld nodig, en dit het redelike kennis en goed nodig, en redelike duur bote en daardie goed. So, ek dink dit is maar meestal hoekom die ouens van oorsee af kom, is omdat hulle het daardie kundigheid en daardie geld, of watookal, en dan kom kyk hulle vir ons wat is daardie in ons eie waters. So, hierdie is basies net reconnaissance permit op hierdie stadium. Dit is nie noodwendig 'n eksplorasie en produksie en daardie tipe goed nie, maar ons weet dat dit wel tot dit kan lei en dit kan tot op daardie vlak kom. So, dit is baie belangrik om daardie tipe goed in ag te neem. Wanneer hulle by daardie produksie gedeelte kom, gaan hulle verseker moet kyk na dit. Hulle gaan verseker moet kyk na watter gedeelte van daardie geld gaan hier gebruik word, watter gedeelte van die geld gaan uit die land uit gaan, gaan dit uitgevoer word, gaan ons dit hier verwerk, wat gaan ons doen met daardie goed as dit op daardie stadium kom. So, en dan is dit belangrik om seker te maak dat Suid-Afrika bevoordeel word daardeur as dit op daardie stadium kom, maar daar is nog baie water wat onder die brug moet loop. Hulle moet nog eers goedkeuring kry vir hierdie storie, en dit is ook nie verseker nie. So, baie dankie vir jou insette. Ek waardeer dit rêrig baie. As daar enigiets anders is wat ek uitgemis het ... Ja, as daar spesifieke dinge is dan kan ons mekkien kom kyk. Ek dink dit is hoekom dit vir ons belangrik gaan wees om terug te kom en dan van ons spesialiste en goed saam te bring, sodat hulle kan ... Soos wat ek gesê het, hulle gaan dan vir julle sê wat hulle gekry het, en op daardie stadium gaan dit dan, as ons terugkom met ons verslag, is dit belangrik om te kom kyk wat weet julle. Julle, soos wat julle gesê het, julle is die manne op die see. Julle weet meer partykeer, baie keer, meeste van die kere eintlik, nè? So, julle ken die situasie, julle leef daarso, julle weet wat aangaan. So, dan ons daardie kennis ook in ag neem. So, ons wil dit rêrig kom doen. Ons wil nie kom wegkruip van dit af nie. *I think these are all important things that need to be said, and I'm really glad you said that, Madam, because I think the environment in which this story is happening is not just for the oil and gas. This happens inside the fishing waters. It happens inside the South African waters. So, there's a whole bunch of things that happen and a bunch of stuff that needs to be taken into account. So, that's specifically why we want to look at the social aspect of it as well, because this is a socioeconomic story, isn't it? And there's cultural stuff. That's why we want to look at that too. So, that's why we got Wouter-them to come and see what you guys have to say and all that type of stuff. So, I want to thank you so much for that stuff. We understand that there is a history of people who have not been treated right. We understand all that stuff, and we understand that we're talking about the environment, we're not just talking about the fish and the stuff. We're talking about the people too. We're talking about the cultural environment and stuff too. So, it's really important for us to take that stuff into account, and it's important that you say this stuff also, you know, because sometimes one thinks, you know, scientifically but you forget about the social stuff, or you know, whatever. So, it's very important that you guys tell us this stuff. So, we're going to take this stuff up. The social people are going to look at it too. They're going to listen to it. Wouter-they're going to listen to you guys and all that type of stuff too. We understand that there are permits that are being issued for the fish. We understand that type of stuff. Unfortunately, we don't really have anything to do with that. We may not be able to work directly with it. We're just working more with the permits in terms of the environmental stuff. So, there's not really too much we can say about the fisheries permits and stuff, but that we know that things happen that aren't always right. Alright. We understand, you know, that your fishing grounds are very important to you, that the traditional fishing is very important.*

Item No	Item
	it is part of your culture it is part of your humanity. So, that's specifically why we also want to look at those fisheries sections, where you fish, how you fish, what fish you catch and whether this story is going to interfere with that, so that if it interferes, that one can look at from interfering too much, one should rather not do it. Or it might not interfere at all with what type of fish and where you catch it, or whatever. Those are the two extremes now. There's probably a middle ground in the middle side, but as I say, we're still looking at that type of stuff, but it's important that you guys told us that there's that type of stuff. *So, in terms of the other countries and where the money goes away. So, what I can say is that this is a fairly technical business. It's a pretty expensive business to do this. So, it needs a fair amount of money, and it needs reasonable knowledge and stuff, and pretty expensive boats and that stuff. So, I think that's just mostly why the guys come from overseas is because they have that expertise and that money, or whatever, and then they come and see us what's that in our own waters. So, this is basically just reconnaissance permit at this point. It's not necessarily an exploration and production and that type of stuff, but we know that it can lead to it and it can get to that level. So, it's very important to consider that type of stuff. When they get to that production part, they're definitely going to have to look at it. They're going to have to look at what portion of that money is going to be used here, what portion of the money is going to go out of the country, is it going to be exported, are we going to process it here, what are we going to do with that stuff when it comes to that point. So, and then it is important to make sure that South Africa is benefited by it when it comes to that point, but there is still a lot of water that needs to go under the bridge. They have yet to get approval for this story, nor is it assured. So, thank you so much for your input. I really appreciate it. If there's anything else I've missed out... Yes, if there are specific things then maybe we can come and see. I think that's why it's going to be important for us to come back and then bring some of our specialists and stuff, so they can... Like what I said, they're going to tell you what they got, and at that point it's going to, when we come back with our report, it's important to come and see what do you know. You, as you said, you are the people on the sea. You know more sometimes, a lot of times, most of the times actually, huh? So, you know the situation, your live thereso, you know what's going on. So, then we take that knowledge into account as well. So, we really want to come and do that. We don't want to come and hide from it.*
b.	**Cornelita Mostert** Vag vir jare vir die vissers van Saldanha. Soos jy nou streeds gehoor het, dit is ons lewensbestaan en dit is ons geboorteregt. Ons is gebore langt die see en ons lewe tot vandag toe ... My pa (sy pa is al dood), ons lewe vir jare uit die see uit. Soos my kollega tereg gesê het, dit is ons begraafplaas en ek hoor wat jy sê, hoe jy antwoord en dit blyk my dat daar geen respek aan ons getoon word nie. In die eerste plek is, toe julle aansoek doen, of besig is met die aansoek, moes julle eers met die departement gepraat het, want ek dink ek kan nie net 'n ding begin nie. Daar is 'n vorm wat ek moet aansoek voor doen om vir hierdie projek aansoek te doen en soos dit vir my blyk en I dink, het julle klaar met Departement van Omgewingsake gesit en hulle het klaar vir julle die go-ahead gegee en nou is hulle te bang om na ons toe te kom om self met ons te kom praat, want hulle weet watse antwoorde en vrae hulle gaan kry. Nommer 2 is, dit blyk nie dat 'n vis 500 meter hier van af ... Wil julle stack om die soogdiere kans te gee. Ek dink jy kom 100 000 meter ver aan, dan hoor daardie whale en dan hoor daardie vis hier kom 'n gedruis. "Ek moet vlug vir my lewe, want ek gaan dood." Dit is exactly wat gaan gebeur, want enige gedruis maak daardie vis dat hy 'n veilige plek kry. Hier het ons 'n Witstompneus gebroei hier oorkant die palletjies. Waar is dit vandag? Toe Portnet gebou word, en toe Saldanha Staal gebou word, toe is daar slee wat afgaan as dit gelip word en as gevolg van Portnet se rooi dusi het onse Witstompneus getrek. Hier is nie een Witstompneus hier by die palletjies nie. Ons mense kon tot daar gevoel het om die Witstompneus te kry. Geensins vandag nie. Mense kom van oorsee af en hulle bronne is klaar die hel in gedra. Nou sien hulle daar is nie meer piek nie en hulle wil die Suid-Afrikaanse waters kom oorvat. Soos

Item No	Item
	ek voel, ek is 'n Suid-Afrikaanse vrou, vir my moet gerespek word. So, as Engeland of wie hier inkom, moet daar moets en moenies, want nou sit 'n Suid-Afrikaanse vrou in die gevangenis in Thailand en haar ma moet daar bly net om vir haar te kan sien. Sou die geld op word of minder word, moet sy maak dat sy in Suid-Afrika kom. Daar was geen versagting vir daardie vrou nie. Nou dink die buiteland hulle gaan ons vis kom destroy laat dit disappear en daar is geen respek vir ons nie. Ons eet hier uit van Omega 3 is baie belangrik vir ons liggame. Daarom gaan vang ons maar net die vis. Ons families gaan vang die vis en ons is vroue. Ek, myself is teen die drilling van die kus. Ek is a boat owner en ek gaan bemark my vis self wat my crew vir my inbring. So, ek sê straight nee. Die mense dink totally niks van ons nie. As DEF kan geld kry, of Omgewingsake kan geld kry, dan bly hulle sjuut, want ons moenie worry nie. En lank genoeg gaan die gemors aan. So, ek wil vir jou pleidooi vra vanmiddag: gaan sê vir daardie mense wat vir julle go-ahead gegee het om aan te gaan, te kom praat, vorms in te stuur, sê hulle moet na ons toe kom. Ons soek nie vir julle hier nie. Ek is een. Ek weet nie wat die vloer sê nie, maar ek 'n visservrou soek nie vir julle hier nie. Soos ons gesê het: "Voetsek Karpowership, voetsek", moes hy gegaan het, want die hof het beslis die gemeenskap se belange dra hy op die hand, want dit is die mense se tradisie. Dit is die mense se lewensbestaan en dit is die mense se kos. Dan het ek drie vrae om te vra. Wie gaan vir ons vissermanne werk gee? Die beleid van Suid-Afrika sê as jy 45 is, kan jy nie meer aansoek doen vir werk nie. Punt nommer 2: Wie gaan ons huishoudings in stand hou, terwyl die see vir ons 'n bron gee wat ons kan uit lewe, eet en ons dienste kan betaal. Nommer 3 is: Wie gaan ons kinders universiteite toe stuur? Ons sukkel already met daardie bietjie, maar as ons tafel gesit het en beplan 'n raam, dan kan ons na Sea Harvest toe gaan en sê: "Ek is 'n visservrou. Hier is my kind se rapport en sy wil verder gaan studeer. Is daar dan nie 'n helpende hand nie?" Ons kan nie na Omgewingsake toe gaan nie. Ons kan nie na die Departement toe gaan nie. Hy gaan vir ons straight sê hy kan nie vir ons help nie. En dit moet ons as die vissers in ag neem dat sy sulke vergaderings moet ons almal saamstaan, want dit is nie net vir my boot wat ek vaq nie. Dit is nie net vir my tafel nie, maar dit is vir die breë gemeenskap. So, my pleidooi is, ons soek regtig nie veel al daardie voorleggings. Ek weet nie of julle gukyk het nie maar in die voorleggings, Solene het ek gesien seismic. Maar ek het nou weer daar gesien sels. So, wat wil dit vir my sê? TGS is Shell, BP, Total Garage. Hulle change net. Dit gaan nou amper, Chief soos dit in die ... as u 'n werk het (hoe sê 'n mens?) 'n sub-kontrak, dan change die volgende maand die naam. Die sub-kontrak naam, want u was 'n slegte betaler, nou gee jy 'n ander naam. Só dit is hoe dié ding sirkuleer. Ons is nie dom nie. Hier is van ons wat kan lees en skryf. Hier is van ons wat Engels kan verstaan, sodat ons plat visserman kan verstaan waaroor dit hier gaan. So, go away, please. I thank you. *Fight for the fishermen of Saldanha for years. As you've heard by now, this is our livelihood and it's our customary law. We were born by the sea and we live to this day... My father (his father is already dead), we live out of the sea for years. As my colleague rightly said, this is our graveyard and I hear what you say, how you answer and it seems to me that no respect is shown to us. First of all, when you apply, or are busy with the application, you should have talked to the department first, because I guess I can't just start a thing. There is a form that I have to apply for to apply for this project and as it seems and sounds to me, you have finished sitting with Department of Environmental Affairs and they have already given you the go-ahead and now they are too scared to come to us to come and talk to us themselves, because they know what answers and questions they're going to get.* *Number 2 is, it doesn't appear that a fish 500 yards from here... Want to stack to give the mammals a chance. I think you arrive 200,000 yards away, then hear that whale and then that fish here hears a roar. "I have to flee for my life because I'm going to die." That's exactly what's going to happen, because any roar makes that fish find a safe place. Here we have a White Stump nose brewed here across from the pellets. Where is it today? When Portnet was being built, and when Saldanha Steel was being built, then there were beatings that went off when tipped and because of Portnet's red dust we pulled White Stump nose. There's not a single White Stump nose here at the pellets. Our people could have rowed up to there*

Item No	Item
	to get the White Stump nose. By no means today. People are coming from overseas and their resources are already hell-bent. Now they see that there is no more space and they want to come and take over the South African waters. As I feel, I am a South African woman, for me I must be respected. So, if England or whoever comes in here, there must be do's and don'ts, because now a South African woman is sitting in Thailand and her mother has to stay there just to be able to see her. Should the money run out or dwindle, she must make sure that she comes to South Africa. There was no mitigation for that woman. Now the outback thinks they're going to come and destroy our fish and there's no respect for us. We eat out here of Omega 3 is very important for our bodies. That's why we're just going to catch the fish. Our families go catch the fish and we are women. I, myself am against the drilling of the coast. I'm a boat owner and I'm going to market my fish myself bringing my crew in for me. So, I say straight no. The people totally don't think anything of us. If DEF can get money, or Environmental Affairs can get money, then they stay, because we shouldn't worry. And long enough the mess goes on. So, I want to ask for your plea this afternoon: go tell those people who gave you go-ahead to move on, come and talk, send in forms, tell them to come to us. We're not looking for you here. I am one. I don't know what the floor says, but I'm not looking for you here. As we said, "Voertsek Kanpowership, voertsek", he should have gone, because the court ruled the community's interests he had on hand, because that is the people's tradition. It's the people's livelihood and it's the people's food. *Then I have three questions to ask. Who is going to give us fishermen jobs? The policy of South Africa says if you are 45 you can no longer apply for jobs. Point number 2: Who is going to maintain our households, while the sea gives us a resource that we can get out of living, eating and paying for our services. Number 3 is: Who is going to send our children to universities? We're already struggling with that bit, but if we've set the table and plan a frame, then we can go to Sea Harvest and say, "I'm a fisherwoman. Here is my child's report and she wants to study further. Isn't there a helping hand then?" We can't go to Environmental Affairs. We can't go to the Department. He's going to tell us straight he can't help us. And this we as the fishermen must take into account that with such adjournments we must all stand together, for it is not only for my boat that I fight. It's not just table for me, but it's for the community at large. So, my plea is, we're really not looking for all those vaateggings. I don't know if you guys looked but in the submissions, Solene I saw seismic. But I've seen it again now. So what does that want to tell me? TGS is Shell, BP, Total Garage. They just change. It almost goes now, Chief as it does in the... if you have a job (how does one say?) a sub-contract, then change the name the following month. The sub-contract name, because you were a bad payer, now you give a different name. That's how this thing circulates. We're not stupid. Here are some of us who can read and write. Here are some of us who can understand English so our fint fisherman can understand what it's all about here. So, go away, please. I thank you.* **GP Kriel** Baie dankie vir jou kommentaar. Dit is belangrik dat jy dit gesê het. Ek gaan dit opneem. Ons gaan dit in ons notule sit en dit gaan dan by die Departement uitkom. Ek wil net 100% duidelik seker maak, Ons het nie vooraf gekoukus met 'n departement nie. Ons is 'n onafhanklike maatskappy. Ons belang is om seker te maak dat die omgewing beskerm word, en dit sluit die mense in die omgewing in, en die see ook. So, ons belang is om seker te maak dat dit gebeur.en ons wil nie kom koukus en agteraf wees nie. TGS is die ouens wat aansoek gedoen het. Ja, hulle doen aansoek want hulle wil kyk wat watse data is daar, watse inligting is daar en watse bronne daar is, en waar hulle is. Daardie inligting gaan dan gebruik word deur die lisensieblok houers. So, dit gaan dan deur die, wie-ever daardie area se goed besit, en 'n groter gedeelte daarvan is Total, of TotalEnergies soos wat 'n mens dit nou deesdae noem, Azinam. Shell van die gedeeltes, al daardie ouens. So, daardie inligting gaan op die ou einde deur daardie ouens gebruik word, en partykeer verkoop hulle die lisensieblokke onder mekaar, of hulle neem dit oor van een na die ander een toe. So, ek wil nie kom wegsteek en kom sê dat ons hierdie tipe goed nie van weet nie, maar

Item No	Item
	dit is daar. En ons dink nie julle is stupid nie. Ons weet julle kan hierdie goed doen. Julle het access tot die inligting ... Ons het nie agteraf gewerk nie en ons kom nie met 'n lang ding aan nie. Soos ek gesê het, ja, daar is mense wat wil goed doen. Daar is mense wat sekere inligting nodig het. Daar is 'n gat in die data en dit is hoekom hulle 'n voorstel gehad het om daardie spesifieke area te target. Ons is aangestel omdat hulle 'n voorstel het. Daardie voorstel het hulle gesê: "Okei, ons wil hierdie ding kom doen, maar ons mag nie net dit kom doen soos wat ons wil nie. Ons kan nie net kom en kom gemors maak soos wat ons wil en net oor die mense se visserbote ry soos wat ons wil en daardie tipe goed nie." Jy moet eers daar 'n wetlike proses gaan. As gevolg van die konstitusie, as gevolg van al daardie ander wette, is daar lyste en is daar ander wette wat bymekaar gestel is en die Omgewingsbestuurswet is een van daardie en daar is spesifieke maniere, daar is spesifieke wette waaraan ons moet voldoen. Ons kan nie ook net gaan en 'n proses gaan doen soos wat ons wil nie. Ons moet eers 'n sekere eerste stap doen in daardie proses en dit is om te gaan kyk watse goed is daar. Dan moet ons die aansoekvorm instuur om dit af te skop. Dan moet ons ons verslag bymekaar stel, ons moet dit aan die publiek bekendstel. So, dit is die wetlike proses en as ons nie aan dit voldoen nie, soos wat julle weet, dit het met Searcher gebeur en van daardie goed. Daar was sekere prosesgedeeltes wat nie reg was nie. So, ons wil probeer op 'n eerbare manier wil ons na julle toe kom en sê: "Luister hierdie is wat ons weet. Wat weet julle?" En ons wil nie goed kom wegsteek nie. Dit is nie die idee van die hele storie nie. Ons wil nie met allerhande tierlantyntjies en goed kom nie. *Thank you so much for your comments. It's important that you said that. I'm going to record it We're going to put it in our minutes and it's going to get to the Department then. I just want to make 100% clear. We didn't pre-caucus with a department. We are an independent company. Our interest is to make sure that the environment is protected, and that includes the people in the area, and the sea as well. So, our interest is to make sure that happens and we don't want to come caucus and be backward. TGS are the guys who applied. Yes, they apply because they want to see what data is there, what information is there and what sources there are, and where they are. That information is then going to be used by the license block holders. So, it then goes through the, who-ever owns that area's stuff, and a larger portion of it is Total, or TotalEnergies as one now calls it these days, Anlnam. Shell of the sections, all those guys. So, that information is going to end up being used by those guys, and sometimes they sell the license blocks among themselves, or they take it over from one to the other. So, I don't want to come and hide and say that we don't know this type of stuff about, but it's there. And we don't think you guys are stupid. We know you can do this stuff. You guys have access to the information...,* *Ons didn't work backwards and we don't come up with a long thing. Like I said, yes, there are people who want to do well. There are people who need certain information. There's a hole in the data and that's why they had a proposal to target that particular area. We were hired because they have a proposal. That suggestion they said, "Okay, we want to come and do this thing, but we're not allowed to just come and do it the way we want. We can't just come and make noise the way we want and just ride over the people's fishing boats like we want and that type of stuff." You have to go through a legal process first. Because of the constitution, because of all those other laws, there are lists and there are other laws that have been put together and the Environmental Management Act is one of those and there are specific ways, there are specific laws that we have to abide by. We can't just go and do a process the way we want. We have to take a certain first step in that process first and that is to go and see what's good there. Then we have to send in the application form to kick it off. Then we have to put our report together, we have to release it to the public. So, that's the legal process and if we don't comply with it, like you know, it happened with Searcher and some of that stuff. There were certain process passages that weren't right. So, we want to try in an honorable way we want to come to you and say, "Listen this is what we know. What do you*

	know?" And we don't want to come and hide well. That's not the idea of the whole story. We don't want to come up with all kinds of trappings and stuff.
c.	**Chief Maart** Baie dankie programleier. Ek gaan hoofsaaklik kommentaar lewer en ek dink ek het vyf kommentaar areas wat ek wil aanspreek. Die een gaan natuurlik oor NEMA en die regering se rol. Die tweede area wat ek wil dek, gaan spesifiek oor die akoestiese impak. Die derde een gaan oor die ekonomiese impak en die vierde een is eintlik 'n boodskap wat ek wil stuur aan hierdie teenstrydige denkstrome wat in ons gemeenskap bestaan van mense wat sê maar die ding het vir ons 'n ekonomiese voordeel. Ek het 'n boodskap vir hulle en dan laastens wil ek graag praat oor ons kultuurerfenis en natuurlik ons sosiale impak wat ons sien op hierdie goed gaan gebeur. Kan ek op die eerste onderwerp-area gou fokus. Die regering en NEMA? My belangrike stelling wat ek wil maak is dat die regering ons faal in die oorsigrol wat hulle ingevolge NEMA het.en ook ingevolge ons demokratiese Grondwet en ek noem dit nie eintlik 'n demokratiese Grondwet nie. Ek noem dit eintlik a demokratiese Wet, want dit is 'n klomp duiwels wat daar bo sit en hulle soek net geld, want as u nou die Bybel reg lees, dan sê die Bybel dat die Here sê Hy staat net een God toenoor die grote Here. Hy sê jy kan nie God en mammon aanbid nie en mammon is die geldgod en dit is presies waar ons regering lê. Hulle is net agter die geld aan. Ons almal weet die tripple bottom line vir sustainable development het 'n tripple bottom line wat sê dit moet die drie P's wees: People, Planet en Profit. Vir die regering gaan dit net oor die laaste P, Profit. Hulle worry nie oor die mense nie. Hulle worry ook nie oor die omgewing nie. En dit is vir ons 'n sterk soort van aanval op ons gemeenskap se rol wat ons speel om, veronderstel om die land te regeer, want hulle sê mos demokrasie is eintlik 'n bottom up approach waar jy die mense moet regeer, maar die mense word nie raadgeslen nie. Ek meen hulle het die pragtige wet NEMA, maar NEMA word deliberlief nie geïmplementeer nie. Hulle kyk nie nie daarna nie. Ek wil dit amper stel, en ek gaan dit nou ook op 'n ander manier ook vir julle stel is dat ek agterkom is dat daar is 'n tipe van 'n collusion As julle kyk na hierdie werkswinkel wat hulle verlede week gehou het daar in die Kaapse Konfensiesentrum, is dit departemente: Omgewingsake, Departement Landbou en dan natuurlik ook Visserye, en dan natuurlik ook die Mynbou minister, Minister Mantashe. En eintlik kan 'n mens sien daar is 'n tipe van 'n collusion wat daar plaasvind, en ons is besig, ek meen ons verskillende omgewingsorganisasies en ons tradisionele owerhede, ons is besig om saam te werk om te kyk om riglyne te formuleer teen Minister Mantashe. Hy moet krimineel aangekla word. Net soos hulle nou met hierdie collusion wat nou plaasgevind het met die State Capture nè, is Transnet se CEO is krimineel aangekla. Minister Mantashe moet op dieselfde wyse aangekla word, want hoe kan hy die gemeenskap elke keer agterstoe skuif en net ter wille van 'n bietjie profyt wat hulle maak. Ek is seker daarvan. Hy het 'n bietjie bande daarbinne. Nou bring dit my by die volgende collusion. Ek is nog altyd by my eerste punt. Bloot die feit dat TGS en Searcher altwee vir EIMS aanstel as hulle omgewingskonsultant, sê dit vir my hulle is ook besig om te collude. As julle kyk na die areas ook, hoe naby aanmekaar lê hulle. Blikkemmer. Dink hulle nou ons is nou so dom nè. Daar is 'n ander tipe collusion wat plaasvind en dit is nie tot voordeel van die gemeenskap nie. Goed, dan net om antie Soelien se vraag te beantwoord netnou oor, of om te sê ek stem saam met haar stellings. Dit is nie konings en ministers en chiefs wat moet besluit oor die mense se grond en oor die mense se water nie. Dit is iets wat onaanvaarbaar is en dit is hoekom ons tans die Traditional Khoisan Leadership Act beveg, want die Traditional Khoisan Leadership Act laat baie mag oor aan jou chief om te kan besluit wat in sy area mag gebeur en ons stem nie daarmee saam nie, want die tyd van Jan van Riebeeck het ons mense sommer vir 'n knipmes groot stukke grond gaan verkoop, ensovoorts. Ons wil nie

Item No	Item
	weer 'n herhaling daarvan hé nie. Die mense, die tradisionele gemeenskap, en veral die visergemeenskap moet die ultimate sê hê oor wat gebeur in hulle waters. So, dan is ek klaar oor daardie regering en NEMA. Goed, my tweede onderwerp-area gaan spesifiek oor die akoestiese impak. U het dit ook daar uitgewys dat die soogdiere, selfs plankton, wat aan die onderpunt van die voedselketting is, gaan negatief beïnvloed word, en enige impak weet ons vir 'n feit as dit in die natuur plaasvind, dit kan nie weer omgekeer word nie. In Engels sê hulle it is irreversible. So, daar moet glad nie eers 'n impak gewees het nie. Die oomblik as julle besef daar gaan 'n impak wees, dan moet julle vir julleself sê: "Ons stop net hierso." Nè? Ja, daardie akoestiese impak, as ek dit reg gelees het, want ek doen 'n bietjie navorsing daaroor, dan sê hulle die menslike oor, nè, kan net vir vyf minute teen 120 desibels aanhoudend, net vir vyf minute, aanraan daarna luistar voordat hy heeltemal doof word, nè? Nou wil julle vir my sê dat diere wat soveel meer gehoorsensitiwiteit het as 'n mens, nou nie daardie impak sal kan voel nie. Wat die snaakste van alles is vir my, in julle dokumentasie praat julle van dat menslike aktiwiteit moet nie binne-in 'n 20 kilometer radius van hierdie knal wat julle afstuur met daardie boot, nè ... 'n Mens kan nie in 20 kilometer radius daarvan af kom nie, maar julle praat van 'n 500 meter radius vir diere. Hoe verstaan julle dit? As diere wat 'n baie groter gehoorsensitiwiteit het, hoekom kan hulle net 'n 500 meter ... dan wil julle mos eintlik ons diere, wil ek amper sê, vrek maak, nè? Julle wil hulle uit ons waters uitjaag, want ons weet die broei en die migrasiepatrone van onse seediere gaan definitief ... Daar is nie eers 'n vraag daaroor nie. Dit gaan definitief versteur word. En as ons kyk na watter knal die ou gunnetjie wat daar agter uitgeskiet word, hulle sê hy kan tot op 240 desibels kan hy geraas maak. Nou as jy dit vat, en ek vat byvoorbeeld net die mediaan een van 145 desibels (onthou die mens kan op 120 desibels vir vyf minute luister en dan word hy doof) ... Kom ek vat maar net die mediaan van 145 desibels. Onthou dit is 300 keer harder as 120 desibels. Driehonderd keer groter. So, ek meen hoe kan diere dit hou? So, julle wil ons diere uitroei. Ek praat derdens oor die ekonomiese impak. Ons kleinskaalse vissers is afhanklik van die kreef, snoek en ander vis wat in ons areas is om 'n bestaan te voer. Die ekonomiese impak is selfs groter as ons na die pelagiese vissersbedryf gaan, want as julle vat meer as 12 000 gesinne in hierdie area waar julle nou wil hierdie seismiese toetse doen, is afhanklik van die pelagiese vissersbedryf. Twaalfduisend gesinne nè? Twaalfduisend gesinne is baie. Nou kom mense, en ek wil nou eintlik gekom het by hierdie een waar die denkstrome verwerp wat sê daar is bepaalde ekonomiese voordele vir ons daarin as daar vir olie en gas geboor word. Ek sê nee, nè. Die een wat dit sê, ek meen vat sommer die boodskap huistoe en sê vir hulle hy moenie kom nonsens met ons praat nie, want ons weet almal daar is geen ekonomiese voordeel nie, want wat gebeur is, dat ons die een ... Ek was nog steeds by die ekonomiese impak. Die een ekonomie moet nou doodgaan ter wille van 'n ander ekonomie wat gebou word. En die wêreld beweeg weg van fossielbrandstof sê. Ek weet nie waarom Manasshe en hierdie mense so aangaan en nog steeds wil hê daar moet vir fossielbrandstowwe gedril word nie, want waarvoor is hierdie seismiese toetse? Om te kyk of hulle olie en gas kan kry. So, die wêreld beweeg daarvan weg omdat ons besef dat die impak op jou omgewing en op jou klimaatsverandering baie, baie groot en negatief is. En ek wil laastens by hierdie ekonomiese impak gou net hierdie studie aanhaal. In 2013 het Bloomberg 'n studie gedoen van die tuna-vangste (ek het dit vanoggend raakgelees) in Namibië se waters nadat die olie en die gasbedryf daar toegetree het. En op 'n jaar-tot-jaar grondslag, het die tuna-vangste eksponensieël afgeneem. Nie eers inkrementeel nie, dit is eksponensieël, want in 2011 het hulle 4 000 ton tuna gevang. In 2012, net 'n jaar later, 1 800 ton. Is dit 'n impak, of is dit nie 'n impak nie? Dit is 'n enorme impak. In 2013, net 650 ton. Vanaf 4 046 ton in 2011 tot 650 ton in 2013. Mense, asseblief, stop hierdie nonsens. Ons kan dit nie bekostig nie. Ek wil afsluit met die sosiale- en natuurlik ook die kulturele-erfenis impak. Ons het dit al herhaaldelik keer gesê, maar ek gaan dit weer sê ter wille van die rekord vir TGS ook dat die oseaan is vir ons 'n kosbare

	en religieuse bron van lewe, en vanuit 'n kulturele oogpunt het ons nog al die tyd in harmonie saam met ons see en met ons natuur gelewe. Wat ons gegis het, wat jy uithaal, sit jy weer terug. Moenie uithaal en verwag die see gaan nie kom terugvat nie. Antie Soelaa het dit só mooi gedemonstreer toe hierdie Bacher-bote hier inkom en die see hier kom dieper maak om daardie muur te bou, toe kry ons daardie vloed in Langebaan. Ons het nie eers meer 'n kaslyn waar ons lekker mee kan loop nie, en dit was ons mooiste kuststrook. Ek meen daardie impak alleen, wys vir ons dat moenie met die natuur mors nie. Ek meen, ons het byvoorbeeld ook 'n kultuur gehad en ons spesifieke stam waaruit ek kom, die Kogahwa, het met skape en met beeste geboer, maar ons het jaggemaak op bokke, maar ons was baie versigtig om dragtige ooie te wil doodmaak, nè, want ons het gevoel daar moet 'n kultuur, daar moet 'n ketting voortgesit word, en jy kan nie die ketting daar versteur nie, want dan het ons nie môre, oormôre weer kos nie. Dié regering keer hierdie goed, goed, maar julle kom haal uit die see uit, julle versteur die hele seelewe met hierdie seismiese toetse en dit is 'n boodskap wat ek vir TGS gee. Asseblief, moenie weer kom doen wat die Kolonialiste gedoen het in 1652 nie. Hulle het in 1652 onse grond by ons kom afvat, onse vee afgevat, ons doodgemaak. Daar was selfs 'n wet uitgevaardig wat die Khoi- en die San-mense gesien het … Dit is nou ons voorvaders, wat hulle, hulle gedefinieer het as vermin. In Engels is dit vermin, nè, as wilde diere. En ons het 'n prys op ons kop gehad. Vir 'n Boesman, as jy hom skiet, het jy £8 gekry, en as jy 'n Khoi skiet, dan kry jy £6. Hulle het ons uitgeroei. Nou, ons het nie nou weer nodig om met guns terug te bakkel nie, want ons het nie guns gehad nie. Ons bakkel nou deur die sosiale media. Ons bakkie deur middel van die webwerwe en maak seker ons stem word gehoor. Julle gaan ons nie weer van die see ook weer kom beroof nie, nè. Genoeg is genoeg. Ek wil afsluit met UNDRIP, die United Nations Declaration on the Rights of Indigenous People, wat deur die United Nations aanvaar is as 'n deklarasie oor die regte van inheemse bevolkingsgroepe, stel dit baie duidelik dat daar moet vier prosesse plaasvind voordat enige ontwikkeling in tradisionele vissersgemeenskappe of watter tradisionele volke ook daar bly, se gemeenskap of in hulle water, of op hulle grond kan gebeur, naamlik wat hulle noem Free, Prior en Informed Consent, nè. Dit is vier verskillende beginsels. Free, Prior, Informed en dan die laaste een is natuurlik om Consent te gee, of om Consent te weier. In hierdie geval sê ons namens die vissergemeenskap, namens ons inheemse gemeenskap, sê ons nee. Anders verbeg u daardie beginsel ook van die United Nations. Baie dankie. *Thank you very much program leader. I'm mainly going to comment and I think I have five comments that I want to address. One, of course, is about NEMA and the government's role. The second area I want to cover is specifically about the acoustic impact. The third one is about the economic impact and the fourth one is actually a message that I want to send to these conflicting currents of thought that exist in our community of people who say but the thing has an economic benefit for us. I have a message for them and then lastly I'd like to talk about our cultural heritage and of course our social impact that we see is going to happen on this stuff. Can I focus on the first topic area soon. The government and NEMA? My important statement that I want to make is that the government is failing us in the oversight role they have under NEMA and also under our democratic Constitution and I don't actually call it a democratic Constitution. I actually call it a democratic Law because it's a bunch of devils sitting up there and they're just looking for money, because if you read the Bible correctly now, then the Bible says the Lord says He sets only one God against the great Lord. He says you can't worship God and mammon and mammon is the money god and that's exactly where our government lies. They're just after the money. We all know the triple bottom line for sustainable development has a triple bottom line that says it should be the three P's: People, Planet and Profit. For the government, it's just about the last P, Profit. They don't worry about the people. They don't worry about the environment either.* *And it's a strong kind of attack on our community's role that we play in governing the country, because they say democracy is actually a bottom up approach where you have to govern the people, but the people don't get noticed. I think they have the beautiful law NEMA, but NEMA is definitely not*

	implemented. They don't look at it. I almost want to put it, and I'm going to put it to you guys in a different way now is that I'm noticing that there's a type of a collusion if you look at this workshop that they held last week there in the Cape Confluence Centre, three departments: Environmental Affairs, Department of Agriculture and then of course also Fisheries, and then of course the Mining Minister, Minister Mantashe. And actually one can see there's kind of a collusion taking place there, and we're busy, I think our various environmental organizations and our traditional authorities, we're working together to look to formulate complaints against Minister Mantashe. He should be criminally charged. Just as they do now with this collusion that has now taken place with the State Capture huh, Transnet's CEO has been criminally charged. Minister Mantashe should be charged in the same way, because how can he move the community backwards every time and just for the sake of a little profit they make. I'm sure of it. He's got some ties in there. *Now that brings me to the next collusion. I've always been at my first point. Simply the fact that TGS and Searcher both hire EIMS as their environmental consultant tells me they are also collude. If you look at the areas as well, how close together they are. Tin bucket. Now they think we're so stupid now huh. There is another type of collusion that takes place and it is not for the benefit of the community.* *Okay, then just to answer Aunt Soelten's question just now, or to say I agree with her statements. It is not kings and ministers and chiefs who must decide on the people's land and on the people's water. This is something that is unacceptable and that is why we are currently fighting the Traditional Khoisan Leadership Act, because the Traditional Khoisan Leadership Act leaves a lot of power to your chief to be able to decide what may happen in his area and we do not agree with that, because the time of Jan van Riebeeck our people just went to open up large pieces of land for a clipper, Etc. We don't want another repeat of it. The people, the traditional community, and especially the fishing community should have the ultimate say in what is happening in their waters. So, then I'm done with that government and NEMA.* *Okay, my second topic area is specifically about the acoustic impact. You also pointed it out there that the mammals, even plankton, which are at the lower end of the food chain, are going to be negatively affected, and any impact we know for a fact if it takes place in the wild, it can't be reversed again. In English, they say it's irreversible. So, there shouldn't have even been an impact at all. The moment you realize there's going to be an impact, you have to say to yourselves, "We're just stopping here." Huh? yes, that acoustic impact, if I read it right, because I do a little research on it, then they say the human ear, huh, can only listen to it for five minutes at 120 decibels continuously, just for five minutes, straight before he goes completely deaf, huh? Now you want to tell me that animals that have so much more hearing sensitivity than a human being will not be able to feel that impact now. Which is funniest of all to me, in your documentation you're talking about that human activity shouldn't be within a 20 kilometre radius of this bang you're sending off with that boat, huh... You can't get off it in a 20 kilometre radius, but you are talking about a 500 metre radius for animals. How do you guys understand that? As animals that have a much greater hearing sensitivity, why can they only have a 500 meter ... then you guys actually want to kill our animals, I'd almost say, huh? You want to chase them out of our waters, because we know the breeding and the migration patterns of our marine animals are definitely going to... There's not even a question about it. It's definitely going to be disturbed. And if we look at what bang the old gunnetjie shot out from behind, they say he can make up to 240 decibels he can make noise. Now if you take that, and I just take the median one of 145 decibels for example (remember man can listen for five minutes at 120 decibels and then he becomes deaf) ... Let me just take the median of 145 decibels. Remember this is 900 times harder than 120 decibels. Three hundred times bigger. So, I think how can animals keep it? So, you want to exterminate our animals.* *Thirdly, I'm talking about the economic impact. Our small-scale fishermen depend on the lobster, pike and other fish that are in our areas to make a living. The economic impact is even greater if we go to the pelagic fishing industry, because if you take more than 12 000 families in this area where you want to do*

Item No	Item
	these seismic tests now. It is dependent on the pelagic fishing industry. Twelve thousand families huh? Twelve thousand families are many. Now people come, and I actually want to get to this one where the currents of thought reject that say there are particular economic benefits for us in it if oil and gas are drilled. I say no, huh. The one who says that, I think just take the message home and tell them he shouldn't come and talk nonsense to us because we all know there's no economic benefit because what's happening is, that we're the one... I was still at the economic impact. One economy must now die for the sake of another economy being built. And the world is moving away from fossil fuel. I don't know why Mantoshe and these people are going on like this and still want fossil fuels to be dredged for, because what are these seismic tests for? To see if they can get oil and gas. So, the world is moving away from it because we realize that the impact on your environment and on your climate change is very, very big and negative. *And finally, to this economic impact, I just want to quote this study. In 2013, Bloomberg conducted a study of the tuna catches (I read it this morning) in Namibia's waters after the oil and gas industry stepped in there. And on a year-over-year basis, tuna catches have declined exponentially. Not even incrementally, it's exponential, because in 2011 they caught 4,000 tons of tuna. In 2012, just a year later, 2,800 tons. Is it an impact, or is it not an impact? It's an enormous impact. In 2013, just 650 tons. From 4 046 tons in 2011 to 650 tons in 2013. People, please, stop this nonsense. We can't afford that.* *want to conclude with the social and of course cultural-heritage impact. We have said this repeatedly, but I am going to say it again for the sake of the record for TGS also that the ocean is a precious and religious source of life for us, and from a cultural point of view we have lived all this time in harmony with our sea and with our nature. What we believed, what you take out, you put back again. Don't lash out and expect the sea isn't going to come back. Auntie Soekie demonstrated it so beautifully when these Bacher boats came in here and made the sea here deeper to build that wall, then we got that flood in Langebaan. We don't even have a coastline where we can have a good time walking with anymore, and it was our most beautiful coastal strip. I think that impact alone shows us that don't mess with nature. I mean, for example, we also had a culture and our particular tribe that I come from, the Kogelwa, farmed sheep and cattle, but we hunted goats, but we were very careful about wanting to kill pregnant ewes, huh, because we felt there had to be a culture, there had to be a chain continued, and you can't disturb the chain there, because then we don't have food again tomorrow, tomorrow. This government is stopping this stuff, all right, but you're coming out of the ocean, you're disturbing the whole marine life with these seismic tests and that's a message I'm giving TGS. Please, don't come back and do what the Colonialists did in 1652. They come to take our land from us in 1652, took our livestock, killed us. There was even a law enacted that the Khoi and the San people saw... it is now our ancestors, whom they, they defined as mutilated. In English, it was mutilated, huh, as wild animals. And we had a price on our head. For a Bushman, if you shoot him, you get £8, and if you shoot a Khoi, then you get £6. They exterminated us. Now, we don't need to fight back with favors anymore now because we didn't have favors. We are now fighting through the social media. We fight through the websites and make sure our voice is heard. You're not going to come and rob us of the sea again, huh. Enough is enough.* *I want to conclude with UNDRIP, the United Nations Declaration on the Rights of Indigenous People, which has been accepted by the United Nations as a declaration on the rights of indigenous peoples, makes it very clear that four processes must take place before any development in traditional fishing communities or whatever traditional peoples remain there, or in their waters, or can happen on their soil, namely what they call Free, Prior and Informed Consent, eh. These are four different principles. Free, Prior, Informed and then the last one is obviously to give Consent, or to refuse Consent. In this case, we are saying on behalf of the fishing community, on behalf of our indigenous community, we are saying no. Otherwise, you're taking that principle from the United Nations as well. Thanks a lot.*

Item No	Item
	GP Kriel
	Baie dankie Chief. Dit was 'n redelike gedetaileerde, mooi uiteengesitte gedeelte. Ja, in terme van NEMA, ja, dit is die Omgewingswet wat ons gebruik, dit is die Omgewingswet waarvolgens ons moet werk. Dit is wat Chief heel tereglik gesê het, dit is People, Planet and Profit. So, ons wil verseker, dit is verseker hoekom ons probeer kyk om die People, Planet en Profit-gedeelte daarvan na te kyk. Op hierdie stadium is dit die reconnaissance fase van die ding, weet, so, daar is nie vreeslik baie profit in hierdie projek vir die ouens wat dit kom doen nie. Die ouens wat dit hier kom doen op hierdie stadium, ja, hulle gaan data insamel maar dit gaan hulle baie geld kos om daardie data in te samel. Die idee is wel dat hulle dit dan kan verkoop maar dat daardie verkoop van die data dan wel een of ander tyd gaan gebruik moet word om die hulpbronne hierso te identifiseer en die hulpbronne hierso dan te kan gebruik. So, ons verstaan wat jy sê, ons stem saam met wat jy sê. Ek wil net sê dat ek kan ongelukkig nie praat van in terme van die collusion wat daar is tussen die departemente en goed nie, so graag as wat ek wil. In terme van die collusion tussen TGS en Searcher en EIMS, daar is geen collusion daar rerig nie. Ons is 'n diensverskaffer. Ons doen dienste vir daardie ouens maar ons doen nie dit sodat ons kan enige bevelfit daaruit kry, ons het nie shares in TGS of shares in Searcher nie, ons doen nie beter of ons wen nie daarvir as hulle beter doen nie, ons moet betaal word of hulle nou die goedkeuring kry of nie. So, ons is nie daarin om 'n grootskaalse uitbuiting van die omgewing te gaan doen en dan geld te maak daaruit nie. Ons is daar om te gaan kyk wat is die impak op die omgewing, is daardie impak bestuurbaar en kan ons seker maak dat die omgewing beskerm word daaruit. En onthou ons het 'n integriteit waarvolgens ons moet werk en ons moet seker maak dat ons volgens daardie kodes en goed werk. So, ons kan nie net willy nilly gaan doen nie. Ons weet daar is gevolge vir ons. Ons verstaan dat ons nie net kan gaan sê wat ons wil nie, ons moet kan, as ons 'n stelling maak, moet ons daardie stelling kan opvolg en ons moet dit kan staaf uit navorsing uit, interaksie met julle en verstaan hoe die omgewing werk en daardie tipe goed. So, daardie is vir ons baie belangrik en ons wil net seker maak dat daar geen dubbelsinnigheid is oor dit nie. In terme van die akoestiese impakte, ja 'n impak is ongelukkig soos wat ons in ons bedryf daarna kyk is 'n impak nie 'n swart en 'n wit ding nie. 'n Impak is 'n grys ding. So, as ek nou gaan hardloop en ek spring daar in die water, het ek 'n impak op die algae en ek spring op die water en goed maar ek roer nie al die algae uit nie. Verstaan? So, ek verstaan as ons elke dag as ons in ons lewens werk, het ons almal 'n impak op die omgewing en ek probeer nou nie TGS of Searcher of wat ookal se impak goedpraat nie, maar ek probeer sê dat 'n impak is nie noodwendig 'n doodskanaal vir die ding nie. So, dit is nie hoe ons na die impakte kyk nie, 'n impak is 'n grys storie en ons moet gaan kyk as hy swart is, as hy baie grys is, dan is dit 'n hoë impak en dan moet ons sê nee, ons kan nie dit doen nie. Maar as die impak neder aan wit is, dan kan 'n mens kyk, okay, luister is daardie impak ... Kan ons dit bestuur, kan ons seker maak dat ons hierdie ouens aanstel om te gaan kyk dat hulle nie as daar dalk 'n dolfyn of 'n haai of 'n vis of wat ookal in daardie omgewing aankom, dat 'n mens hulle kan beskerm nie, want die rede hoekom hulle dit afrit is sodat 'n mens daardie ding kan beskerm want mens weet as jy een walvis uithaal uit die voedselketting uit affekteer jy die hele voedselketting, verstaan? So, ons probeer daardie tipe goed inbou, jy weet, sodat ons dit probeer beskerm. So, ons verstaan dat 'n impak is hierdie vae begrip, maar ons probeer daardie impak kwantifiseer op 'n manier. Ons probeer 'n nommer in daardie impak sit sodat ons kan sê hierdie is hoog, hierdie is onaanvaarbaar of hierdie is laag, mens kan dit dalk bestuur, 'n mens kan daarna kyk. Ons hoef nie noodwendig oor dit saam te stem nie, maar ek probeer maar net vir julle verduidelik hoe ons daarna kyk. As julle saamstem daaroor is dit fine. Dit is presies hoe ons, jy weet, ek probeer vir julle ons proses gee daaroor. Dan ja, die klank is hard, die klank is duidelik hard en ons wil nie dit wegsteek nie. Ons moet verseker kom kyk na dit. So, dit is presies hoekom ons daardie modulering gedoen het, en of besig is om daardie modulering te doen vir hierdie ouens. Sodat ons kan kyk ookal as hierdie ouens hulle skip daar gaan vaar en hoe lank hulle daar gaan vaar en hoe gereeld hulle daar gaan vaar, watse,

Naam/Nr	Item
	hoe lank en hoe vér en hoe groot gaan daardie klankgolf wees, met ander woorde watse frekwensie gaan hy wees, watse dier kan hore dan hoor of nie, hoe vér gaan hy trek en hoe hard gaan hy wees verder van die skip af, nader aan die skip, al daardie tipe goed. En dan kan 'n mens begin kyk na die veiligheidsones en kyk na is daardie veiligheidsone genoeg? Is dit nie, moet ons dit verder net los of nie want partykeer word die klank harder so verder hy gaan afhangende van die see bodem, al daardie tipe goed. So, ons het gevra dat al daardie ouens na daardie goed kyk. So, ek stem saam dit is hard, mens moet daarna kyk. 'n Ander ding om te onthou is mens kan nie direk die klank wat in die water gebeur en die klank wat in lug soos hierdie is, kan 'n mens nie met mekaar vergelyk nie. Die klank is op ander frekwensies, is laer frekwensies so hy kan dalk verder gaan, maar hy gaan dalk nie altyd ... As 'n mens sê 240 desibels op land en op see is dit dalk 'n ander ding. So, ons moet daardie verskil ook gaan kyk en verskillende diere luister op verskillende maniere na daardie tipe goed. So, ons het gevra dat daardie ouens ook dan gaan kyk wat die impak van daardie verskillende goed is. Dan in terme van die menslike aktiwiteite binne-in die 20 kilometer sone en die 500 meter sone. Die rede vir daardie twee sones is verskillend van mekaar af, so gewoonlik in die industrie wat hulle doen is, die 20 kilometer sone is om seker te maak ... Onthou soos wat ons gesê het daardie bote het goed wat ten minste 10 kilometer partykeer agter hulle aanvrek en in hierdie geval het hulle gesê dit gaan 8 kilometer wees. Jy weet, so, partykeer is dit lang goed en vir daardie bote om om te draai, dit vat hom 'n goeie 20 of 30 kilometer om om te draai. Hy kan nie net besluit hy gaan nou 'n u-turn maak nie. So, daardie draaisone en goed is om seker te maak dat as daar ander bote in daardie omgewing is, dat hulle nie oor daardie bote ry nie en dat hulle nie die vissermanne seermaak nie. Dit is hoekom hierdie ouens met die infrarooi op die bote sit en kyk is daar ander skepe wat hy gaan seermaak? Miskien het die ou nie 'n AIS nie en al daardie tipe goed en dan moet hulle daardie tyn kan draai. So, dit gaan nie oor die hardheid van die geraas nie, dit gaan nie oor daardie tipe goed nie. Die 500 meter sone is gewoonlik die industrie se standaard op 'n bare minimum om te kyk as die klank so hard is, hoe ver gaan hy trek en gewoonlik op daardie gedeelte bo, begin die klank afneem na 'n punt toe wat die diere dit kan hanteer. Dit sê nog steeds dat dit nie hard is nie. So, ek wil dit net duidelik stel. Daardie klanke kan 'n mens vér hoor, maar ons 'n klank vér te hoor en aan in platvloerse Afrikaans, jou alie af te skrik vir die ding en dan weg te gaan, is twee verskillende goed en daar is sekere ... 'n mens noem dit threshold shifts wat hulle na kyk. So, hulle kyk watse afwyking gaan die dier hê en wat sê die ouens met die dik brille en wit jaasies oor hoe wyk daardie diere af van hulle grond, van waar hulle eet, van wat hulle doen so ons probeer kyk na daardie verskillende afwykings. Ja, so ons verstaan dat dit die visserye en vissermanne regtig afhanklik is van daardie areas, ons weet dat hierdie is bietjie dieper gronde, so, dit is agter daardie visserybedryf se ring fence area, maar ons verstaan dat daar nogsteeds mense is wat uitgaan soontoe en dat hulle afhanklik is van daardie area en daar is mense wat afhanklik is. So, ons wil rêrig nie op dit kom trap en kom sê dat dit nie belangrik is nie. Dit is regtig, dit is vir ons belangrik en ons wil daarna kyk. Die ekonomiese voordeel. Ja, so ons kan op hierdie stadium nie weesllik praat oor die ekonomiese voordele van hierdie projek self nie. Hierdie projek self gaan op hierdie stadium nie vir Suid-Afrika 'n ekonomiese voordeel hê nie, maar as ons net kyk na die identifisering en hierdie potensiële toekomstige gebruik van die goed is daar miskien 'n ekonomiese voordeel. Hoe daardie voordeel dan gaan versprei word in Suid-Afrika en hoe hy gaan gebruik word in Suid-Afrika, daardie is ook nog op in die lug en ons kan ook nie rêrig sê hoe dit gaan gebeur nie. Wat die ouens daarmee gaan doen en wat die situasie gaan wees, is op hierdie stadium moeilik om te sê. Dit gaan afhang van 'n klomp goed, van watse bron daar is, is dit gas, is dit olie, is daar niks, is daar iets anders wat hulle kry dalk? Jy weet daardie tipe goed. So, 'n mens kan nie op hierdie stadium enigiets sê oor die ekonomiese voordeel nie, maar wel die belangrike ding om in ag te neem as 'n mens na daardie tipe goed wil kyk en as 'n mens nou net na hulpbron identifisering kyk en 'n mens vergeet nou vir 'n klein gedeelte van die ander goed is dat 'n mens nie hierdie goed nou doen nie gaan jy nie later die hulpbron kan identifiseer en kyk of jy dit kan gebruik as deel van ons transition of as deel van ons energie mix of ons deel van daardie tipe goed nie. So, hierdie

EIMS | Omgewingsimpakbestuur

NOTULE VAN VERGADERING/ *MINUTES OF MEETING*

EIMS Verw./ *EIMS Ref*	1520	Projek Naam/ *Project Name*	TGS VERKENNING BA/ *TGS RECONNAISSANCE BA*

Item No	Item
	is, as ons praat van die water wat onder die brug moet loop, hierdie is deel van die water wat onder die brug moet loop voordat hulle daardie hulpbron kan identifiseer. So, ek probeer maar net die proses verduidelik. Ons keur dit nie goed nie, maar ons sê dit is deel van die ekonomiese goed wat hulle moet doen voor die tyd. So, dit gebeur natuurlik nie in isolasie nie, dit gebeur binne-in omgewing en dit gebeur binne-in die visserybedryf en dit is hoekom 'n mens deur die EAI proses moet gaan om te kyk wat daardie impak is en of daar genoegsame voordele uit die projek gaan kom om dit dan te kan goedkeur. En dan ja, ons stem saam, rêrig ons is bewus daarvan dat dit julle kultuur is, dat dit belangrik is vir julle, dat dit julle lewenswyse is en ons is bewus van die free and prior informed consent. Ons werk soveel as moontlik volgens dit. Ons weet dat die wetgewing in die land nie altyd ooreenstem soos wat dit dalk moet nie. Ons neem dit in ag, maar ten spyte van dit probeer ons nogsteeds by julle uitkom, ons probeer by die gemeenskappe uitkom om te kom hoor wat hulle te sê het en ons wil dit as 'n sleuteldeel van ons proses insluit. Dit is vir ons baie belangrik om dit deel te maak. So, alhoewel daar nog baie goed gedoen moet word om dit in Suid-Afrika op 'n baie beter manier in te sluit en goed, is daar op hierdie stadium is die wetlike proses hierdie NEMA publieke deelnameproses waar daar in alle wetgewing publieke-deelname prosesse is. So, ons erken dit. Ons weet dat daar byvoorbeeld ander ouens is wat kyk na hierdie, na breër prentjies, byvoorbeeld ek weet nie of julle gesien het van Mnr Pedro Garcia en goed nie, maar hy het ook sy idees. So, ek dink daar is baie wat 'n mens kan gaan leer by hom en ek dink daar is baie goeie idees wat uit daardie goed uitkom. Ek dink daarna moet ook gekyk word. So, ons het met hom ook gaan gesels en gehoor wat hy te sê het en dink ons as 'n bedryf kan baie by dit leer en by julle leer oor die praat van daardie goed. *Thank you so much Chief. It was a fairly detailed, nicely laid out section. Yes, in terms of NEMA, yes, it's the Environmental Act that we use, it's the Environmental Act that we have to work under. That's what Chief quite rightly said, it's People, Planet and Profit. So, we want to assure, that's certainly why we're trying to look at the People, Planet and Profit portion of it. At this point, it's the reconnaissance phase of the thing, you know, so, there's not an awful lot of profit in this project for the guys who come to do it. The guys who come here are doing it at this point, yes, they're going to collect data but it's going to cost them a lot of money to collect that data. The idea is that they can then sell it but that that sale of the data will then have to be used at some point to identify the resources here and then use the resources here. So, we understand what you're saying, we agree with what you're saying. I just want to say that unfortunately I can't speak of in terms of the collusion that's there between the departments and stuff, as much as I want. In terms of the collusion between TGS and Searcher and EIMS, there is no collusion there. We are a service provider. We do services for those guys but we don't do it so we can get any benefit out of it, we don't have shares in TGS or shares in Searcher, we don't do better or we don't win from it if they do better, we have to get paid whether they get the approval or not.* *So, we're not in it to go do a large-scale exploitation of the environment and then make money from it. We're there to go and see what's the impact on the environment, is that impact manageable and we can make sure that the environment is protected from it. And remember we have an integrity that we have to work towards and we have to make sure that we work according to those codes and stuff. So, we can't just go do willy nilly. We know there are consequences for us. We understand that we can't just go and say whatever we want, we have to be able to, if we make a statement, we have to be able to follow up on that statement and we have to be able to substantiate that from research, interact with you guys and understand how the environment works and that type of stuff. So, that's really important to us and we just want to make sure that there's no ambiguity about it. In terms of the acoustic impacts, yes an impact is unfortunate as we look at it in our industry is an impact not a black and a white thing. An impact is a grey thing. So, if I'm going to run now and I jump into the water there, I have an impact on the algae and I jump on the water and stuff but I don't eradicate all the algae. Understand? So, I understand if we work in our lives every day, we all have an impact on the environment and I'm not trying to condone TGS or*

Item No	Item
	Searcher or whatever's impact right now, but I'm trying to say that an impact isn't necessarily a death channel for that thing. So, that's not how we look at the impacts, an impact is a grey story and we have to go and see if he's black, if he's very grey, then it's high impact and then we have to say no, we can't do that. But if the impact is closer to white, then one can look, okay, listening is that impact... Can we manage it, we can make sure that we hire these guys to go and see that if maybe there's a dolphin or a shark or a fish or whatever is arriving in that area, that one can protect them because the reason they put it off is so that one can protect that thing because you know if you take one whale out of the food chain you're affecting the whole food chain, understood? So, we're trying to build that type of stuff in, you know, so we're trying to protect it. So, we understand that impact is this vague understanding, but we're trying to quantify that impact in a way. We're trying to put a number in that impact so we can say this is high, this is inadmissible or this is low, one might be able to manage it, one could look at it. *We don't necessarily have to agree on that, but I'm just trying to explain to you guys how we look at it. If you guys agree on that, that's fine. That's exactly how we, you know, I'm trying to give you our process on that. Then yes, the sound is loud, the sound is clearly loud and we don't want to hide it. We certainly need to come and see it. So, that's exactly why we did that modulation, and whether we're doing that modulation for these guys. So we can watch okay if these guys are going to sail their ship there and how long they're going to sail there and how often they're going to sail there, whatse, how long and how far and how big is that sound wave going to be, in other words what frequency is he going to be, what animal can hear him then or not, how far he's going to pull and how hard he's going to be further from the ship, closer to the ship, all that type of stuff. And then one can start looking at the safety zones and look at is that safety zone enough? Isn't it, should we just leave it alone or not because sometimes the sound gets louder so further it goes depending on the ocean bottom, all that type of stuff. So, we asked that all those guys look at that stuff. So, I agree it's loud, one has to look at it. Another thing to remember is one cannot directly compare the sound that happens in the water and the sound that is in air like this, one cannot compare. The sound is at other frequencies, is lower frequencies so he might be able to go further, but he might not always go... If one says 240 decibels on land and at sea that might be another thing. So, we have to go and look at that difference as well and different animals listen to that type of stuff in different ways. So, we asked that those guys also then go and see what the impact of that different stuff is.* *Then in terms of the human activities inside the 20 kilometer zone and the 500 meter zone. The reason for those two zones is different from each other, so usually in the industry what they do is, the 20 kilometer zone is to make sure... Remember as we said those boats have stuff that pulls behind them at least 10 kilometres and in this case they said it was going to be 8 kilometres. You know, so, sometimes it's long stuff and for those boats to turn around, it takes him a good 20 or 30 miles to turn around. He can't just decide he's going to make a u-turn now. So, that turning zone and stuff is making sure that if there are other boats in that area, that they're not riding over those boats and they're not hurting the fishermen. That's why these guys are sitting on the boats with the infrared and watching are there other ships he's going to hurt? Maybe the guy doesn't have an AIS and all that type of stuff and then they should be able to twist that line. So, it's not about the loudness of the noise, it's not about that type of stuff. The 500-meter zone is usually the industry's standard at a bare minimum to watch if the sound is so loud, how far it's going to pull and usually on that section above, the sound starts to decrease to a point the animals can handle it, it still says it's not loud. So, I just want to make that clear. Those sounds one can hear far away, but to hear a sound far away and to scare off the thing in flat-floor Afrikaans, your ale, and then to leave, is two different things and there are certain... one calls them threshold shifts they look at. So, they look at what kind of anomaly the animal is going to have and what do the guys with the thick glasses and white coats say about how do those animals deviate from their land, from where they eat, from what they do so we try to look at those different disorders, yes, so we understand that it's the fisheries and fishermen are really dependent on those areas, we know that these are a little bit deeper grounds, so, it's behind that fishing industry's ring fence area, but we understand that there are still people who go out*

Item No	Item
	there and that they depend on that area and there are people who are dependent. So, we really don't want to come and step on it and come and say it's not important. It's really, it's important to us and we want to look at it. *The economic benefit. Yes, so we can't talk terribly about the economic benefits of this project itself at this point. This project itself will not have an economic benefit for South Africa at this stage, but if we only look at the identification and this potential future use of the goods there might be an economic benefit. So how that benefit is going to be distributed in South Africa and how it's going to be used in South Africa, that's still up in the air and we can't really say how it's going to happen either. What the guys are going to do with it and what the situation is going to be is hard to say at this point. It's going to depend on a bunch of stuff, from what source there is, is it gas, is it oil, is there nothing, is there anything else they get maybe? You know that type of stuff. So, one can't say anything about the economic benefit at this point, but the important thing to consider if one wants to look at that type of stuff and if one just looks at resource identification and one forgets now for a small portion of the other stuff is that one doesn't do this stuff now you're not going to be able to identify the resource later, and see if you can use it as part of our transition or as part of our energy mix or our part of that type of stuff. So, this is, if we're talking about the water that has to run under the bridge, this is part of the water that has to run under the bridge before they can identify that resource. So, I'm just trying to explain the process. We don't approve of it, but we say it's part of the economic good they have to do ahead of time. So, obviously it doesn't happen in isolation, it happens inside environment and it happens inside the fishing industry and that's why one has to go through the EAI process to see what that impact is and if there are going to be sufficient benefits to be able to approve it then.* *And then yes, we agree, we're aware that this is your culture, that it's important to you, that it's your way of life and we're aware of the free and prior informed consent. We work according to it as much as possible. We know that the legislation in the country does not always match up as it perhaps should. We take that into account, but despite that, we're still trying to get to you, we're trying to get to the communities to come and hear what they have to say and we want to include it as a key part of our process. It is very important for us to make this a part. So, although there is still a lot of good to be done to include it in South Africa in a much better way and well, at this stage the legal process is this NEMA public participation process where there are public participation processes in all legislation. So, we admit it. We know that there are other guys, for example, who look at this, at broader pictures, for example, I don't know if you've seen of Mr. Pedro Garcia and stuff, but he also has his ideas. So, I think there's a lot that one can go and learn from him and I think there's a lot of good ideas that come out of that stuff. I think that should be looked at as well. So, we also went to talk to him and heard what he had to say and think we as an industry can learn a lot from that and learn from you guys about talking about that stuff.*
d.	**Enrico Adams** My agtergrond is, ek ook maar marine mamal-ondervinding onder my. Ek is 'n kommersiële duiker. Ons doen kommersiële werk. So, ek is ook 'n bootelenaar, maar 'n ander tipe bootelenaar. Ek vang nie vis nie. Ek het gewerk met vis, enige vis, anchovy, Rudi weet. Ons het samplings gedoen enige ding. Ons het data ge-collect en ek praat daar vir myself so ek voel dat 'n transition en klein vissers saam kan bestaan. Dis net uit my oogpunt uit. En dat ons moet besluit op die ou einde van die dag, wil ons energy sufficient wees, of wil ons dependent wees. En ons moet frank wees daarop op die einde van die dag en clear kom met waar jy staan met energy sufficiency en of jy daarteen is. Die volgende is net 'n vraag aan EIMS is hoe word 'n mens deel van die Environmental Impact van die staanspoor af? Is dit 'n sekere, kyk julle gaan nou vir (wat is die ding se naam?) Searcher ook verteenwoordig en julle hoor daar die vrae wat gevra word, obviously. Is daar nie werkswinkels of deelname in julle proses hoe julle die gemeenskappe kan betrek wat meer wil weet oor hoe dit gedoen word nie, want ek voel altyd as ek nie 'n ding verstaan nie

Item No	Item
	dan gaan ek altyd negatief daaroor wees. Ek moet dit verstaan en ek moet dit uit die staanspoor uit verstaan en as ek bedoel uit die staanspoor uit jy kan vir my sê daardie ding is 20 meter lank nie. Ek het hom nie gesien nie, so ek gaan nie jou woord vat hy is 20 meter lank nie. Ek wil hom sien, nou gaan ek sien oukei wat maak hy en ek sê nie jy moet almal of van ons almal hier op die boot vat, ons gaan nou 'n jolly ride vat ons gaan nou hoor wat gaan die ding maak nie, een of twee mense. Word of mouth is 'n baie powerful ding en as een of twee mense kan op so ding gaan en hy kom terug na daardie ondervinding en hy verduidelik vir ons in meer detail wat gedoen was dan dink ek sal ons sal my denkwyse ... Ek vat dit vir my ook. Soos ek sê ek praat vir my, sal my denkwyse oopgaan op die einde van die dag. Dis hoe ek voel oor die hele storie. *My background is, I too but marine mamal experience under me. I'm a commercial diver. We do commercial work. So, I'm also a boat owner, but a different type of boat owner. I don't catch fish. I've worked with fish, any fish, anchovy, Rudi knows. We've done any thing. We've collected data and I'm speaking for myself there so I feel like a transition and little fishermen can coexist. It's just from my point of view. And that we have to decide at the end of the day, do we want to be energy sufficient, or do we want to be dependent. And we've got to be frank on that at the end of the day and come to terms with where you stand with energy sufficiency and whether you're against it. The following is just a question to EIMS is how does one become part of the Environmental Impact from the outset? Is that a certain, look you guys are going now for (what's the thing's name?) Searcher also represents and you guys already hear the questions asked, obviously. Aren't there workshops or participation in your process how you can engage the communities that want to know more about how it's done, because I always feel like if I don't understand a thing then I'm always going to be negative about it. I have to understand that and I have to understand it from the outset and if I mean from the outset you can tell me that thing is 20 metres long. I haven't seen him, so I'm not going to take your word he's 20 yards tall. I want to see him, now I'm going to see okay what does he do and I'm not saying you should take everyone or some of us all here on the boat, we're going to take a jolly ride now we're going to hear now what's going to make the thing, one or two people. Word of mouth is a very powerful thing and if one or two people can go on such a thing and he comes back to that experience and he explains to us in more detail what was done then I think we'll have my way of thinking... I take it for me too. As I say I speak for me, my way of thinking will open up at the end of the day. That's how I feel about the whole story.* **GP Kriel** Baie dankie vir dit. Ons sal ook jou kommentaar opneem en dit sê. Hoe 'n mens deel raak van die proses is deur op hierdie stadium deel te neem aan prosesse soos hierdie. Soos ek gesê het ons wil graag terugkom en kom meer vertikswinkel oor wat ons gekry het en goed maar ek verstaan dat daar ... Jy weet dit is hierdie vae begrip van 'n mens weet nie eintlik wat aangaan nie totdat jy dit gesien het nie so dit is 'n goeie punt. Ek dink dit is dalk iets om in ag te neem dat 'n mens dalk 'n kyk of daar kan geleenthede wees om dit te doen sou hulle goedkeuring kry dat daar miskien verteenwoordigers van die gemeenskap betrokke is by hierdie tipe goed dat hulle dalk ek weet nie geleenthede kry om op die boot te gaan as dit goedgekeur word. Ons is besig om na daardie tipe goed te kyk jy weet en dat daar half 'n oversight rol of iets soos dit kan wees op die bote. Miskien is so iets is dalk dit. 'n Ander ding waarna 'n mens ook moet kyk is watse geleenthede is daar vir opleiding, vir onderrig in hierdie tipe goed. Jy weet hulle is dalk net vir drie of vier maande hiërso of wat ookal wat hulle deel is met hulle goed of vir 70 dae maar dat hulle op 'n langer termyn jy weet 'n impak het in terme van die onderrig en in terme van jy weet, 'n bydrae tot die gemeenskap en daardie tipe goed. Jy weet as hulle kom deelneem in die gemeenskap moet hulle tog kom deelneem in die gemeenskap. As hulle die vissersgronde kom impak hê dan moet hulle tog kom deelneem en op 'n groter manier ook. So, ons is besig om te kyk na daardie tipe goed. Ons sal kyk hoe 'n mens dit dalk kan integreer as dit moontlik is.

Item No	Item
	Thank you so much for that. We will also record your comments and say so. How one becomes part of the process is by participating in processes like this at this point. Like I said we'd like to come back and get more workshop on what we got and stuff but I understand that there... You know it's this vague understanding of one doesn't actually know what's going on until you've seen it so that's a good point. I think it might be something to consider that one might have a look at if there might be opportunities to do that should they get approval that maybe there are representatives of the community involved in this type of stuff that they might I know don't get opportunities to go on the boat if it's approved. We're looking at that type of stuff you know and that there could be half an oversight roll or something like that on the boats. Maybe something like that might be it. Another thing that one should also look at is what opportunities there are for training, for teaching in this type of stuff. You know they might only be here for three or four months or whatever oh whatever they share with their stuff or for 70 days but that in a longer term you know they have an impact in terms of the teaching and in terms of, you know, a contribution to the community and that type of stuff. You know if they come to participate in the community they have to come and participate in the community. If they come to impact the fishing grounds then they have to come and participate and in a bigger way as well. So, we're looking at that type of stuff. We'll look at how one might be able to integrate it if it's possible.
a.	**David Harper** *I have some concerns with the EIMS doing a survey for multiple companies. Which are in effect where I see it competing. So, the question is, what are the risks of competing companies trying to influence the EIA's of their rivals and secondly will EIMS sell the data to interested parties or is EIMS doing the survey for someone specific?* **GP Kriel** *Like I said, we are doing it separately. We created two separate teams in this and I think you know some of the specialists will also know, I was involved in presenting some of the Searcher stuff but I am not involved in running the day-to-day stuff for the Searcher stuff, I am running the TGS project and carrying on with that on its own. We are still ... we are assessing both of it on its merits and we are fortunately in the position where everything that we do is going to get scrutinised by the public in anyway. So, if there are gaps, if there are holes if we are doing stuff in an incorrect way, you as the public will have full access to all of that stuff to be able to see whether we are doing anything illegally. And so our real purpose in this is not to do it in that way but the opportunity is there for us to have a common understanding of the area and to then to be able to implement that and make sure it is described accurately. So, we really do not want to hide anything, we were not colluding with anyone, we are not doing the survey ourselves at all. We are doing the assessments to determine if the survey itself should go ahead. So, we are not selling any data to anyone. We are just involved in assessing the impact of it and determining whether an environmental authorisation is something that should be pursued or not. So, from that point of view we are completely independent and we are open the public scrutiny in everything we do on this. So, should there be something that we are not doing correctly then that is open to you guys to point that out to us. And again like I said whatever we decide and whatever we promote at the end of the process, well promote is not the right word, but whatever our opinion is at the end of the process that will then go to the decision-makers. They will then have to scrutinize that and see whether that is correct or not and when they make their decision it is a whole process. So, although it goes to the DMR there is a whole lot of other stakeholders and key role players within those departments and other departments that come together to make that decision. And then even after that, I mean as you all know should the decision be positive for the guys or even negative and people want to appeal against that then that is that, they can appeal against that. So, it is an open process it is not something that has been done you know cloak and dagger. We really do not want to do any of that. So ja, that is the process. And fortunately we live in a*

	country where even if you do not agree with what the minister says after the appeal period that you can then go and challenge that in court if you want to. So, we still live in a fairly free and open society where that avenue is still also available to you. So, we are not trying to hide anything we are just trying to do the assessment to the best of our abilities.
f.	**Pia Plougman** *I do not know how successful the previous surveys have been but has it been majorly successful and what are they hoping to find in this new zones that they will not find further towards the coast and how much is that? What is the cost? Because you can already hear that there have been impact from those surveys closer to the coast. I do not know if I am making sense in my question?* *If they have not found substantial amount of gas or oil closer how much more are they hoping to find further out at sea? And is it worth the damages already done?* **GP Kriel** *There have been a lot of surveys that have been done in the past and that started over decades ago. So, I think they started in the late seventies I mean the guys can probably correct me here, but it is in the late 70's, 80's, 90's. It was a fairly aggressive push to do all of that stuff so it was done quite a bit and then it continued through the 2000's as well. Back then it was bit more cowboy than it is right now so the standards have increased significantly. There is a lot more scrutiny on it. So, even the technology that they are using is significantly advanced from what it was in the past. So, it is not just a little let us throw a bomb at the back of the boat and let it explode and record that. It is a bit more calculated and bit better technology. In terms of the impact you know unfortunately along the coast there have been seismic surveys that have been done and they have found a significant amount of oil and gas and that is largely as a result of the Orange Basin and how it tops the oil. So, there is a significant amount of resource there. The problem is that we need to be able to quantify that I think as a country. So I think that is the reason why the guys are interested in that. Obviously, there are financial benefits. Obviously, there is a whole lot of other reasons to want to come into something like that, but I think that is probably the reason why they want to do it. So, like I said in that particular area, there are not so many of those survey lines. So, again, it is probably to just establish what is there, and if there is something to pursue further. Like I tried to explain earlier, is this is the first step in the process of this. So, first you do your reconnaissance, then you do further exploration which typically involves sticking a borehole, or drill into the ground and drilling a few kilometres down in to see what there is and how much there is and then you have to seal that up, plug it, abandon it properly and make sure that you do not mess that up, and then you come back if there is something viable, and you know that you have got sufficient quantities, depending on the price of the oil, social, economic conditions and the geopolitical conditions around the earth to then go and exploit that.* *Unfortunately, the Wes Coast is an area that has been impacted by a lot of things. Not just seismic surveys. So, if you go up and down the coast, I am sure we are all well aware of that, there is a lot of mining going on, there is a lot of fishing going on, industrial fishing itself, which also has a massive impact on stock levels and on just the habitat at the bottom of the ocean and in the ocean. And then there is a whole lot of other things. So, it is part of big shipping lands across the world and things like that. So, there is a whole host of other impacts associated with that happens on that national environment. So the 3D seismics, for sure have an impact. We need to go and quantify that and see if the impact is big enough or not and then we need to also take cognisance of the fact it happens in an already disturbed environment to a large degree as well. It is not to say that because that because it is already trashed, or disturbed, that you cannot go, or just can just go and you can just go and do what you want. You need to, exactly because of that, we need to go and make sure that we protect it in the right way. And that is why these types of*

'n Openbare vergadering is geskeduleer tydens die vooraansoekfase met die Belanghebbende en Geaffekteerde Partye (I&APs). Die doel van die vergadering was om die aanvanklike bekommernisse van die lede van die publiek en belangrike I&APs vas te lê. Tydens die openbare vergadering wat tussen 16:00 en 18:00 plaasgevind het, is 'n aanbieding van die projekbeskrywing, voorlopige impakassessering, projekspan en projekttydraamwerke aan alle deelnemers van die vergadering deur Environmental Impact Management Services (EIMS) Pty (Ltd) gelewer. 'n Aanbieding is deur mnr GP Kriel van EIMS in Afrikaans gelewer. SEICHE het 'n aanbieding gelewer oor die omgewingsversagting wat tydens seismiese opnames in terme van die Marine Soogdier Waarnemer (MMO) en Vissakkelbeampte (FLO) in Afrikaans uitgevoer is. Die aanbieding is deur Mnr Rudian Baily gelewer. Nadat die aanbiedings afgelewer is, is 'n vraag- en antwoord sessie geopen waar deelnemers vrae gevra het of hul kommentaar oor die projek uitgespreek het. Die bywoningsregister is aangeheg as 'n aanhangsel tot hierdie dokument.

A Public Meeting was scheduled during the pre-application phase with the Interested and Affected Parties (I&APs). The aim of the meeting was to capture the initial concerns from the members of the public and key I&APs. During the public meeting which took place between 16h00 and 18h00, a presentation of the project description, preliminary impact assessment, project team and project timeframes was delivered to all attendees of the meeting by Environmental Impact Management Services (EIMS) Pty (Ltd). A presentation was delivered by Mr GP Kriel from EIMS in Afrikaans. SEICHE delivered a presentation on the environmental mitigation carried out during seismic surveys in terms of the Marine Mammal Observer (MMO) and Fishing Liaison Officer (FLO) in Afrikaans. The presentation was delivered by Mr Rudian Baily. After the presentations were delivered, a question and answer session was opened where attendees asked questions or expressed their comments regarding the project. The attendance register has been attached as an appendix to this document.

NOTULE/ *MINUTES*

Item No	Item
1.	Alle deelnemers is versoek om die bywoningsregister te onderteken soos hulle ingeskryf het. Aanbiedings van EIMS en SEICHE van die projekbeskrywing, aansoekproses en omgewingsversagtings tydens seismiese opname is gelewer volgens die agenda hierbo aan die vergaderinggangers. Daar is aangedui dat die vergadering opgeneem sou word vir die doeleindes van akkurate notule neem. Agtergrondinligtingsdokumente (in Engels, Afrikaans en isiXhosa), kommentaarvorms, registrasie, inligtingsuitdeelstukke en bywoningsregisters is by die vergadering beskikbaar gestel. Die deelnemers is aangemoedig om hul kommentaar en bekommernisse in te dien deur die kommentaarvorms in te vul wat verskaf word of deur kommentaar in te dien by die projek-e-posadres wat verskaf is. Daar is opgemerk dat alle deelnemers wat hul kontakbesonderhede verskaf het, by verstek geregistreer sal word op die I&AP-databasis wat deur EIMS gehandhaaf word. As aanleiding van die aanbiedings is die vloer oopgemaak vir 'n bespreking en die deelnemers is aangemoedig om enige vrae of bekommernisse wat hulle oor die projek gehad het, op te stel. *All attendees were requested to sign the attendance register as they entered. Presentations from EIMS and SEICHE of the project description, application process and environmental mitigations during seismic survey were delivered as per the agenda above to the meeting attendees. It was indicated that the meeting would be recorded for the purposes of accurate minute taking. Background Information Documents (in English, Afrikaans and isiXhosa), comments forms, registration, information handouts and attendance registers, were made available at the meeting.* *The attendees were encouraged to submit their comments and concerns through filling in the comment forms provided or by submitting comments to the project email address provided. It was noted that all attendees who have provided their contact details would be registered by default on the I&AP database maintained by EIMS. Following the presentations, the floor was opened for a discussion and the attendees were encouraged to bring up any questions or concerns they had about the project.*
2.	**Vrae en Antwoord/ *Questions and Answers***
a.	**George Lenee** Goeie dag. Ek is George Lenee. Ek is 'n visserman. Ek sien nou hierdie koördinate, wat julle hier aanbied, hier op die blaai, is dit in-shore of op land of wat is dit? Want ek hoor julle gaan nou 120 kilos buite Saldanha wees né? Ons het 'n visbank, omtrent ses-en-vyftig of sewe-en-vyftig myl van Saldanha af. Waar jy van November af, né, vir drie maande tuna vang. As dit nie nog langer is nie. So, dit is op in die Wes, by Saldanha op. Hier by jou, sien julle gaan hulle 'n honderd-en-twintig hier af, kilo's uit, daarvan Saldanha, Hondeklipbaai toe. Hier lê buitekant Doringbaai, lê 'n vyftig myl bank wat ons ook elke jaar, ook seker so vir twee maande, tuna vang. So, en dan kyk die koördinate hierso die nommers. Dit is waar ons gewoonlik daardie ding van die stryd in die drie-en-dertig; dit is 'n Snoekmerk. Daardie is al. Dit is alles visvangmerke wat ons elke jaar ... En julle sê julle gaan iets ... Ons kan nie 'n Snoeksaksoen bepaal nie. Dit is alles te doen met klimaat "change". Vanjaar, ons moet nou al vlugtyding het, maar ons vang nie vis nie. So, hoe gaan julle die oes se Snoek bepaal? Wanneer is dit die Snoektyd? *Good day. I'm George Lenee. I'm a fisherman. I see now these coordinates, what you guys are presenting here, here on the page, is it in-shore or on land or what is it? Because I hear you're going to be 120 kilos outside Saldanha now, right? We have a fish bank, about fifty-six or fifty-seven miles from Saldanha. Where you catch tuna from November, say, for three months, if not even longer. So, it's up in the West,*

Item No	Item
	up at Saldanha. Here with you, you see them going down a hundred and twenty here, kilos out, from Saldanha, to Hondeklip Bay. Here lies outside Thorn Bay, lies a fifty-mile bank which we also catch tuna every year, also probably for two months. *So, and then the coalinoites check the numbers. That's where we usually do that thing about the fight in the thirty-three; it's a Snoek Mark. That's all. These are all fishing marks that we have every year... And you say you're going to do something... We can't determine a Snoek season. This is all to do with climate "change". This year, we should have fished by now, but we're not catching fish. So how are you going to determine the harvest's Snoek? When is it the Snoek Time?* **GP Kriel** So, ons het 'n redelike goeie idee van die navorsing en van die opnames en goed wat gedoen word. Deur word elke jaar, deur die Departement van Visserye, en Bosbou, en daardie ouens. So, hulle kyk na al die inligting wat vir die vissermanne afkom, en van die vissarbote afkom, en al daardie tipe goed. So, ons het 'n redelike idee van waar die ouens visvang, en waar die vissersgronde is. Ek sê nie daardie data is altyd perfek nie. So, ons gaan vir julle wys wat ons gekry het, en dan gaan ons terugkom en dan kan julle ook vir ons sê, "Okay, maar luister, daar het ons dit gevang. Daar het ons dit gevang op daardie tyd van die jaar. So, ons is nog steeds oop vir julle om ook vir ons te kom sê, okay. Wat ek wel wil sê is daardie hele aansoek area daarso, is van die ... En die industriële ouens doen. Ek praat nie nou van julle goed nie. Ek praat van die groot industriële boue en daardie ouers, wat hulle noem die Fisheries Ring Fence. So, dit is agter daardie hele storie. Dit is van die kontinentale bank, basies, af wat hy dieper ingaan. So, dit is daar waar die water, jy weet, 'n duisend meter diep is, en dieper raak. So, dit is min or meer die diepte daar, maar versekar es daar goed is wat in ons verslag nie staan nie, of ons vissery persoon se verslag nie is nie, en dan ... Ons gaan nou vir julle kom wys. So dan kan julle vir ons sê, "Okay, maar daar stem ons nie saam daarmee nie. Daardie is wat ons weet. Hierso, ons vang daar vis. Wat ons gaan doen is, ons het gaan kyk na die verskillende "spawning" areas. Ons gaan kyk na waar die verskillende ... Waar die groot hoeveelheid eiers lê. Waar al daardie tipe goed is. So, ons gaan kyk na al daardie verskillende goed en dan kyk ons waar die ... Want hulle noem dit die "recruitment" areas. Al daardie goed is in hoe die visse beweeg in en uit dit uit. Ons probeer al daardie goed na kyk en dan te probeer vasstel wat die rigting is waarheen hulle gaan beweeg. Wat die seisoen is vir al daardie goed. Soos ek gesê het, ons is ook afhanklik van julle, van julle kennis hierso. So, as daar iets is wat ons nie daarin ingesluit het, of iets is wat julle nie mee saamstem nie; moet julle dit asseblief vir ons sê. Ons kan nie net op daardie bronne kyk nie. Julle is die ouens wat op die waters is. So, soos ek gesê het; hierdie is die inisiële gedeeltes. Ons gaan weer ons moet uitkyk vir daardie goed. As ons terugkom dan gaan ons met julle kom gesels en dan kan ons hoor wat sê julle. *So, we have a pretty good idea of the research and of the surveys and stuff that's being done. There's every year, through the Department of Fisheries, and Forestry, and those guys. So, they're looking at all the information that's coming down for the fishermen, and coming down from the fishing boats, and all that type of stuff. So, we have a fair idea of where the guys are fishing, and where the fishing grounds are. I'm not saying that data is always perfect. So, we're going to show you what we got, and then we're going to come back and then you can also tell us, "Okay, but listen, there we caught it. There we caught it at that time of year. So, we're still open for you guys to come and tell us too, okay. What I do want to say is that whole application area, is from the... And the industrial guys do. I'm not talking about your stuff right now. I'm talking about the big industrial boats and those guys, what they call the Fisheries Ring Fence. So, it's behind that whole story. It's from the continental bank, basically, that he goes in deeper. So, it's there where the water, you know, is a thousand meters deep, and gets deeper. So, that's more or less the depth there, but certainly if there's stuff that's not stated in our report, or our fisheries*

	person's report isn't, and then... We're going to come and show you now. So then you can tell us, "Okay, but there we don't agree with that. That's what we know. We catch fish there. *What we're going to do is, we want to look at the different "spawning" areas. We're going to take a look at where the different... Where to lay the large amount of eggs. Where all that type of stuff is. So, we're going to look at all that different stuff and then we'll see where the... Because they call it the "recruitment" areas. All that stuff is in how the fish move in and out of it. We try to look at all that stuff and then try to figure out the direction where they're going to move. What the season is for all that stuff. As I said, we are also dependent on you, on your knowledge. So, if there's something we haven't included in it, or something you guys don't agree with; please tell us that. We can't just look at those sources. You're the guys who are on the waters. So, like I said; these are the initial passages. We're going to know we have to look out for that stuff. When we come back then we're going to come and talk to you and then we can hear what you're saying.*
b.	**Rooey Shoshois** Ek lewe uit die see uit. Ek is 'n visser. Ek wil weer sê wat ek in alle vorige vergaderings gesê het, dat die eksperimente gaan nie werk vir ons nie. Dit gaan ons lewensbestaan afsny. Ek gaan nie weer verduidelik wat ek in alle vorige vergaderings verduidelik het nie, maar ek het twee vrae. Die eerste een is, "Voorlegging wat julle nou hier gedoen het; het julle alreeds hier in Lambertsbaai gekom doen?" Dieselfde voorlegging. Al verskil wat ek nou hier sien is, julle begin nou nader aan die kus beweeg. Wat ek wil sê rondom die twee honderd ses-en-vyftig kilometer gaan julle nou in die see "explore". Ceres is 'n dorp wat meer as vyf honderd weg is van Lambertsbaai af. En as Ceres se berge sneeu kry, dan voel ons die impak hier. Ek hoef nie verder vir julle te verduidelik wat ek vir julle eintlik wil sê nie. Al gaan julle op die drie honderd kilometer; gaan ons as kleinskaalse vissers, alle vissers, gaan die impak voel. Nou wil ek weet wat is die rede dat julle nou vandag weer dieselfde voorlegging kom doen, nadat julle in 'n vorige vergadering gehoor het wat is ons se gevoel. Die tweede een is, as ek kyk na die saal, wie is almal vandag hier in die saal, in vergelyking met wie was in die vorige vergadering in die saal. In die vorige vergadering het ons gehad, die heel eerste vergadering het ons gehad, die vissers, die boere kommersieel en kleinboere. Ons het toerisme hier gehad. Ons het die Environmental Departement hier gehad. Almal kon hulle sê gesê het. Alle sektors van die gemeenskap en die areas waar dit geraak is. Die tweede vergadering, toe sien ek 'n paar vissers wat baie sterk deurgekom het en gesê het, "Nee," vir Searcher. Vandag is dieselfde voorlegging, maar wat ek sien is; een visserman, twee vissermanne, drie vissermanne, en dan sien ek die jeug. Ek sien die jeug. My ore is op die grond en ek ... Kommunikeer respek vir my; laat ek klaar praat, asseblief. En ek het winde hoor waai die afgelope tyd wat betref die jeug van Lambertsbaai. Al die jong mense wat hier sit het vandag een doel hoekom hulle hier is. Ek wil graag hê u ... Ek soek nie geen lid van die gemeenskap moet opstaan en die vraag antwoord nie. U wat die voorlegging vandag hier kom doen moet vir hierdie jeug sê wat hier dit, as die goed gaan gebeur; gaan daar werk wees vir hulle, want julle gaan op die twee honderd ses-en-vyftig kilometer; gaan julle "explorations" doen. Is daar werk vir die jeug van die gemeenskap? Dit is al vir nou. Sal weer later terugkom. *I live out of the sea. I'm a fisherman. I want to say again what I have said in all previous meetings, that the experiments are not going to work for us. It's going to cut off our livelihoods. I'm not going to explain again what I've explained in all previous meetings, but I have two questions. The first one is, "What you've done here now; have you come here in Lamberts Bay already?" Same submission. All I see here now is, you're starting to move closer to the coast now. What I want to say around the two hundred and fifty-six kilometers you are now going to "explore" in the sea. Ceres is a town more than five hundred away from Lamberts Bay. And if Ceres' mountains get snow, then we feel the impact here. I don't need to explain to you further what I actually want to tell you. Even if you go on the three hundred miles; Are we*

as small-scale fishermen, all fishermen, going to feel the impact. Now I want to know what is the reason that you are coming to make the same presentation again today, having heard in a previous meeting what we feel. The second one is, when I look at the hall, who are all here in the hall today, compared to who was in the previous meeting in the hall. In the previous meeting we had, the very first meeting we had, the fishermen, the farmers commercial and the peasants. We had tourism here. We had the Environmental Department here. Everyone could have said their say. All sectors of the community and the areas where it was affected. The second meeting, then I saw some fishermen who come through very strongly and said, "No," to Searcher. Today is the same submission, but what I see is; one fisherman, two fishermen, three fishermen, and then I see youth. I see youth. My ears are on the ground and I... Communicate respect for me; let me finish talking, please. And I've heard winds blowing lately in terms of the youth of Lamberts Bay. All the young people sitting here today have one purpose as to why they are here. I'd like you... I'm not looking for no member of the community to stand up and answer the question. You who come to do the presentation here today must tell these youth what sits here, if the stuff is going to happen; are there going to be work for them, for you go on the two hundred and fifty-six miles; are you going to do "explorations". Are there jobs for the youth of the community? That's all for now. Will come back later.

GP Kriel

Baie dankie vir dit, tannie Rosie. Ek waardeer dit. Ja, ons is bewus van die feit dat dit lyk soos duplikasie van goed. Ons verstaan dit. So, die rede hoekom dit dieselfde lyk is, is omdat dit dieselfde tipe aansoek is. Die proses, die wetlike vereistes, al daardie goed is dieselfde, en ons moet ongelukkig deur dieselfde proses gaan. So, ek is jammer as daar dalk 'n bietjie verwarring is met dit, maar dit is omdat dit 'n ander maatskappy wat ook aansoek doen, en hulle wil deur dieselfde proses gaan. Hulle wil ook dieselfde tipe goed kan doen. So, daar is ongelukkig 'n bietjie van 'n duplikasie in daardie stroom, maar dit is ongelukkig die wat wat dit vereis, en ons moet deur daardie proses gaan met dit. So, as julle wil kommentaar lewer; julle sal sien die aansoek areas is verskillend, en dit is omdat elke maatskappy; hulle werk nie saam nie. Die een sê, "Okay, ons dink daardie goed gaan ons wil hê." Die ander maatskappy sê, "Okay, ons wil dit dalk 'n bietjie op 'n ander manier doen. Ons wil kyk na 'n breër area, of 'n wyer area, of 'n kleiner area." So, dit is hoe hulle werk met daardie tipe goed. Ons beinvloed hulle nie of dit nie. Hulle sê vir ons dit is wat hulle wil doen, en dan moet ons gaan kyk of dit wat hulle wil doen okay is of nie. Of dit reg is vir die omgewing of nie, en vir die mense, en al die goed, wat dit wil kom doen. So, dit is basies hoekom daar twee verskillende prosesse is, en hoekom die baie dieselfde lyk. Maar dit beteken nogsteeds nie dat daardie prosesse nie belangrik is nie. Dit beteken nogsteeds nie dat 'n mens nie moet deelneem in daardie proses nie. So, dit is belangrik om julle sê te sê. As jy ongelukkig is daaroor. Dit is belangrik om te sê of julle vir of teen dit is, of wat ookal. Julle is geregtig om dit te sê, en julle is geregtig om dit te doen. So, ons wil nie dit kom wegsteek nie. Dan, ek verstaan daar is vissermanne wat nie hier is. Daar is dalk nie ander mense nie, maar ons het nog meer mense uitgenooi na hierdie vergadering toe as die vorige vergadering. Ons het regtig moeite gedoen om al die mense wat verlede keer hier was, het ons ook op ons lys gesit sommer net van die begin af. En as jy verlede keer by die vergadering was, het ons jou ook 'n e-pos gestuur of 'n SMS gestuur, of 'n passtuk gestuur, of wat ookal die goed daarop was, het ons uitgestuur. So, ongelukkig is daardie tipe goed . . Ons kan mense nie forseer om hier te wees nie.

Ons wil graag hê dat die mense hier moet wees om soveel as moontlik van die mense se kommentaar te hoor en daardie goed, maar, soos ek gesê het, hierdie is nie die eerste en enigste one nie. Daar is weer 'n geleentheid om en ons gaan weer terugkom, en die sal vir my "great" wees as ons dan nou 'n groot groep mense het wat ons dan hier die ding kan vasvat en hom deurwerk. So, baie dankie vir dit. Dan, in terme van die jong mense en die werkskepping en daardie tipe goed. Ja. So, ek weet nie wat se winde gewaai het, en wat se goed gesê is nie. Ek was nie deel van daardie goed gewees nie. So, ons hardloop hierdie proses, en ons gaan deur die wetlike vereistes. Ons probeer mense in kennis te stel om te sê,

Item No	Item
	"Kom, asseblief." In terme van die werkskepping vir hierdie fase van die projek: onthou hierdie proses is 'n langtermyn proses. So, die "reconnaissance", die verkenning, is 'n langtermyn ding. Dit is nie 'n ding wat nou gaan gebeur nie. En daardie langtermyn proses sluitend is nou verkenning vir die eerste jaar na hulle aansoek gedoen het. As hulle goedkeuring kry, dan daarna gaan hulle na eksplorasie toe, en daardie eksplorasie beteken, "Kom ons drill en kyk wat daar is." As hulle klaar is met die eksplorasie en hulle het iets gekry, en die bron is groot en sterk, en hulle kan baie geld maak daaruit, of hulle kan dit uittrek of wat ookal. Dan gaan hulle kyk die olie prys is sowaar. Hulle kan dit verkoop teen 'n wins. Daar is 'n bron vir Suid-Afrika om dit te gebruik. Al daardie goed. En dan daarna kan hulle dan eers gaan, en dan kan hulle aansoek doen om te produseer. En die produseer is wanneer jy dan die goed uittrek, en dan begin die goed gaan na die raffinadery toe waar hulle die petrol maak. Waar hulle die diesel maak. Al daardie goed. Dit is die lang proses, maar op elke stap moet ons eers 'n impakstudie doen om te kom kyk of dit wat gaan gebeur, of dit wat voorgestel is, of dit nie gaan skade maak vir die omgewing nie. So, dit is dan basies waar ons inkom. So, julle sal sien of dit nou ons is, of dit nou ander ouens is wat terug kom: dit hang af, jy weet, wie aangestel is om die "job" te doen. *Thank you so much for that, Aunt Rosie. I appreciate it. Yes, we are aware of the fact that it looks like duplication of stuff. We get it. So, the reason why it looks the same is because it's the same type of application. The process, the legal requirements, all that stuff is the same, and unfortunately we have to go through the same process. So, I'm sorry if there might be a little bit of confusion with it, but that's because it's a different company that's also applying, and they want to go through the same process. They also want to be able to do the same type of stuff. So, unfortunately, there's a bit of a duplication in that stream, but unfortunately it's the law that requires it, and we have to go through that process with it. So, if you guys want to comment; You'll see the application areas are different, and that's because every company; they don't work together. One says, "Okay, we think that stuff we're going to want." The other company says, "Okay, we might want to do it a little bit in a different way. We want to look at a broader area, or a wider area, or a smaller area." So, that's how they work with that type of stuff. We don't influence them or that. They tell us this is what they want to do, and then we have to go see if what they want to do is okay or not. Whether it's right for the environment or not, and for the people, and all the stuff, who want to come and do it. So, that's basically why there are two different processes, and why they look very similar. But that still doesn't mean those processes aren't important. This does not mean that one should not participate in that process. So, it's important to have your say. If you're unhappy about it. It's important to say whether you're for or against it, or whatever. You are entitled to say so, and you are entitled to do so. So, we don't want to come and hide it. Then, I understand there are fishermen who are not here. There may not be other people, but we invited even more people to this meeting than the previous meeting. We really made an effort to put all the people who were here last time, we also put on our list just from the beginning. And if you were at the meeting last time, we also sent you an email, or texted, or sent you a mail-in message, or whatever the stuff on it was, we sent out. So, unfortunately, that type of stuff... We can't force people to be here. We'd like the people here to be here to hear as many of the people's comments as possible and that stuff, but, like I said, this isn't the first and only one. There's another opportunity to and we're going to come back again, and it'll be "great" for me if we have a big group of people now that we can then take hold of the thing here and work him through. So, thank you so much for that. Then, in terms of the young people and the job creation and that type of stuff. Yes. So, I don't know what winds blew, and what stuff was said. I wasn't part of that stuff. So, we run this process, and we go through the legal requirements. We're trying to inform people to say, "Come on, please." In terms of the job creation for this phase of the project; Remember this process is a long-term process. So, the "reconnaissance," the exploration, is a long-term thing. It's not a thing that's going to happen now. And that long-term process is now scouting for the first year after they applied. If they get approval, then after that they go to exploration, and that exploration means, 'Let's drill down and see what's there." When they finish the exploration and they

Item No	Item
	got something, and the source is big and strong, and they can make a lot of money from it, or they can pull it out or whatever. Then they're going to check the oil price is so much. They can sell it at a profit. There is a source for South Africa to use it. All that stuff. And then after that, they can only then go, and then they can apply to produce. And the produce is when you then pull the stuff out, and then the stuff starts going to the refinery where they make the gasoline. Where they make the diesel. All that stuff. That's the long process, but at every step, we have to do an impact study first to come and see if what's going to happen, or what's been proposed, or if it's not going to harm the environment. So, that's basically where we come in. So, you'll see if it's us now, whether it's other guys coming back; it depends, you know, who is appointed to do the "job."
c.	**Rosey Shoshola** Met alle respek, meneer die voorsitter, ek sal graag wil hê u moet net vir die mense in "plain" Afrikaans sê; gaan daar werk wees vir hulle, al dan nie? Dit is al wat ek vra. *With all due respect, Mr. Chairman, I would like you to say only to the people in "plain" Afrikaans; is there going to be work for them, or not? That's all I ask.* **DP Kriel** Okay, in terme van hierdie aansoek vir die "reconnaissance permit"; nie op hierdie stadium nie. So, ek wil nie vir julle sê dat ons het niemand uitgenooi om te kom vir werk of enigeiets soos dit nie. Dit was nie die ding gewees nie. Ek is jammer as dit die indruk is wat daar buite was, maar dit was nie ons wat daardie boodskap uitgesit het nie. *Okay, in terms of this application for the "reconnaissance permit"; not on this stage. So, I don't want to tell you that we haven't invited anyone to come for work or anything like that. That wasn't the thing. I'm sorry if that's the impression that was out there, but it wasn't us who put that message out.*
d.	**Male Speaker 1** Ek het ook 2012 tot 2015, 2016 in die hawe gewerk. Ek het die eerste studie, of die persone wat eerste aansoek gedoen het; toe het ons 'n massiewe groot vergadering gehad met die verskillende identiteite wat daarmee betrokke is. Ek wil net aanvoeg of vir haar sê dat soos wat u dit nou uitwys. Die eerste paar stadiums is daar spesiale mense, in die sin dat jy professionele mense nodig om eers van die plak, totdat die bron daar is; as die olie bron daar is, so by so was dit gewees dat Lambertsbaai hawe sal ge-upgrade word. So, as dit is, as hulle sê daar is olie. Die geld is daar om ... Die prys en die goed is reg. Natuurlik, sal daar werk wees vir ons mense, maar die eerste paar fases het hulle spesialiste nodig om seker te maak. Want dit baat nie hulle gaan vir ons daarna toe te stuur. Ons sal nie weet nie. Maar wat ek wel weet, is die eerste ouens het hulle impakstudies gedoen. Die water, in die land; orals. En ek glo julle gaan dieselfde ook, maar weet dit is 'n fases. Dit is hoe hulle vir ons verduidelik het. Maar my vraag is ook, "Is daar werk vir ons mense?" Toe het hulle dit ... En ek weet nou ongelukkig het ek ... Weet ek nog van daardie tyd af dat daar vir die eerste paar fases, is dit mense wat gespesialiseer is in 'n sekere hoofyn, of in 'n sekere veld, om daardie werk eers te kan doen. Eers as die bron daar is, gaan dit definitief. Ek weet, want Lambertsbaai hawe gaan dan die ... Hoe kan ek nou maar sê? Die naaste hawe wees vir daardie ding. Ja, of nou die direk nou daar gaan wees; ek weet nou nie. Maar definitief. Dit gaan dan moet ... Maar obvious en dit sal ook vir ons mense moet 'n aanpassing wees om te gaan leer, so die dinge werklikheid gaan word. Dat ons mense ge"skill" kan wees. *I also worked in the part from 2012 to 2015, 2016. I have the first study, or the persons who applied first; Then we had a massively large meeting with the different identities involved with it. I just want to add or tell her that as you point it out now. The first few stages there are special ones, in the sense that you*

Item No	Item
	need professionals first from the place, until the source is there; if the oil source is there, so it was that Lamberts Bay harbour would be upgraded. So, if it is, if they say there is oil. The money is there to... The price and the stuff are right. Of course, there will be work for our people, but the first few stages they need specialists to make sure. Because it doesn't benefit them to send us to it. We won't know. But what I do know is the first guys did their impact studies. The water, to the land; everywhere. And I believe you guys are going the same way too, but know it's a phase. That's how they explained to us. But my question is also, "Are there jobs for our people?" Then they had it... And I know now unfortunately I have... Do I still know from that time that for the first few phases, it's people who are specialized in a certain mainline, or in a certain field, to be able to do that work first. Only when the source is there does it definitely go. I know, because Lamberts Bay Harbour is then going to be the... How can I just say? The nearest port is for that thing. Yes, whether or not it's going to be there right now; I don't know now. But definitely. It's going to have to then... But it's also going to have to be an incentive for us people to go and learn, so those things are going to become reality. That we humans can be "skinned." **GP Kriel** So in hierdie "reconnaissance permit" gaan dalk bitter min werk wees. Die werke wat nou uitgaan is eintlik vir die mense soos ons, vir ander wetenskaplikes wat op die boot werk, die "PAM Operators", die MMOs, al daardie ouens, verstaan. Maar die volgende werke; dan is daar dalk 'n geleentheid. Hoe daardie goed lyk op hierdie stadium; kan ons nie nou vir julle sê nie. En dit sal onverantwoordelik wees vir my om vir jou te sê, "Ja, daar gaan definitief, 100% verseker werk wees," want ons weet nie wat die bron is nie. Verstaan. En dit bepaal of daar dan volgende programme gaan wees. Wanneer dit kom by die produksie kant, wanneer hulle die olie uit die grond uittrek, dan kan hulle sê, "Okay, ons weet ons gaan soveel olie uittrek, en ons gaan dit vir so lank uittrek." En dan kan hulle sê, "Okay, "great," ons gaan dan soveel teruggee aan die gemeenskap. Ons gaan hierdie programme loods om die mense opgeleid te kry. Ons gaan al daardie tipe goed doen." Dit is dan wanneer jy, wat hulle noem 'n "Social and Labour plan" tipe ding moet doen. En dan moet jy in baie meer diepte gaan. Die "community profile". Jy moet gaan kyk watter behoeftes daar is. Al daardie tipe goed. En dan kom daardie impakte deur. En onthou dit is nie net daardie tipe goed wat gebeur nie. Daar is wat hulle noem die "secondary impacts" en daardie tipe goed. Dit is die goed wat so bietjie moeiliker is om te meet en met sekerheid te sê, maar byvoorbeeld as jy 'n olie rig het en daardie tipe goed; vir elke persoon wat op daardie olie rig is, is daar gewoonlik 'n ratio, daar is gewoonlik 'n verhouding. So, daardie een persoon het 'n ... Gaan instansie nodig hê om na sy mediese goed te kyk. Hy gaan nodig hê dat daar klinieke moet wees. Dat daar plekke moet wees om te bly as hulle van die boot afkom. Al daardie tipe goed. Dat daar restaurante is om te eet; plekke om te slaap. Dit is goed wat moeilik is om te meet en duidelike te sê. 'n Mens kan nie nou sê hoeveel dit gaan wees nie, maar daar is al daardie sekondêre impak. So, wanneer 'n mens produksie fase doen; dan kan 'n mens daardie goed meer akkuraat bepaal en dan begin, en dan kan kyk wat dit is. I think that's a very accurate description. So in this "reconnaissance permit" may be very little work. The jobs that are going out now are maybe for the people like us, for other scientists working on the boat, the "PAM Operators", the MMOs, all those guys, understand. But the following works; then there might be an opportunity. Now that stuff likes at this point; can't we tell you right now. And it would be irresponsible for me to tell you, "Yes, there's going to be definite, 100% assured work," because we don't know what the source is. Understand. And that determines whether there will be next programs then. When it comes to the production side, when they pull the oil out of the ground, then they can say, "Okay, we know we're going to pull out so much oil, and we're going to pull it out for so long." And then they can say, "Okay, great," we're going to give so much back to the community then. We're going to launch these programs to get the people trained. We're going to do all that type of stuff." That's when you have to do what they call a "Social and Labour plan" type of thing. And then you have to go into much more depth. The "community profile". You need to go and see what needs there are. All that type of

Item No	Item
	stuff. And then those impacts come through. And remember it's not just that type of stuff that happens. There's what they call the "secondary impacts" and that type of stuff. It's the stuff that's that little bit harder to measure and say for sure, but for example if you have an oil rig and that type of stuff; For every person who is directed at that oil, there is usually a ratio, there is usually a ratio. So, that one person has a... Going to need institution to look at his medical stuff. He's going to need there to be clinics. That there should be places to stay when they get off the boat. All that type of stuff. That there are restaurants to eat; places to sleep. These are things that are difficult to measure and say clearly. One cannot say now how much it will be, but there is already that secondary impact. So, when one does production phase; Then one can determine that stuff more accurately and then start, and then see what it is.
e.	**Chief Nicolaas Booysen** Ek is senior hoofman, Nicolaas Booysen. My vraag is eerste. U sê u en Searcher is beide op daardie blok in die aansoek proses. So, ek wil weet hoeveel jaar is u al besig om met die voorbereidings te doen om vandag hier met ons gemeenskap te kom die vooropgestelde idees te kom deel? En dan wil ek weet nadat .. Ek moet nou eers hier antwoord kry hoeveel jaar u al besig is, voordat ek nou verder kan gaan. *I am senior chief, Nicolaas Booysen. My question is first. You say you and Searcher are both on that block in the application process. So, I want to know how many years have you been doing the preparations to come here today with our community to come and share the preconceived notions? And then I want to know after... I just have to get an answer here now how many years you've been busy, before I go any further ka n now.* **GP Kriel** Ons is vroeër hierdie jaar aangestel deur Searcher, en toe later aangestel deur TGS. So, dit is nou 'n paar maande wat ons nou besig is met daardie twee projekte. Ja, ons het nie vooropgestelde idees nie. *We were hired earlier this year by Searcher, and then later hired by TGS. So, it's been a few months now that we're working on those two projects now. Yes, we don't have preconceived notions.* **Chief Nicolaas Booysen** So u werk direk vir Searcher? So, hulle betaal mos vir u? So, u werk vir hulle. Al het u u eie company, u word betaal deur hulle om die ding te kom doen. Met ander woorde, hulle is 'n maatskappy wat al jare bestaan. U doen al vir jare die goed. So, toe u en u maatskappy die gedagte gekry het van die idee van navorsing doen in die San se gebiedswaters en sy grondgebied; het u nie gedink dat u moet uitreik na die mense toe, en met die mense 'n gesprek aansit rakende dit waaraan u nou dink wat moontlik kan ontwikkeling wees of moontlike impakte het op die lewenswyse van die kusbewoners? Die vissersvolk. Nou vandag kom u met vooropgestelde idees sonder dat die San se free prior and informed consent daar betrokke is. U het nooit van die tydstip wat u en Searcher gekommunikeer het ... Searcher het al dieselfde goed gehoor. Hy stel nou net 'n ander agent aan. Hy het al klomp verskillende agente aangestel. Hy stel nou 'n ander agent aan. Hy het by velemale gehoor ... Hy het nooit die San gemeenskappe nie ... Hy nooi almal. Al die gemeenskappe behalwe die San gemeenskap, maar hy wil in die San se grondgebied en gebiedswaters, wil hy kom delf; inligting kom soek. Ons het nie julle se wetenskap in ons se argeologiese gebied nodig nie. As ons wil navorsing doen, doen ons dit op ons manier. Ons inheemse leefwyse sal vir ons bepaal hoe ons navorsing gedoen wil hê. U is nie 'n Suid-Afrikaanse maatskappy nie; u verteenwoordig nie 'n Suid-Afrikaanse maatskappy nie. Suid-Afrika het nie hierdie gas en olie nodig nie. Suid-Afrika is nie so 'n ontwikkelde land nie. Searcher het reeds vir ons gesê dat daar is nie 'n manier hoe hulle ons kinders kan vooraf laat opleì sodat hulle die kundiges op daardie bote kan bekom nie. Hulle

	het gesê hulle kan dit nie doen nie. U het dieselfde van hulle af. Jy kan dit nie doen nie, want daardie mense word saam met al ingevoer. Die bote, alles. Die bystandbote, alles kom in. In Australia. In New Zealand. In Kanada. In Amerika. Amerika het reeds al sy bedrywighede, sy seismic bedrywighede gestaak in 2016 al, nadat die omgewings-aktiviste en die Khoikhoi groepe, en die San groepe gekant gewees het teen sy operasies, maar hy is ten gunste van klimaatsveranderings prosedures. Nou Suid-Afrika is ook 'n land wat ten gunste is van koolstofvermindering in die land, maar hier kom u met u buitelandse geld om vir Mantashe deurmekaar te maak. Mantashe het nie minerale nie. Hy het geen natuurlike hulpbronne nie. Dit behoort aan die inheemse bevolking wat die San gemeenskappe is. So, alvorens u nog nie met die San gemeenskappe gekonsulteer het, meaningfully, sodat ons saam tot by hierdie gevolttrekking kan kom nie; sal en gaan u nie toestemming kry om navorsing te doen in ons gebiedswaters nie. Because daai rif wat julle van praat; hy strek daar uit die Suid uit tot in die Noordsee. Daardie rif is 'n broeiplek van ons se visbronne; van ons se voedsel waar vanaf die wêreld afhanklik is. Julle het klaar die Pacific Ocean vergiftig. So, waar gaan die wêreld nou nog in 'n ander plek as Suid-Afrika hierdie belangrike bron van voedsel kry? Nêrens anders as hier nie. So, u kan nie kom met u klankgeluide nie. Daardie goed maak 'n massiewe klankgeluid, because dit moet dwarsdeur die aarde gaan van daardie klipbanke en dit is verskeie tipe rotslae. So, as daardie klank; hy gaan al harder, al harder hier af wanneer kan daardie ding daardie dier stop? Hy maak daardie dier al hoe deurmekaar. So gaan jy ons se voedselbronne deviate. So veroorsaak dit laat ons se visbronne tot niet gaan. Nie net ons se visbronne nie; julle wys niks daar van die skulpe en die koraal nuwe en die goed wat alles tot niet gaan gaan nie. So, eh, as 'n teenwoordiger van die bloedlyntamilies van die Weskus se San gemeenskappe sê. Nameas die Paddaman Chief dat seismic aktiwiteite gaan nêrens in die Weskus van die Weskaap plaasvind nie. Op tot in Hondeklipbaai, Port Nolloth; niks. Ons gee nie toestemming nie. *So you work directly for Searcher? So, they're paying for you? So, you work for them. Even if you have your own company, you get paid by them to come and do the trick. In other words, they are a company that has been around for years. You've been doing the stuff for years. So, when you and your company got the idea of doing research in the San's territorial waters and its territory; Didn't you think you should reach out to the people, and have a conversation with those people regarding what you're thinking about right now that could potentially be development or have potential impacts on the way of life of the coastal residents? The fishing people. Now today you come up with preconceived notions without the San's free prior and informed consent involved. You never knew of the time you and Searcher communicated... Searcher had already heard the same stuff. He's just hiring another agent now. He has hired many different agents. He now appoints another agent. He'd heard from many... He never has the San communities... He invites everyone. All the communities except the San community, but he wants to dig into the San's territory and territorial waters; information come searching. We don't need your science in our archaeological area. If we want to research, we do it our way. Our indigenous way of life will determine for us how we want research done. You are not a South African company; you do not represent a South African company. South Africa does not need this gas and oil. South Africa is not such a developed country. Searcher has already told us that there is no way they can have our children trained beforehand so that they can obtain the experts on those boats. They said they couldn't do it. You have the same from them. You can't do that because those people are imported along with all. The boats, everything. The standby boats, everything comes in.* *In Australia. In New Zealand. In Canada. In America. Amerika has already ceased all its operations, its seismic activities in 2016, after environmental activists and the Khoikhoi groups, and the San groups opposed his operations, but he is in favor of climate change procedures. Now South Africa is also a country that is in favour of carbon reduction in the country, but here you come with your foreign money to mess up for Mantashe Mantashe lacks minerals. He has no natural resources. It belongs to the indigenous people who are the San communities. So, before you haven't consulted with the San*

	communities, so that we can get to this consummation together; will and will not get you permission to conduct research in our territorial waters. Because that ridge you're talking about; he extended there from the South into the North Sea. That reef is a breeding ground of our fish resources; of we food where from the world depends. You've finished poisoning the Pacific Ocean. So, where is the world going to find this important source of food other than South Africa? Nowhere but here. So, you can't come with your sound sounds. That stuff makes a massive sound sound, because it has to go all over the earth from those stone benches and it's several types of rock layers. So, as that sound; He's going down here harder, ever louder when can that thing stop that beast? He's messing up that beast more and more. So you're going to destroy our food sources. So it causes us to nullify our fish resources. Not just us fish sources; You don't show anything there about the shells and the coral reefs and the stuff that's going to go to waste. So, I, as a presenter of the bloodline families of the West Coast's San communities say, On behalf of the Frogmon Chief that seismic activities are not going to take place anywhere in the West Coast of the Western Cape. Up to Hondeklip Bay, Port Nolloth; Nothing. We don't give permission. **GP Kriel** Dankie Chief. Ek werk nie direk vir Searcher nie. Hoe dit werk is, hulle wil 'n impak studie gedoen hê, omdat hulle 'n lisensie wil hê. So, die wet sê dat hulle moet dan 'n persoon soos ons aanstel om dit te kom doen. En onthou hulle moet ons betaal of die goedkeuring gekry word of nie. So, ek wil net sê baie dankie vir dit. Dit is vir my baie belangrik dat u deelgeneem het. Dit is nie ons intensie om hierdie projek op julle te kom afdwing nie. Die idee is nie om dit te kom doen nie. Die tradisionele leierskap is vir ons baie belangrik. So, dit is hoekom ons probeer kom na die gemeenskappe toe. Dit is hoekom ons vir ons spesialiste gevra het om asseblief met julle te kom gesels. Om by julle te kom luister. Om by julle te kom hoor hoe voel julle daaroor? Wat sien julle en wat is julle persepsie oor die projek? En dit is nie om 'n ding net te kom afdwing, en te kom sê, "Ons wil vir julle kom "bulldoze" en dit is die einde van die storie nie. So, ek is jammer as dit die indruk is wat geskep is. *Thanks Chief, I don't work directly for Searcher. The way it works, they want an impact study, because they want a license. So, the law says that they must then appoint a person like us to come and do it. And remember they have to pay us whether the approval is gotten or not. So, I just want to say thank you so much for that. It is very important to me that you participated. It is not our intention to come and impose this project on you. The idea is not to come and do it. The traditional leadership is very important to us. So, that's why we're trying to get to the communities. That is why we have asked our specialists to please come and talk to you. To come visit you. To come and hear from you how do you feel about it? What do you see and what is your perception about the project? And it's not to just come and force a thing, and come and say, "We want to come and bulldoze for you and that's the end of the story. So, I'm sorry if that's the impression that was created.*
f.	**Chief Nicolaas Booysen** Ek wil net iets onder u aandag bring. U is bewus van die hofuitspraak vanoggend? So wat is die doel van hierdie proses dan? *I just want to bring something to your attention. You are aware of the court ruling this morning? So what is the purpose of this process then?* **GP Kriel** Ek is bewus daarvan, ja. Wat is die doel ...? Die hof se beslissing oor die Shell saak langs die wildeitus is 'n baie belangrike hofspraak. Ons is baie bewus van dit en dit kan redelike belangrike gevolge hê. Ons gaan ook, as EIMS, kyk na daardie hofuitspraak. Ons is tot 'n mate bewus van die tekortkominge in van die vorige prosesse , en ons het probeer om daardie goed op 'n ander manier te doen. So, ek weet in daardie

	proses het hulle nie so breedvoerig met die gemeenskappe gekonsulteer nie, onder andere. Ons probeer 'n bietjie meer hier na die gemeenskap te kom. Ons probeer by julle, as die leiers, te kom hoor en te kom sê, "Ons erken julle as die leiers in die gemeenskap, en ons erken die vissermanne se moeilikheid. En ons verstaan dat ..." In Suid-Afrika, op hierdie stadium, moet ons aansoek doen by die Departement om die goed te doen. En dan met ons die publieke deelname doen volgens daardie wette. So, ons wil glad nie wegkruip agter die feit dat daar net daardie wetgewing is nie. Dit is hoekom ons spesifiek met julle kom gesels het en by hulle wil kom hoor het. Maar ons het opgeneem, en ons gaan dit duidelik maak uit hierdie vergadering uit, dat dit is hoe julle voel as 'n gemeenskap en as die San mense. So, dit is duidelike daarso. In terme van die ander lande; hulle is nog steeds besig met hulle eie goed. Hulle het hulle eie wetgewing. Hulle eie maniere hoe hulle dit wil doen. En dit moet ook gerespekteer wees, want die idee van hierdie studie is om te kyk of hulle nie die visse gaan wegjaag nie. En as dit nou op die einde van die dag uitkom dat dit 'n groot negatiewe impak gaan hê op die omgewing, die mense, die vissers; dan sal ons sê, "Nee, ons stel nie voor dat dit aangaan nie." En dan moet daardie ouens vir ons nogsteeds betaal. Hulle betaal vir die werk wat gedoen word en nie vir die goedkeuring nie. Hulle koop nie 'n lisensie. Hulle kan nie daardie lisensie koop nie. En soos ek al in die verlede ook gesê het; daar is ouens wat dit probeer doen het en dit nie reggekry het nie. Ons job is om seker te maak dat julle gehoor word, en dat die omgewing beskerm word. *I'm aware of that, yes. What is the purpose...? The court's decision on the Shell case along the wild coast is a very important court speech. We are very aware of this and it can have fairly important consequences. We're also going to, as EIMS, look at that court ruling. We are to some extent aware of the shortcomings in some of the previous processes, and we have tried to do that stuff in a different way. So, I know in that process they didn't consult with the communities as extensively, among other things. We're trying to get to the community a little bit more here. We try to hear from you, as the leaders, and to come and say, "We recognize you as the leaders in the community, and we acknowledge the fishermen's trouble. And we understand that..."* *In South Africa, at this stage, we have to apply to the Department to do the study. And then with us doing the public participation according to those laws. So, we don't want to hide behind the fact that there's just that legislation at all. That is why we specifically came to talk to you and want to hear from them. But we recorded, and we're going to make it clear from this meeting, that this is how you feel as a community and as the San people. In terms of the other countries; they're still doing their own stuff. They have their own legislation. Their own ways of doing it. And that should also be respected, because the idea of this study is to see if they're not going to chase the fish away. And if it comes out now at the end of the day that it's going to have a huge negative impact on the environment, the people, the fishermen; then we'll say, "No, we're not suggesting this go on." And then those guys still have to pay for us. They pay for the work done and not for the approval. They don't buy a license. They can't buy that license. And as I've said in the past, too; There are guys who tried to do it and didn't get it right. Our job is to make sure that you are heard, and that the environment is protected.*
2.	**John Van Der Heever** My naam is John van der Heever. Ek sluit aan by die raadsvoor van juffrou Shoshola wat gesê het sy het as dit vyf honderd kilometer Suidoos van ons af, op die Ceres berge sneeu, dan voel ons dit hier. En dit is dieselfde wat ek dink, wat sy bedoel met die seismiese navorsing wat u beplan. Nou, ons weet Europa het 'n tekort aan energie, en daar word nou sake gedoen met energie; is die plan. Nou, hoe gaan ons voorkom dat daar breek sal kom wat betref korrupsie binne in hierdie hele proses? Hoe beplan julle om korrupsie hok te slaan, because corruption is quite prevalant in our country, and it has a huge impact on

	us as individuals, although it seems not like it be. Verder, het ek ook opgelet dat u nie eintlik juis voorsiening maak vir die voël lewe daarso nie. Dit is meestal te doen met wat op die sedliment en onder die sedliment aangaan, wat ook vir my 'n groot kommerwekkend is, want ons wat hier langs die kuslyn lewe; daar word nou 'n impak studie gemaak in die see vir natuurlike hulpbronne, maar die mees belangrike faktor wat vir my blyk te wees is die mense wat langsaan die strande bly. Soos Lambertsbaai en al die ander kusdorpe, behalwe Saldanha. Saldanha is nou meestal geïndustrialiseer nadat hulle nou baie vis uitgewis het na 'n lang tyd, en dit lyk nou byna soos 'n spookdorp, want daar staan baie wit olifante daarso. Maar die industrialisasie van Saldanha, van die hele Weskus se skiereiland; dit gebeur en ons kan sien die impakte wat dit het op die lewende marine bronne, en die ekosisteem rondom Saldanhabaai hawe. En wat bedenf die ekonomiese impak; sal ons nou nie eindlik aan ons eie bas voel nie. Maar die mense wat beleggings doen, en wat die eksplorasie werk sal doen; hulle sal die voordeel te kry van al hulpbronne, maar die hulpbronne is deel van ons se gebiedswaters. Want as dit nie gewees het nie, sou u nie vir ons gekonsulteer het oor dit wat daar sal gebeur nie. Nou hoe sal die sosio-ekonomiese impak gedoen word teenoor die mense, soos ek wat nou hier praat, en alike ander om te kyk wat is die lewensstandaarde van die mense waar u nou die hulpbron vir die wes Europa sal kom ontgin waar u dit ten duurste sal betaal. Alhoewel dit baie valuta vir ons beteken, beteken dit nie ons sal daarvan kan lewe nie, want die korrupsie, soos ek genoem het in die begin, is groot. En die mense was die geld aanmekaar tot daar waar dit nie nodig is nie. Maar die sosio-ekonomiese impak en die uitvloeisel van die bevindinge; hoe sal ons weet wat die wetenskaplikes daar aanvang en wat vir hulle lowel en wat 'n negatiewe impak kan hê. Nie net vir ons nie, maar op die ekosisteem, soos dit nou daarut sien. Baie dankie. *My name is John van der Heever. I join the metaphor of Miss Shoshola who said she had if it snowed five hundred miles South-East from us, on the Ceres mountains, then we felt it here. And it's the same thing I think, what she means by the seismic research that you're planning. Now, we know Europe has an energy shortage, and business is now being done with energy; is the plan. Now, how are we going to prevent breaks from coming in terms of corruption within this whole process? How do you plan to curb corruption, because corruption is quite prevalent in our country, and it has a huge impact on us as individuals, although it seems not like it be. Furthermore, I also noticed that you don't actually exactly cater to the bird life thereso. It's mostly to do with what's going on on the sediment and under the sediment, which is also a big concern to me because we who live here along the coastline; There is now an impact being made in the sea for natural resources, but the most important factor that seems to me to be the people who live next door to the beaches. Like Loosberts Bay and all the other coastal towns except Saldanha. Saldanha is now mostly industrialized having now wiped out a lot of fish after a long time, and it looks almost like a ghost town now, because there are a lot of white elephants standing thereso. But the industrialization of Saldanha, of the entire West Coast peninsula; it's happening and we can see the impacts it has on the living marine resources, and the ecosystem around Saldanha Bay harbour. And what spoils the economic impact; we won't actually feel on our own bass now. But the people who make investments, and who will do the exploration work; They will get the benefit of all resources, but the resources are part of our territorial waters. Because if it hadn't been, you wouldn't have consulted us about what would happen there. Now how will the socio-economic impact be done towards the people, like me who are talking here now, and every other to look at what are the living standards of the people where you will now come and exploit the resource for the western Europe where you will pay it dearly. Although it means a lot of currency to us, it doesn't mean we'll be able to live off of it because the corruption, as I mentioned in the beginning, is huge. And the people were putting the money together until there where it's not needed. But the socio-economic impact and the outcome of the findings; how will we know what the scientists are doing there and what is troubling them and what could have a negative impact. Not just for us, but on the ecosystem, as it sees from it now. Thanks a lot.*

	dP Kriel
	Mnr van der Heever, jy is doodreg. As die wind vyf honderd kilometer vêr waai van 'n berg af; ek weet ek bly daar aan die onderkant van Lesotho daar in die Oos Kaap. Ek voel 'n bergwind as hy afkom, en hy word warm. So, ek verstaan die vergelyking. En op dieselfde manier is die see nie net op een plek nie. Jy kan dalk daar iets gaan doen, en dan dink jy dit gaan net daar affekteer nie. Ons verstaan dit. Ons is heeltemal aanboord daarmee, en dit is hoekom ons 'n bietjie breër kyk. Ons kyk nie net na daardie spesifieke aansoek area nie. Ons kan nie net nie. Jy moet breër kyk as dit. In hierdie geval is die aansoek area redelik groot. So, as 'n mens breër kyk, kyk jy baie breed. En so ons kyk al die pad teen die Weskus op. Daar is selfs van die immigrasie goed wat buite die Suid-Afrikaanse waters gaan. Daar is van die skepe wat buite die Suid-Afrikaanse water gaan. So, daar is allerande impakte wat water is as dit. So, julle sal sien as ons kaarte insit van die areas, is dit baie keer kaarte vir die hele Suid-Afrika. Verstaan. So, daar is allerande goed wat 'n mens moet kyk na breë impakte waar daardie voël gaan van hieraf, en hy vlieg soentoe in die Winter. En hy gaan soentoe in die somer, en al daardie tipe goed. Dit is baie belangrik. Asluus as ek te vinnig deur die goed gegaan het, of as ek oor goed gegaan het, maar ons kyk definitief na al die voël lewe en goed ook. Dit is baie belangrik. Daar is pêdewyns. Daar is allerande voëls, seemeeue; al daardie tipe goed. So, daar is beskermde areas vir die voëls. Daar is belangrike voël areas. Al daardie goed word na gekyk as deel van die Marine ekologie. So, ons weet hulle voer op die visse in die see, en hulle vlieg oor die areas. Hulle kan ook deur die bote geslaan word; al daardie tipe goed. So, dit is belangrike goed om na te kyk, en dit is belangrik dat mense dit ook uitgewys het. So, baie dankie vir dit. Dan van die energie en goed, en waar die energie heen gaan. Op hierdie stadium kan ek nie sê nie, want die bron word nog nie uitgehaal nie. Maar wat ek weet is, ons werk binne in Suid-Afrika. Ons is binne in 'n wêreld omgewing. So, daar daar's bronne onder mekaar uitgevoer word, en hier ontgun word, en uitgevoer word vir geld en so aan, maar dan binne in Suid-Afrika ook, op hierdie stadium, het ons redelike probleme met energie. En ek dink soos hulle vantevore ook gesê het is, die tipe energie wat ons op hierdie stadium gebruik in Suid-Afrika is hoofsaaklik steenkool. En daardie steenkool, as jy hom ... En dit is die bad steenkool wat hulle brand op hierdie stadium. As jy daardie outjie brand ... Ek weet nie hoeveel van julle was al in Mpumalanga gewees nie, maar daardie areas lyk sleg. Dit lyk terrible. En dit is van die besoedelings hotspots in die wêreld, uhhhh, as 'n mens daarna gaan kyk. So, wanneer 'n mens dan gaan kyk, op 'n manier gaan ons as 'n land moet oorbeweeg na 'n ander bron van energie toe, op 'n stadium, ons daardie klimaatverandering impak ... Daardie impak is, jy weet; daardie goed te verminder. En wat die ouens nou sê, en wat die land se regering nou gesê het, is dat hulle wil transition. So, dit is die hele storie waar nou as ons sê transition, dan beteken dit ons moet eventueel by die solar panels, by die windturbines; ons moet by daardie goed uitkom. Want oos op hierdie stadium van die geveg, kan ons nie net die switch flick nie. Daar is nie genoeg sonpanele en windpanele, en hidro-elektrisiteit en allerhande ander bronne vir ons om net dit te doen nie. Dan gaan ons almal twenty-four-seven load shedding hê. So, wat ons moet doen, ons moet stadig afkiim van dit. So, wanneer 'n steenkool kragsentrale afgaan; moet ons dan oorskakel na iets soos 'n gas toe. As die gas brand, jy brand nogsteeds iets. Dit gaan nogsteeds koolstofdioksied in die lug insit, maar hy doen dit baie skoner, en hy doen dit baie minder. So, met ander woorde, dit gaan al klaar jou impak verminder. So, die uitgaste probleem is in Suid-Afrika, voer ons al ons olie en al ons gas, of die oorgroter meerderheid voer ons in. Volgens die Integrated Resource Plan moet ons daardie gas en olie hier probeer soek, sodat dit punt nommer een dalk nie so duur is om in te voer nie en dat ons dalk ons ale sekuriteit het hierso. In terme van die sekuriteit en daardie goed; al hierdie goed gebeur op hierdie stadium binne die Suid-Afrikaanse waters. Dit is wat ons noem daardie exclusive economic zone. Dit is onder die beheer van die Suid-Afrikaanse mense, en die Suid-Afrikaanse mense het die regering aangestel om sekere goed te doen.

Item No	Item
	In hierdie fase van hierdie projek; as 'n mens kyk na die sekuriteit en daardie tipe goed, dan gaan dit belangrik wees ons na daardie goed te kyk in die volgende fases. So, wanneer daardie bron daar is, en al daardie goed, moet 'n mens kyk dat dit op die regte manier bestee word. Dat daar die regte protokolle in plek is. Dat dit op die regte manier gedoen word, sodat die mense nie seer kry nie. Sodat daar nie onruste kom nie en al daardie tipe goed. So, in terme van daardie goed, is dit baie belangrik om die volgende fase te kyk na dit. Op hierdie stadium kan ons nie sê nie, want ons weet nie hoeveel olie daar is nie. Ons weet nie eers of daar enige olie daar is nie. So, hierdie is alles deel van 'n legkaart bymekaar sit, op die oueinde van die dag, om te kan kyk wat is daar. En dan kan daardie groter fase, wat meneer nou gesyn het, moet dit dan beantwoord word. Hulle moet dan later gaan kyk na daardie tipe goed, voordat hulle dan aangaan. In terme van die korrupsie. Ja, ek verstaan dat daar korrupsie in Suid-Afrika is. Daar is korrupsie regoor die wereld. Suid-Afrika het ons ongelukkig baie deurgeloop deur die korrupsie die laaste paar jare. Die laaste paar neute eintlik sekar maar. So, ons verstaan dat daar 'n hele omgewing is waarbinne in dit is, en daar is korrupsie wat plaasvind. As ons kyk na vandag se hofsaak wat uitgelewer is, dan behoort dit vir ons almal eintlik 'n belangrike ding te wees, en dit behoort vir ons eintlik 'n pluimpie te wees om te sê dat as daar iets gebeur het wat nie reg was nie, dan kan ons te minste nog iets daaraan doen. Ons het nog 'n hof wat onafhanklik is en ons kan onself na die hof toe wend en sê, "Ons stem nie saam met dit nie, ten spyte van die feit dat daar goedkeuring was en goed. So, as daar sulke ongeregtighede gebeur, dan is ek baie bly dat ons in Suid-Afrika bly waar dit te minste nog iets is wat ons kan doen daaraan, en dit kan doen. En dit is ons demokratiese reg in hierdie land om dit te kan doen, en ons moet dit gebruik. So, hierdie is nie die be all and end all nie. Daar is daardie "avenues" en ek is baie bly dat ons in Suid-Afrika bly vir dit. Onthou dan van die ekonomiese impakte. Daar gaan versekar ekonomiese impakte wees. Soos ek gesê het, jy weet, Suid-Afrika het energie nodig op hierdie stadium, so, dit is hoekom die ouens wil kyk watter energie is daar. Ons weet ons het baie son, maar ons het nog nie al die sonpanele nie. Ons weet ons het versekerlik baie wind, maar ons het nog nie al die windturbines nie. Ons weet ons het dalk baie olie, en ons het dalk baie gas. Kan ons dit vinnig genoeg uithaal? Weet ons hoeveel daar is? Al daardie vrae moet beantwoord word, maar dit is deel van die legkaart wat gebou moet word op hierdie stadium. En dit is hoekom die ouens agter dit is. So, as 'n mens gaan kyk na die needs and desirability van die hele storie; dit is hoekom hulle agter daardie hele storie aan is. Dit beteken nie net omdat daar 'n need is en dat hulle dit desire dat dit net gedoen kan word nie, en dit is hoekom daar 'n EIA proses is. Dit is hoekom daar dan 'n apel proses is. Dit is hoekom daar 'n hof is, as die dinge nie gedoen moet word so dit gedoen moet word nie. Maar die ekonomiese impak is baie belangrik. Die ekonomie ... En dit gaan tog oor, "Het ons genoeg energie, en waar gaan ons daardie energie vandaan kry." En dan moet ons dit gaan doen op die regte manier. *Mr van der Heever, you are dead right. If the wind blows five hundred miles far from a mountain; I know I live there at the bottom of Lesotho there in the Eastern Cape. I feel a mountain wind when he comes down, and he gets hot. So, I understand the comparison. And in the same way, the sea is not only in one place. You might go do something there, and then you think it's just going to affect there. We get it. We're totally on board with it, and that's why we're looking a little broader. We're not just looking at that specific application area. We can't just. You have to look broader than that. In this case, the application area is quite large. So, if one looks wider, one looks very broad. And so we look all the way up the West Coast. There is even some of the immigration stuff that goes outside the South African waters. There are some of the ships that go outside the South African water. So, there are all the impacts that have been rejected as that. So, you'll see if we put in maps of the areas, a lot of times it's maps for the whole of South Africa. Understand. So, there's all the stuff that one has to look at broad impacts where that bird goes from here, and he flies kissing in the Winter. And he goes kissing in the summer, and all that type of stuff. It is very important. Asksus if I went through the stuff too fast, or if I was about stuff, but we're definitely looking at all the bird life and stuff too. It is very important. There are penguins*

Item No	Item
	There are all-edged birds, sea gulls; all that type of stuff. Thus, there are protected areas for the birds. There are important bird areas. All that stuff is looked at as part of the Marine ecology. So, we know they feed on the fish in the ocean, and they fly over those areas. They can also be beaten by the boats; all that type of stuff. So, that's important stuff to look at, and it's important that sir pointed that out as well. So, thank you so much for that. Then of the energy and stuff, and where the energy goes. At this point, I can't say because the source isn't taken out yet. But what I know is, we are working inside South Africa. We are inside a world environment. *So, there's resources being exported amongst themselves, and here's to be disenfranchised, and exported for money and so on, but then inside South Africa as well, at this point, we have reasonable problems with energy. And I think as they said before, the type of energy that we're using at this point in South Africa is mainly coal. And that coal, if you let him... And it's the tab of coal they're burning at this point. If you burn that little guy... I don't know how many of you have been to Mpumalanga, but that area looks bad. It seems terrible. And these are some of the pollution hotspots in the world, actually, if one is going to look at them. So, when one is going to look then, in a way, we're going to have to move as a country over to another source of energy then, at some point, to that climate change impact... That impact is, you know; reducing that stuff. And what the guys are saying now, and what the country's government has said now, is that they want to transition. So, that's the whole story where now when we say transition, then that means we have to get to the solar panels, at the wind turbines; We need to get to that stuff. Because at this stage of the fight, we can't just watch the switch movie. There aren't enough solar panels and wind panels, and hydroelectricity and all sorts of other sources for us to do just that. Then we're all going to have twenty-four-seven load shedding. So what we have to do, we have to slowly get off it. So, when a coal-fired power plant goes down; should we then switch to something like a guest. If the gas is burning, you're still burning something. It's still going to put carbon dioxide into the air, but he's doing it a lot cleaner, and he's doing it a lot less. So, in other words, it's already going to reduce your impact. So, the only problem is in South Africa, do we import all our oil and all our gas, or the vast majority of us import. According to the Integrated Resource Plan, we should try to look for that gas and oil here, so that point number one may not be as expensive to import and we may have our own security hereso.* *In terms of the security and that stuff; all this stuff is happening within the South African waters at this point. That's what we call that exclusive economic zone. It is under the control of the South African people, and the South African people have appointed the government to do certain things.* *In this phase of this project; if one looks at the security and that type of stuff, then it's going to be important to look at that stuff in the next stages. So, when that source is there, and all that stuff, one has to see that it's spent the right way. That there are the right protocols in place. That it's done the right way, so the people don't get hurt. So that there aren't any unrests coming and all that type of stuff. So, in terms of that stuff, it's really important to watch the next phase after that. At this point, we can't say because we don't know how much oil there is. We don't even know if there's even oil there. So, this is all part of putting a puzzle together, at the end of the day, to be able to see what's there. And then that longer phase, which Sir has now asked, it must then be answered. They then have to go and look at that type of stuff later, before they then move on. In terms of the corruption. Yes, I understand that there is corruption in South Africa. There is corruption all over the world. South Africa, unfortunately, has seen us through a lot through the corruption over the last few years. The last few centuries actually sure but. So, we understand that there's a whole environment that's in there, and there's corruption that's taking place. If we look at today's court case that has been handed down, then it should actually be an important thing for all of us, and it should actually be a feather in our cap to say that if something happened that wasn't right, then at least we can still do something about it. We have another court that is independent and we can go to court and say, "We don't agree with that, despite the fact that there was approval and stuff. So, if such injustices happen, then I am very happy that we live in South Africa where it is at least*

	another thing we can do about it, and do it. And it is our democratic right in this country to be able to do that, and we should use it. So, this is not the be all and end all. There are those "avenues" and I am very happy that we are staying in South Africa for it. *Then remember about the economic impacts. There are going to be economic impacts for sure. Like I said, you know, South Africa needs energy at this point, so, that's why the guys want to see what energy is there. We know we have a lot of sun, but we don't have all the solar panels yet. We know we have an awful lot of wind, but we don't have all the wind turbines yet. We know we may have a lot of oil, and we may have a lot of gas. Can we get it out fast enough? Do we know how many there are? All those questions need to be answered, but it's part of the puzzle that needs to be built at this point. And that's why the guys are behind it. So, if one is going to look at the needs and desirability of the whole story; That's why they're after that whole story. It doesn't just mean that there's a need and they want it to just be done, and that's why there's an EIA process. This is why there is then an appeal process. That's why there's a court, if the things shouldn't be done so they should be done. But the economic impact is very important.*
h.	**Nikkie Alfreds** Baie dankie. Ek wil net deel met die vorige sprekers wat hier gesê het, wat gepraat het, maar ek is Nikkie Alfreds van Lambertsbaai. Ek is 'n visserman en ek is 'n gemeenskapsleier. Die vorige sprekers het hier gepraat van, "hier is baie min vissermanne," maar hierdie Lambertsbaai is 'n bona fide vissergemeenskap. Ons is 'n vissergemeenskap. Ons boer nie met aartappels nie, en dit nie. Ons se ouers het vir ons groot gemaak uit die Marine bron uit. So, hierdie Lambertsbaai is 'n vissergemeenskap. Daar dit nou weer vir ons oortuig wat die minister nou uitgegee het by OEF, vyf-en-veertig by die kleinskaal se vissermanne, is daar vyf-en-veertig mense wat nou gekwalifiseer is vir 'n kleinskaalse vissermanne, wat 'n permit gekry het om die reg tot Marine bron. Ek wa af wat die visserman is, "Waar is my reg?" Want ek is 'n agter lewende vissergemeenskap; ek het 'n reg tot Marine bron. Ek het 'n reg om te lewe. Ek het 'n reg om te werk. Waar is my reg? Hoekom moet vem ons mense vir ons klaar kom identifiseer en te sê, "Jy is nie 'n visserman nie." Maar ons is 'n vissergemeenskap. Ek is baie bekommerd oor hier Lambertsbaai, want ons dorp het nie ekonomiese. Ons kinders is werkloos. Niemand van hierdie leiers, as hulle hier kom in 'n vergadering, praat hulle nie oor die nood van Lambertsbaai nie. Hulle praat oor hulleself. Julle gaan die bron beskadig. Julle sal dit doen. Elkeen het sy werk. Julle het navorsing gedoen om te kyk hoe kan julle die bronne beskerm. Maar dan hoort daar nogsteeds vir jou gevra, "Hoe lank is jy in die bedryf? Hoe lank doen jy hierdie werk?" Ons is nie daar om vir julle kom hakkel vir hoor te doen nie. Ons is daar, want ons soek hulp. Ons vra, "Hoe kan ons ons dorp se ekonomies ontwikkel? Hoe kan ons ons kinders werk gee? Ons kinders by honger. Ons kinders staan op die straat. Hulle het nie kos nie. Ek praat van, "Dit is wat die leiers moet doen." By elke vergadering ... Ek was nou in die Kaap gewees vir vier dae. Het hulle my uitgenooi na 'n konferensie toe. En ek het gegaan uit Lambertsbaai uit; nie vir my nie. Ek het nie geloop vra vir koelte nie. Ek het gegaan na die minister toe en ek het vier werkskepping projekte gehad wat ek vir hulle gewys het. Ek kom doen 'n pleidooi aan die minister vir Lambertsbaai se ekonomies en werkskepping vir ons jeug. Dit is die vier projekte wat ek van praat. Is die toilet fabriek, die stene projek, die dakplate fabriek, die galvaniese pot waar ons jong kinders kan sweis en as hulle klaar gesweis het en die veiligs dekte daarin sit sodat die ... Dit het ek gegaan na die minister toe. Ek het nie gegaan vir myself nie, want Lambertsbaai het 'n nood. En Lambertsbaai se nood is werkskepping projek. En as ek kyk na die langtermyn projek wat die gas, gaan dit tog vir ons help in die langtermyn. Nou, ons sal baat vind daaruit, want die opbrengs van daardie olie en gas kan ingeploeg word vir ons gemeenskap vir ander projekte wat kan gedoods word vir ons jong kinders wat hier buite loop. Matrikulante wat nie meer kan studeer nie. Wat nie kan meer loop leer nie. Daar kan ons ons se hulp

	van kry van daardie bronne af, want die Here gee die bronne. Nie 'n mens nie. Die Here gee vis uit die see. Hy gee hulpbronne ook. Nou maar laat ons die hulpbronne geniet. Hoekom mag ons nie die hulpbronne geniet as 'n gemeenskap nie? As die vis oor drie jaar weg is, en hier is nie vis in Lambertsbaai nie. Dan kom wat? Armoede. Verdrukking kom onder ons mense. Hier is nie werk nie. Maar daar was 'n hulpbron gewees in die see wat die Here gegee het. Olie waarvandaan ons kon gelewe het. Wat kan ingeploeg gewees het, wie as 'n gemeenskap het. Ons moet nie net kyk van die toilet fabriek nie. Ons moet kyk na landbou om nywerheid. Hoe kan ons ons se dorp se ekonomies ontwikkel? Wat kan ons doen met die grondie wat hier lê? Dan wil ek net terugkom na die vorige leier wat gepraat het ook, van die inheemse volk. Ons is verdeeld, want hulle kan nie vir ons nie, want toe ek hier staan, soos ek hierso staan, is ek 'n Khoisan. Ek is 'n Khoisan. My ma kom uit Namakwaland uit. My ma is 'n Khoisan. Maar raai hoekom is ek nie deel van die Khoisan nie? Omdat die leiers nie vir ons erken as 'n Khoisan nie. Hulle dink net aan hulleself. Dan verstaan ek nie. Ek vat niemand aan nie. Ek vertel vir niemand 'n ding nie. Die punt is net hier. Ons mense kry te swaar. Ons kinders kry swaar. Vyf-en-veertig vissersmanne kan nie Lambertsbaai se ekonomies ... Hulle kan nie Lambertsbaai se gemeenskap wees nie. Lambertsbaai het 'n vissersgemeenskap. Almal moet die reg hê tot .. Ek gee nie om vir daardie vyf-en-veertig mense nie. Hulle het hul se reg gekry, maar wat van my? Daardie vyf-en-veertig kan verremôre see toe gaan. Hulle kan vis loop vang. Hulle kan vir hulle kreef vervang. Wat kan ek op die tafel sit? Wat van jou broer, wat ook 'n visserman is, wat ook 'n vissersgemeenskap is? Waarvan moet hy lewe? Maar jy het die reg. Jy kan verremôre see toe gaan. Jy kan loop kreef vang. Jy het kos op jou tafel, maar jou broer en jou sister sterf hier langs jou van honger te, want hulle het nie reg tot marine bron nie. Dit is nie reg nie. Ek is nie hier om niemand aan te vat nie, maar die punt is net die fokus op Lambertsbaai se ekonomies en gee werksskepping vir jou kinders, dat jou kinders kan lewe. Dit is dan nie 'n probleem nie. Almal lewe lekker. Dit is waarvan ek ... Wil net sê, " Ek het niks teen 'n leier nie. Ek het niks teen kom aan nie. Maar die punt is net die, "fokus op jou dorp se ekonomies." *Thanks a lot. I just want to share with the previous speakers who said here, who spoke, but I'm Nikkie Alfreds from Lamberts Bay. I'm a fisherman and I'm a community leader. The previous speakers here spoke of, "there are very few fishermen here," but this Lamberts Bay is a bona fide fishing community. We are a fishing community. We don't farm potatoes, and we don't. We're parents raised for us from the Marine source. So, this Lamberts Bay is a fishing community. There it now convinces to us again what the Minister has now given out at DEF, forty-five by the small scale's fishermen, there are forty-five people who are now qualified for a small-scale fisherman, who have been granted a permit to establish the right to Marine source. I ask myself what the fisherman is, "Where is my right?" Because I'm a bekkod living fishing community; I have a right to Marine source. I have a right to live. I have a right to work. Where is my right? Why do some of our people have to come and identify and say, "You're not a fisherman." But we are a fishing community. I am very concerned about here Lamberts Bay, because our town is not economic. Our children are unemployed. None of these leaders, when they come here to a meeting, they don't talk about the plight of Lamberts Bay. They talk about themselves. You're going to damage the source. You'll do it. Everyone has his job. You guys have done some research to see how can you protect the sources. But then you should still be asked, "How long have you been in the industry? How long have you been doing this job?" We're not there to come and fight for you to hear. We are there because we seek help. We ask, "How can we develop our town's economically? How can we give our children jobs? Our children are starving. Our children are standing on the street. They don't have food. I'm talking about, "This is what the leaders need to do." At every meeting... I have now been to the Cape for four days. Did they invite me to a conference. And I went out of Lamberts Bay; Not for me.* *I didn't walk asking for coolness. I went to the minister and I had four job creation projects that I showed them. I come and make a plea to the Minister for Lamberts Bay's economic and job creation for our*

	youth. These are the four projects I'm talking about. Is the toilet factory, the bricks project, the roof slabs factory, the galvanic pot where we can weld young children and when they have finished welding and put the safe covers in it so that the ... This I went to the Minister. I didn't go for myself because Lamberts Bay has an emergency. And Lamberts Bay's emergency is job creation project. And when I look at the long-term project that the gas, it's still going to help us in the long run. Now, we will benefit from that, because the proceeds of that oil and gas can be ploughed in for our community for other projects that can be launched for our young children who are walking out here. Matriculants who can no longer study. What can't learn more walking. There we can get our help from those sources, because the Lord gives the resources. Not a human being. The Lord gives fish from the sea. He gives resources as well. Well, let's enjoy the resources. Why aren't we allowed to enjoy the resources as a community? If the fish are gone in three years, and there is no fish here in Lamberts Bay. Then comes what? Poverty. Tribulation comes among our people. There's no work here. But there was a resource in the sea that the Lord gave. Oil from which we could have lived. What could have been plowed in, who has as a community. We shouldn't just be watching from the toilet factory. We need to look at agriculture for industry. *How can we develop our town's economic development? What can we do with the soils that lie here? Then I just want to come back to the previous leader who spoke as well, of the indigenous people. We are divided because they do not know us, because when I stood here, as I stood here, I am a Khoisan. I am a Khoisan. My mother is from Namaqualand. My mother is a Khoisan. But guess why I'm not part of the Khoisan? Because the leaders do not recognize us as a Khoisan. They think only of themselves. Then I don't understand. I don't take on anyone. I don't tell anyone a thing. The point is right here. Our people are suffering. Our children are suffering. Forty-five fishermen cannot access Lamberts Bay's economically... They cannot be Lamberts Bay's community. Lamberts Bay has a fishing community. Everyone should have the right to... I don't care about those forty-five people. They got their due, but what about me? Those forty-five can go to sea this morning. They can catch fish walking. They can substitute crayfish for them. What can I put on the table? What about your brother, who is also a fisherman, who is also a fishing community? What should he live on? But you are right. You can go to the sea tomorrow. You can catch walking crayfish. You have food on your table, but your brother and your sister are dying of hunger here beside you, because they don't have a right to marine source. That's not right. I'm not here to take on anyone, but the point is just the focus on Lamberts Bay's economic and giving job creation to your children, that your children can live. That's not a problem then. Everyone is having a good time. That's what I... just want to say, "I have nothing against a leader. I have nothing against him. But the point is just the, "Focus on your town's economic."* **Nikoleas Booysen** **Baie dankie daarvoor. Ja. Ek gaan daardie kommentaar so opvat en dit neerskryf. Ek kan ongelukkig nie kommentaar lewer oor die vissersregte en daardie goed nie. So, ek verstaan dat dit 'n redelike storie is, maar, ja, baie dankie vir daardie kommentaar. Ek waardeer dit. Baie dankie.** *Thank you so much for that. Yes. I'm going to take those comments up like this and write them down. I can't comment on the fishing rights and that stuff, unfortunately. So, I understand that this is a reasonable story, but, yes, thank you very much for those comments. I appreciate it. Thanks a lot.*
3	**Male Speaker** **Ja, meneer. Ek voel nou so gaskok, want ek is 'n visser; ek is deel van vyf-en-veertig, maar ek is dertig jaar 'n visser. So, al wat ek wil weet by u. U het mos nou o navorsing gedoen u se wel aan, en alles die. Sê maar u kry daardie permit en o loop prospek. Julle prospek nou eers. Hoe lank wat dit, want because why, ky gaan die natuur seer maak. Definitief. Gaan so 'n ding die koraalrif seermaak, en hoe lank vat dit, vir daardie ding om daardie rif te herstel of wat gaan julle doen om iets aan daardie rif te doen, waar**

	julle mikkien skade gedoen het. En hoe lank vat dit vir so 'n koraalrif herstel? Het julle al nawersing gedoen of wat? Want because why soos ek hoor. Julle gaan nie net op een plek prospek nie. So, julle gaan van daar waar julle skade doen, hoe lank vat dit om daardie ding se ... Laat daardie gebied kan herstaal, en so. *Yes sir. I feel so shocked now, because I'm a fisherman; I'm part of forty-five, but I've been a fisherman for thirty years. So, all I want to know from you. You've now done your research you're grazing on, and all the. Just say you get that permit and you walk prospect. You're only now prospecting. How long what it, because because why, he's going to hurt nature. Sure thing. Is such a thing going to hurt the coral reef, and how long does it take, for that thing to repair that reef or what are you going to do to do something about that reef, where maybe you did some damage. And how long does it take for such a coral reef to recover? Have you guys done any research or what? Because because why as I hear. You're not just going to prospect in one place. So, you go from there where you do harm, how long does it take to get that thing's... Let that area be able to re-language, and such.* **GP Kriel** Ekskuus, op hierdie stadium is ons studie nog nie heeltemal klaar nie. So, ek kan nog nie vir jou honderd persent duidelikheid gee daaroor nie, maar dit is een van die dinge waarna die spesialiste moet kyk. So, hulle moet kyk .. Okay, so, as hierdie impak is groot of klein, of wat ookal is en waar hy gaan oral plaasvind, en dan gaan kyk julle na wat se spesifieke impak gaan hy hê op watter organisme. En hoeveel organismes dink hulle gaan hy ... Gaan dit grootskaalse skade wees. Gaan hy kleiner skade wees. En dan gaan ... Wat ons probeer doen is, ons probeer daardie skade so min as moontlik maak. En ons doen daardie versagtingsmaatreël of 'n mitigation measure. Maar die herstel van daardie ding word ook bepaal oor die grootte van die impak, en waar jy dit gedoen het en daardie goed. So, die spesialiste is daar veronderstel om daardie goed in te sit, en dan moet hulle sê, "Okay, die herstelling gaan so lank vat, en as daar dan 'n grootskaalse versteuring gewees, gaan ek lieber sê, "Liewerste, moet nie dit doen nie, of wat ookal. Die herstel kan 'n dag wees. Dit kan twee dae wees. Dit kan 'n paar maande wees. Of dit kan 'n permanente impak wees. Ons is besig om al daardie nommers bymekaar te sit, en te kyk. En dan sal ons vir julle kom terugvoering gee in EIA oor daardie goed. *At this point, our study is not quite finished yet. So, I can't give you one hundred percent clarity on that yet, but it's one of the things that the specialists need to look at. So, they have to look... Okay, so, if this impact is big or small, or whatever is and where he's going to take place everywhere, and then you guys are going to look at what specific impact is he going to have on which organism. And how many organisms do they think he's going to... is it going to be massive damage. Is he going to be smaller damage. And then go... What we're trying to do is, we're trying to make that damage as little as possible. And we do that mitigation measure or a mitigation measure. But restoring that thing is also determined by the size of the impact, and where you did it and that stuff. So, the specialists are supposed to put that stuff in, and then they have to say, "Okay, the restorement is going to take so long, and if there's been a large-scale disturbance, I'm going to say, "Rather, don't do this, or whatever. The recovery can be a day. It can be two days. It may be several months. Or it could be a permanent impact. We're in the process of putting all those numbers together, and watching. And then we'll come and give you feedback in EIA on that stuff.*
J.	**Rosey Shoshola** Ja, ek wil net vir Mnr Bezuidenhout sê, baie dankie vir daardie baie mooi verduideliking rondom die werkskepping. En nou weet die jeug ook hoe prosesse gaan werk en dat daar nie, soos in onmiddellik, vir hulle gaan werk wees nie, maar wel in die langtermyn, sou die goed suksesvol is. So, baie dankie Mnr Bezuidenhout. Dit was baie mooi verduidelik in ons taal. En dan as ons praat oor werkskepping, nê, dan

	kyk ek na 'n snoek-run in Lambertsbaai. Dan sien ek vissers van regoor die Suid-Afrika kan kom werk in Lambertsbaai. Uit die snoek uit kan hulle vir hulle gesinne sorg. Ek praat van meer as twee honderd kommersiële bote wat vir snoek-run, in Lambertsbaai kom, en een boot wat rondom tien crew manne. Dan praat ek nie eers van die hawe werkers nie. Ek praat nou nie eers van die vroue wat op die hawe, 'n inkomste maak deur kos te verkoop nie. As ons al daardie klomp mense bymekaar tel, dan vra ek vir myself, die werkskepping waarna Mnr Bezuidenhoot verwys het wat oor 'n paar jaar kan gebeur; die moontlikheid daarvan. Dan vra ek, "Kan dit opmaak vir die verlies aan inkomste vir die vissers wat hulle lewe uit die see uitmaak. Baie van die vissers is vyftig jaar en ouer. Waar het hulle nou lus om 'n nuwe skill te gaan leer op daardie ouderdom? Hulle kan net visvang al die jare. Dit is nou wat die Searcher vir ons kan gee. Die werk wat die visserye vir ons gee. Wat is die werk wat uit hierdie projekte uit kan kom? En dan wil e knok baie graag weet, wat vir my 'n groot bekommernis is, is die rehabilitasie van die bron. Sou julle julle surveys doen en gestel julle kry niks; dan is daar reeds skade aan die bron gedoen. Hoe gemaak om daardie skade te herstel, sodat ons kan voortgaan met ons aktiwiteite? Sou julle olie of gas kry daar waar julle drill, dan gaan dit weer 'n ander effek hê. Julle gaan definitief wil kom delf. En die boodskap gaan uit, internasionaal, né. Wat huidiglik gebeur met ons se visvaters is; in die diep merk ons Sjinese bote op; Japanese bote op, wat kom poech in ons se waters. En die regering het nie beheer oor daardie mense nie. Sou die boodskap uitgaan dat die olie en gas in ons se waters gevind word; wat dink julle gaan gebeur met die ander maatskappye wat ook opsoek is na olie en gas. Julle gaan lets soos wat jare terug gebeur het met Kimberley-hulle en Upington-hulle, toe die mense daar eeue terug diamant ontdek. Mense het eeue gelede diamante ontdek en dit het 'n toestroming van alle karakters veroorsaak. En dan wil ek terugkom na vissers en wie is die vissers. As ek praat van die vissers, dan praat ek van die visters wat hulle lewe maak uit die see uit. Wat opstaan in die oggend en daardie koue water gaan trotseer om 'n Hotnotvissie of 'n Jakoppie te vang om vannaand vir sy gesin te kom voorsit. Dit is 'n visser. Ek praat van 'n vrou wat in die oggend opstaan. Dan sien sy hier is niks kos in haar huis nie. Dan stap sy oor strand toe en sy gaan vergader skulpe, mossels, om vir haar gesin te kom kos op die tafel sit. Ek praat nie van mense wat, met 'n skipper sertifikaat sit, maar hy is daar in 'n vertoonkas by die huis nie. En dan wil ek ook sê dat die vissers van Lambertsbaai is nie mense wat geidentifiseer word deur Departement nie, want Departement identifiseer enige een as 'n visser. Ons as vissers, wat werk op die oseaan. Wat betrokke is by die naprosessering van die oseaan; ons is die mense wat hongersnood in die oë staar. En as dit kom by uitreiking van permitte; ons kan nie daarvoor help nie. Ek hoor die vorige spreker praat van vyf-en-veertig permitte. Dit is vêr van die waarheid af. Huidiglik in Lambertsbaai, is daar amper twee honderd permitte. As ons kyk na interim small-scale; dan sit ons met 'n getal van honderd-en-twaalf mense op daardie permit. As ons kyk na die near-shore, dan sit ons met amper vyftig mense. As ons kyk na hywis permitte; dan sit ons ook met heelwat vissers. Vissers wat deur Departement geidentifiseer is. As my buurman 'n permit kry en ek kry nie 'n permit nie; kan ek nie vir my buurman kwaad wees nie. Dit is nie sy skuld nie. Dit is Departement. En dan wil ek ook vir die vorige spreker, Mnr Alfred, sê baie dankie dat jy kyk na werkskepping, maar dan wil ek ook in dieselfde asem vir jou vra dat jou projekte waarmee jy besig is, moet nie 'n inruil proses wees vir ons se oseaan nie. Gaan aan met jou goed. Gaan jou support Oom Nikkie. Gaan aan met jou werkskeppingsprojekte vir die jeug, maar dit kan nie wees inruil vir, sê ja vir Searcher nie. Daardie projekte moet verwyder word van seismic se surveys, want as ek hoor die beplanning wat u het is goed, maar dit het niks te doen met die oseaan en die voorlegging wat vandag hier gedoen is nie. En dan wil ek ook sê, met alle respek, en mense kan vir my kwaad wees vandag tot in hulle grafte; Mnr Alfred sal vir Searcher wees vir surveys en gekant wees teen die voortbestaan van tradisionele visserye, want hy persoonlik maak nie sy lewe uit die see uit nie. Hy was plus minus dertig jaar gelede nog op 'n pelagiese boot. Dertig jaar gelede omtrent was hy op 'n pelagiese boot, maar 'n Nieniskaalse visser is hy nie, want ek nog nooit gesien hy vang Hotnot visse or snoek nie. Hy face nie die bekommernisse wat ons "face" nie. Hy lê nie nagte wakker soos ons wakker lê, wat se brood en botter, daagliks op hierdie

	oombêk, uit die oseaan uit kom nie. Mnr Alfred het hierdie vissers ge-fail jare gelede met SACFH. Hy het die hele see beslt. Die hele see het hy besit, onder sy leiding. Die vissers van Lambertsbaai het 'n permit gehad wat alles ingesluit het. Tonne, tonne. Dan kry die vissers, die einde van die jaar, 'n R300.00 uit al daardie spesies uit, wat aan hulle toegeken is, onder leiding van Mnr Alfred. Ek wil hom nie te nakom nie. Ek praat net die waarheid. Ons vissers is gefail. Hy het ons gefail. Vandag wil hy kom en sê ons moet saamstem dat ons ons se waters moet weggee vir eksplorasie projekte. Ons kan nie meneer. Dit is ons se livelihood. Ons het nie 'n ander livelihood nie. Ons kan nie ander werk nie. Ons ken visvang. Ons kan vis skoonmaak. Ons ken mossels vergader. Ons kan skulpe vergader. Ons ken lewe uit die see uit. Baie dankie. *Yes, I just want to say to Mr Bezuidenhout, thank you so much for that very nice explanation around the job creation. And now the youth also know how processes are going to work and that there is not going to be work, as in the long term, if there is going to be work for them, but in the long run, the stuff would be successful. So, thank you very much Mr Bezuidenhout. It was very nicely explained in our language. And then when we talk about job creation, eh, I'm watching a pike run in Lamberts Bay. Then I see fishermen from all over South Africa can come and work in Lamberts Bay. Out of the pike, they can take care of their families. I'm talking about over two hundred commercial boats coming for pike-run, in Lamberts Bay, and one boat coming around ten crew men. Then I'm not even talking about the port workers. I'm not even talking about the women who, on the port, make an income by selling food. If we take all that bunch of people together, then I ask myself, the job creation that Mr. Bezuidenhout referred to that could happen in a few years; its possibility. Then I ask, "Can this make up for the loss of income for the fishermen who make up their lives from the sea. Many of the fishermen are fifty years and older. Where do they feel like going to learn a new skill at that age? They've only known fishing all these years. Now that's what the Searcher can give us. The work the fisheries give us. What is the work that can come out of these projects? And then a kook would really like to know, what is a big concern for me is the rehabilitation of the source. Would you do your surveys and suppose you get nothing; then damage has already been done to the source. How made to repair that damage so we can continue our activities? If you get oil or gas where you drill, it's going to have a different effect again. You're definitely going to want to come and dig. And the message goes out, internationally. What's happening to us right now is fishing waters; in the deep we notice Chinese boats; Japanese boats op, which come poach in our waters. And the government doesn't have control over those people. Should the message go out that the oil and gas are found in our waters; What do you guys think is going to happen to the other companies that are also looking for oil and gas. You go something like what happened years back to Kimberley-them and Upington-them, when the people there discovered diamond centuries back. People discovered diamonds centuries ago and this caused an influx of all characters. And then I want to get back to fishermen and who are the fishermen. When I speak of the fishermen, I am talking about the fishermen who make their living out of the sea. Who gets up in the morning and is going to brave that cold water to catch a Hotnot fish or a sakeppie to come and serve his family tonight. It's a fisherman. I'm talking about a woman who gets up in the morning. Then she sees there's nothing food in her house here. Then she walks across to the beach and she goes to meet shells, clams, to come and put food on the table for her family. I'm not talking about people who, sitting with a skipper't certificate, but he's there in a display case at home. And then I also want to say that the fishermen of Lamberts Bay are not people identified by Department, because Department identifies any one as a fisherman. We as fishermen, who work on the ocean. What is involved in the postprocessing of the ocean; We are the people facing famine. And when it comes to issuing permits; we can't help it. I hear the previous speaker speak of forty-five permits. This is far from the truth. Currently in Lamberts Bay, there are almost two hundred permits. If we look at interim small-scale; Then we put a number of one hundred and twelve people on that permit. If we look at the near-shore, then we are left with almost fifty people. If we look at line fishing permits; Then we also sit with quite a few fishermen. Fishermen identified by Department. If my neighbor gets a permit and I don't get*

	a permit; can't I be mad at my neighbor. It's not his fault. This is Department. And then I also want to say to the previous speaker, Mr. Alfred, thank you so much for looking at job creation, but then in the same breath I also want to ask you that your projects that you're doing shouldn't be a trade-in process for us ocean. Get on with your stuff. Go support you Uncle Nikkie. Get on with your job creation projects for youth, but they can't be trade-ins for, say yes to Searcher . *Those projects should be removed from seismic's surveys, because when I hear the planning you have is fine, but it has nothing to do with the ocean and the submission that was done here today. And then I also want to say, with all due respect, and people can be angry with me today all the way to their graves; Mr Alfred will be to Searcher for the survival of traditional fisheries, because he personally does not make his life out of the sea. He was plus minus thirty years ago still on a pelagic boat. Thirty years ago he was on a pelagic boat, but a small-scale fisherman he is not, for I have never seen him catch Hotnot fish or pike. He doesn't face the worries we face. He doesn't lie awake at night as we lie awake, whose bread and butter, daily at this moment, come out of the ocean. Mr Alfred failed these fishermen years ago with SACFN. He owned the whole sea. The whole sea he owned, under his direction. The fishermen of Lamberts Bay had a permit that included everything. Tons, tons. Then, at the end of the year, the fishermen get a R300.00 out of all those species, which was awarded to them, under the leadership of Mr Alfred. I don't want to honor him. I'm just telling the truth. Our fishermen have been failed. He failed us. Today he wants to come and say we have to agree that we should give away our waters for exploration projects. We can't sir. It's ours. We don't have another. We don't know other jobs. We know fishing. We know fish cleaning. We know clams gather. We know shells assemble. We know life out of the sea. Thanks a lot.* **GP Kriel** Dit is belangrik om te onthou dat hierdie is nie 'n eksklusiewe area nie. Daar is baie dinge wat in die see kan gebeur, né. So, mens kan nie net sê, "Net visserye in die see, en net olie in die see, of net gas in die see. Mens gaan moet kyk, eventueel, is daar 'n manier dat altwee op dieselfde tyd kan gebeur of nie. En dit is 'n besluit wat ons moet maak, deur te kyk na die impakte. Deur te kyk na hierdie prosesse, en te sê. As hierdie aangaan, gaan die vissermanne bedreig word? Gaan hulle broone vermiesig word? Gaan al daardie goed gebeur?" Want die ouens daar buite; daar is industriële vissers, daar is ouens wat anywese doen. Daar is ouens wat vir olie en gas kyk. Daar is ouens wat met ons waters gebruik om deur te vaar. Daar is Marine kabels wat daardeur gaan. Daar is beskermde areas. Daar is 'n groot klomp dinge wat in die see gebeur, en op die land gebeur in ons land, en ons kan nie net sê, net vissers nie. So, dit is hoekom ons kom kyk na al daardie goed op dieselfde tyd, op dieselfde manier. So, ons kan nie. Ons moet gaan kyk, "Gaan dit daardie verskillende goed affekteer of nie? En dit is baie belangrik dat ons nie net met oogklappe so aan kyk na die storie nie. Die werkskepping; dit is baie belangrik om te kyk of daar gaan 'n verlies wees en goed, maar op hierdie stadium gaan ons kyk wat die impak is, en as daar grootskaalse impak is op die omgewing, en daardie tipe goed, dan sal daar dan ander impakte wees en goed. En dan sal 'n mens dan moet twee keer dink of dit gaan aangaan. So, ons sal nou gaan kyk. Ons sal dit gaan kwantifiseer en dan gaan kyk of dit eintlik 'n groot ding gaan wees. So, in daardie geval, gaan ons dan in 'n groter detail in die stappe wat hierna kom, sal 'n mens dan die groter impak en die ekonomiese goed kan doen. Ek wil nie betrokke raak by die debat hier op die dorp nie, maar ek verstaan dit is deel van die sosiale omgewing. Ek verstaan daar is geskiedenis op die dorp. Daar is geskiedenis in ons land. En dit is belangrik dat ons dit ook verstaan. So, baie dankie vir almal se insette daar.
8.	**Nikolaas Booysen** Dankie. Die saal is nou eintlik leeg. Mense se uitgangspunt oor werkskepping in hulle dorp. Hulle is vissergemeenskap. Hier is opportunities vir werkskep. Dit is maar net, ons moet uitreik na ons leierskap

	met ons se idees en die gebous in ons se hawens kan ons uitwys vir die seker projekte wat ons wil hê. Dan kan die prosesse aangaan, maar dit is maar net verdeeldheid in die gemeenskap bring laat niemand wil met sekere leierskappe saamwerk om sekere goal te achieve. So, daardie gesels random werkskepping. Dit is vir die gemeenskap om alleen byeekaar te kom en hulle werkskepping inisiatiewe uiteen te sit, maar weereens as die Goeriqua stam van die Weskus, versoek ek u om met die stamleiers in konsultasie te tree rondom hierdie projek. Want soos ek sê, en ek benadruk dit, dat ons was ooit geken in u konsultasie prosesse nie. Tot vandag toe was ons nog nie geken nie. Although is ek hier. Ek het opgedaag hier as gevolg van die advertensies. Die manner weet hoe werk die prosesse van free prior and informed consent und in terms of daardie prosesse. En die UNDRIP, en die NEMA Act, die NAGOIA protocol. judgement en almal daardie dokumentasie gaan kyk, dan sal jy sien hoe u met die inheemse gemeenskap, net soos u met die tradisionele gemeenskappe ge-engage het, moet u met die inheemse gemeenskappe engage om die issues klear aan te kry. *Thank you. The hall is now actually empty. People's premise about job creation in their town. They are fishing community. Here are opportunities for job creation. It's just, we need to reach out to our leadership with our ideas and the buildings in our ports can point us out for the sure projects we want. Then the processes can go on, but it's just bringing division into the community let no one want to work with certain leaderships to achieve certain goal. So, that chatter around job creation. It is for the community to come together alone and outline their job creation initiatives, but again as the Goeriqua tribe of the West Coast, I urge you to consult with the tribal leaders around this project. Because as I say, and I stress this, that we were never known to your consulting processes. To this day, we were not yet known. Although I'm here. I showed up here because of the ads. The gentleman knows how do the processes of free prior and informed consent and in terms of those processes work. And the UNDRIP, and the NEMA Act, the NAGOIA protocol. judgement and everybody's going to look at that documentation, then you'll see how your engage with the indigenous community, just like you've engaged with the traditional communities, you have to engage with the indigenous communities to get the issues done.* **GP Kriel** Ek sê baie dankie. Julle is nog steeds welkom om ons te bel, of ons e-pos te stuur of wat ookal. Ons sal julle dan op hoogte hou van hierdie proses verder loop. Dankie dat julle gekom het. Ek waardeer dit en ons sien julle weer. Dankie. *I say thank you very much. You're still welcome to call us, or email us, or whatever. We will then keep you updated on this process going on. Thank you for coming. I appreciate it and we'll see you again. Thank you.*

Teks in *italics* is uit die Afrikaanse teks vertaal. *Text in italics has been translated from the Afrikaans text.*

'n Openbare vergadering is geskeduleer tydens die vooraansoektasse met die Belanghebbende en Geaffekteerde Partye (I&APs). Die doel van die vergadering was om die aanvanklike bekommernisse van die lede van die publiek en belangrike I&APs vas te lê. Tydens die openbare vergadering wat tussen 16:00 en 18:00 plaasgevind het, is 'n aanbieding van die projekbeskrywing, voorlopige impakassessering, projekspan en projektydraamwerke aan alle deelnemers van die vergadering deur Environmental Impact Management Services (EIMS) Pty (Ltd) gelewer. 'n Aanbieding is deur mnr GP Kriel van EIMS in Afrikaans gelewer. SEICHE het 'n aanbieding gelewer oor die omgewingsversagting wat tydens seismiese opnames in terme van die Marine Soogdier Waarnemer (MMO) en Visserykalbeampte (FLO) in Afrikaans uitgevoer is. Die aanbieding is deur mnr Rudian Baily gelewer. Nadat die aanbiedings afgelewer is, is 'n vraag- en antwoord sessie geopen waar deelnemers vrae gevra het of hul kommentaar oor die projek uitgespreek het. Die bywoningsregister is aangeheg as 'n aanhangsel tot hierdie dokument.

A Public Meeting was scheduled during the pre-application phase with the Interested and Affected Parties (I&APs). The aim of the meeting was to capture the initial concerns from the members of the public and key I&APs. During the public meeting which took place between 16h00 and 18h00, a presentation of the project description, preliminary impact assessment, project team and project timeframes was delivered to all attendees of the meeting by Environmental Impact Management Services (EIMS) Pty (Ltd). A presentation was delivered by Mr GP Kriel from EIMS in Afrikaans. SEICHE delivered a presentation on the environmental mitigation carried out during seismic surveys in terms of the Marine Mammal Observer (MMO) and Fishing Liaison Officer (FLO) in Afrikaans. The presentation was delivered by Mr Rudian Baily. After the presentations were delivered, a question and answer session was opened where attendees asked questions or expressed their comments regarding the project. The attendance register has been attached as an appendix to this document.

Item No	Item
1.	Alle deelnemers is versoek om die bywoningsregister te onderteken soos hulle ingestryf het. Aanbiedings van EIMS en SEICHE van die projekbeskrywing, aansoekproses en omgewingsversagtings tydens seismiese opname is gelewer volgens die agenda hierbo aan die vergaderinggangers. Daar is aangedui dat die vergadering opgeneem sou word vir die doeleindes van akkurate notule neem. Agtergrondinligtingsdokumente (in Engels, Afrikaans en isiXhosa), kommentaarvorms, registrasie, inligtingsuitdeelstukke en bywoningsregisters is by die vergadering beskikbaar gestel. Die deelnemers is aangemoedig om hul kommentaar en bekommernisse in te dien deur die kommentaarvorms in te vul wat verskaf word of deur kommentaar in te dien by die projek-e-posadres wat verskaf is. Daar is opgemerk dat alle deelnemers wat hul kontakbesonderhede verskaf het, by verstek geregistreer sal word op die I&AP-databasis wat deur EIMS gehandhaaf word. Na aanleiding van die aanbiedings is die vloer oopgemaak vir 'n bespreking en die deelnemers is aangemoedig om enige vrae of bekommernisse wat hulle oor die projek gehad het, op te stel. *All attendees were requested to sign the attendance register as they entered. Presentations from EIMS and SEICHE of the project description, application process and environmental mitigations during seismic survey were delivered as per the agenda above to the meeting attendees. It was indicated that the meeting would be recorded for the purposes of accurate minute taking. Background Information Documents (in English, Afrikaans and isiXhosa), comments forms, registration, information handouts and attendance registers, were made available at the meeting.* *The attendees were encouraged to submit their comments and concerns through filling in the comment forms provided or by submitting comments to the project email address provided. It was noted that all attendees who have provided their contact details would be registered by default on the I&AP database maintained by EIMS. Following the presentations, the floor was opened for a discussion and the attendees were encouraged to bring up any questions or concerns they had about the project.*
2.	Vraag en Antwoord/ *Questions and Answers*
a.	John Adams Dankie, ek is John Adams, woonagtig hier in Hondeklipbaai. Ek het onder dag by die laaste vergadering het ek gevra watter kop het jy nou weer op, die rede vir dit is, presies wat ons nou, die slide-show wat julle vir ons nou gewys het, wat presies in die vorige keer ook gehou, die feit dat dit nou 'n nuwe konsultant is of 'n projek is, is dit presies dieselfde dinge wat gebeur in die vorige projek en wat nou gebeur. As ek nou kyk na die operasie wat hulle daar uitwys van die loei wat hulle nou daar alstour in die water in, dis presies dieselfde. Die werksaamhede daar op die boot, onse vrees is net, op die vorige keer kon ons nie die antwoord gekry het nie, nou is, gaan ons nog steeds nie die antwoorde kry nie, jy het nou tarlocps gesê, ons moet nou nie die twee met die ander ene vergelyk nie. Waar ek nou is, is ek by die laaste keer se ene. En my vraag wat ek daar gaan het is weereens; hoe kommunikeer hierdie apparate met die visse? En dit is eintlik onse grootste knelpunt. Hoelank gaan ons nog vis vang as hierdie proses aan die gang is? Nou is daar 'n eerste ene, hier is nou weer 'n tweede aansoek, daar is nou daar gekoppel vir toekenning gee vir 'n, of die projek kan voortgaan of nie, op die vorige workshops het ons nog nie terugvoering gekry oor die vorige projekte wat aanduiding gegee het van hierdie selfde operasie, ons in nou nie by daardie ene nie, hier is weer 'n nuwe een op die tafel. So, ongelukkig moet ek, as ek praat van die huidige kan ons nou maar net aan luister wat nou vandag gesê word, maar as ons terugfiits

Item No	Item
	is ons op dieselfde channel van die vorige ding, so ek wil graag net weet, die kommunikasie met die vis. Want dit is onse groot knelpunt, baie dankie. *Thank you, I am John Adams, living here in Hondeklip Bay. I asked the other day at the last meeting what help do you have back up now, the reason for that is, exactly what we are now, the slide show that you guys held for us now was exactly in the last time also held, the fact that it is now a new consultant or a project, it's the exact same things that happened in the previous project and what's happening now. Now, when I look at the operation they're pointing out there from the bottleneck they're sending down there into the water, it's exactly the same. The activities there on the boat, our fear is just, last time we couldn't have gotten the answer, now is, we're still not going to get the answers, you said casually now, we shouldn't compare the two with the other ones now. Where I am now, I'm at the last time's ones. And my question of what I went there is again; How do these gadgets communicate with the fish? And that's actually our biggest bottleneck. How long are we still going to fish if this process is ongoing? Now there is a first one, here is now another second application, there is now linked there for grant giving for a, whether the project can continue or not, on the previous workshops we have not yet received feedback on the previous projects that gave indication of this same operation, we in now not at that one, there's a new one on the table again. So, unfortunately I have to, when I'm talking about the current one we can just listen to what's being said today, but if we have a flashback we're on the same channel of the previous thing, so I'd like to just know, the communication with the fish. Because that's our big bottleneck, thank you very much.* GP Griel In terme van die kommunikasie met die vis, dit is hoekom ons 'n omgewingsimpak studie moet doen. Dit is omdat dit 'n aktiwiteit is wat kan 'n impak hê op die vis. Dit is die sentrale komponente van ons studie, van ons impak studie is om te gaan kyk na die vissery om te gaan kyk na die verskillende tipes vis wat daar voorkom, waar hulle broei, ens. en dan gaan kyk ons na die verskillende dinge van bo tot onder, soveel as moontlik. So daar is 'n groot klomp reeks studies wat gedoen is in die Suid Afrikaanse geskiedenis deur verskillende ouens hier langs die kus af, daar is 'n groot klomp studies wat huidiglik aan die gang is, so ons gebruik al daai inligting van daai ouens af om te kyk. Ons weet daar is waar die spawning areas is, daar is waar die recruitment area, al daai tipe goeters is, en dan weet ons, gebaseer op al daai inligting kan mens dan 'n besluit gaan maak en sê luister die waarskynlikheid van die impak is so groot of dit. Dis dan ook spesifiek hoekom ons gaan kyk het na die akoestiese goeters. So, wat ons doen met die akoestiese goeters, omdat dit 'n harde knal is, moet 'n mens gaan kyk hoe verander daai knal oor tyd en oor afstand en afhangende van die water en wat daar is en die seestrome doen en die weer en al daai goeters en dan kan die ouens dit gaan, hulle het redelike akkurate modelle wat hulle dan kan gebruik om te sê, oukei, luister hierdie tipe knal gaan op hierdie afstand so hard wees en hy gaan dan binne hierdie frekwensie wees, en dan kan jy uit gaan figure, hierdie, ons weet dan op watse frekwensies kan watse diere dit hoor en dan kan 'n mens sien; oukei luister hierdie walvis gaan heel waarskynlik so reageer op daai ding, hierdie tipe walvis gaan so reageer op daai, hierdie tipe vis met sy verskillende pressure bladders en al daai tipe goeters gaan so reageer. So dan gaan kyk mens na al daai verskillende goeters, en dan is daar verskillende threshold shifts wat 'n mens kan kyk en daai threshold shift beteken basies waar hy sy gedrag gaan verander. So dit is soos basies, as jy 'n verskriklike harde luidspreker aanzit, op watter afstand kan jy staan dat jy gaan oukei voel dat jy nie gaan bedreig voel en gaan wegswem en daai tipe goeters nie. So al daai goeters is die goeters waarna die ouens op hierdie stadium nou besig is om te kyk en dis hoekom dit belangrik is om te modelleer en te kyk waar hulle aansoek area is, wat die omstandighede by daai area is en om dit is, watse mense daai area gebruik, watse visse daar voorkom, al daai tipe goeters en dan op die oor einde van die dag, 'n geheelbeeld te kry daarvoor om te sê oukei hierdie is die waarskynlike impak op die vis, hierdie is die waarskynlike impak op daai dier, op daai dier, op daai dier, op daai gedeelte van die

Item No	Item
	ongewing, en so aan en so aan. So dis min of meer die method behind the madness so dis wat ons probeer doen daar. Ek weet nie of dit jou vraag beantwoord nie. *In terms of communicating with the fish, this is why we should conduct an environmental impact study. This is because it is an activity that can have an impact on the fish. These are the central components of our study, from our impact study is to go and look at the fishery to go and look at the different types of fish that are found there, where they breed, etc. And then we go and look at the different things from top to bottom, as much as possible. So there's a big bunch of series of studies that have been done in South African history by different guys down here along the coast, there's a big bunch of studies that are going on right now, so we're using all that information from those guys to watch. We know there's where the spawning areas are, there's where the recruitment area, all those types of things are, and then we know, based on all that information, one can then go and make a decision and say listen the probability of the impact is so great or that. That's specifically why we went to look at the acoustic stuff. So, what we do with the acoustic stuff, because it's a loud bang, one has to go and see how does that bang change over time and over distance and depending on the water and what's there and the ocean currents do and the weather and all those things and then the guys can go in, they have pretty accurate models that they can then use to say, Okay, listen this type of bang is going to be so loud at this distance and he's going to be within this frequency then, and then you can go out figures, this, we know then at what frequencies can what animals hear it and then one can see; okay listen this whale is probably going to react that way to that thing, this type of whale is going to react so much to that, this type of fish with its different pressure bladders and all those types of things are going to react that way. So then you go and look at all those different things, and then there are different threshold shifts that one can watch and that threshold shift basically means where he's going to change his behaviour.* *So it's like basically, if you put on a terribly loud speaker, at what distance can you stand that you're going to feel okay that you're not going to feel cheated and go swimming away and those types of things. So all these things are the things that the guys are looking at right now and that's why it's important to model and see where their application area is, what the conditions are at that area and what it is, what people use that area, what fish are there, what fish are there, all those types of things and then at the end of the day, get a big picture about saying okay this is the likely impact on the fish, this is the likely impact on that animal, on that animal, on that animal, on that part of the environment, and so on and so on. So that's more or less the method behind the madness so that's what we're trying to do there. I don't know if that answers your question.*
b.	**Dawid Strydom** Die ding sneak dit vir my praat nie, hoe dit ook al sy, can you hear me now? Hoe dit ook al sy, dit wat u nou sê, dit klink nou asof dit nou die eerste keer is wat so 'n opname of navorsing stuk gedoen word, want jy sê sorry, laat ek nou nie sê jy, u sê dat ons gaan nou nog gaan kyk hoe die goeters gebeur, ons gaan nou nog loop kyk, asof dit die eerste keer is. Nou kom ek sê ek het nou ook nou 'n bietjie internet klomp navorsing gedoen en ek gaan nou dit u nou wys op hierdie presentation wat julle nou hierso het, stuur ek nou vir u 'n email sodat u sommer hierdie navorsing stuk van dokters en professore wys wat is die effek en dit kan gelees word en dan gaan ons vir ons moal in Afrikaans ook dan verduidelik wat is die effek en wat sê Dr Kosie en wat sê Dr Klasie. Nou as ek praat van dokters en professore wat hierso is, laat ek nie praat nie, dan moet ons nou vra nou; wat is die manse, is julle honneursgrade, doktorsgrade, PhD, whatever grade, om dan die dokters te counter wat hulle sê, nie wat ek sê nie, wat die dokters sê op hulle se navorsing stukke wat is die effek en op die langtermyn en hoe dit gaan gebeur. So, hoe dit ook [al sy? 0:47:07] ons kan nie gaan sê ons moet nou nog gaan kyk wat het gebeur nie, want die goeters het alreeds gebeur. Nou kom ek sê ook nou, ek is ook 'n gegraduseerde van Stellenbosch Universiteit en ek wil nie nou meer hê, ek wil ook net saam met 'n stroom gaan en aan die neus gelei word nie. Kom

	ons verstaan daai reg. Ek het ook my research dokumente gedoen en ek ken daai goeters, nou moet ons nou nie aan die neus laat lyk nie, kom ons vat nou ook 'n ander aspek van 'n ander dokter en 'n ander professor dat ons nie net van julle se tafel af staan en eet nie. Miskien gaan ons nou die email adres nou gou-gou vir u net kom lash, stuur dit dan en sit dit daarop. Ons het gekom, ons het tyd, dit behoort seker nie baie lank te vat om vir ons daai dokter se navorsing stuk te gee nie, sodat ons 'n inligting kry van 'n ander oogpunt dan, nie net van hierdie mense hier nie want hierdie mense hou ons soos donkies op onse dinges met klappe en sê luister wat ons wil hê julle moet sê. Ek wil ook net sê, byvoeg, voor ek nou verder aan daarso aangaan, voor ek hulle nou hierdie ding gaan stuur, ons moet onthou waarvan af ons kom. En onse geskiedenis moet 'n maatstaf wees van hoe ons hier vanaf vorentoe gaan beweeg. Nou waarvan praat ek? Kom ek praat nou van die invasion of South Africa. Toe het die mense oorsee gekom en onse gronde en onse land gekom afvat oraait. Nou hulle is nie meer by die grond en die land nie, hulle vat nou die see ook oor. Nou ons, hoe ver wil ons nou nog gekondisioneer word of onse minds gekoloniseer word in die hoop dat hulle gaan vir ons iets moois bring? Ons sit met 'n dangerous en ons sit met 'n very dangerous situation whereby ons glo wat ons nie moet glo nie. Nou kom ons kry ook nou in die verband nou 'n angle, miskien moet ek ook nou in daai selfde asem ook vra, en ek kan jou nou al sê jy sal nie vir my daai vraag kan beantwoord nie, jy verteenwoordig mos nou hierdie mense, nou ek het 'n bietjie gaan oplees dat die maatskappy was in April in die hof gewees, right? En toe hulle in April in die hof was toe sê hulle, hulle het 'n R 450 000 000.00 reeds gespandeer net om die kontrak te kan kry. Of dit nou net om blasting te kan doen. Nou vra die hof; right, as dit die geval is, wys vir my hoe het julle die R 450 000 000.00 gespandeer? En die hof het dit difficult to the extent tot onmoontlik gevind but toe present hulle in die hof, want hulle het nie bewyse hoe hulle daai R 450 000 000.00 gespandeer het nie. Nou wat het van die R 450 000 000.00 gebeur, of is die mense omgekoop. Maar van julle doen 'n presentation, nou kom ek sê net ek doen nie die presentation nie, die dokters en die professore en die navorsing wat so ver soos 2017 gegaan het, hulle kan vir ons dan 'n beter of 'n geheelbeeld ook maar gee van wat gebeur, miskien is dit nou tyd ook nou dat die mense 'n koekietjie kan eet solank die email deurgestuur word na u toe. Met u toestemming, dankie. *The thing tastes like it doesn't speak to me, either way, can you hear me now? Anyway, what you're saying now, it sounds like now it's the first time such a survey or research piece has been done, because you've saying sorry, now let me not say you, you're saying that we're still going to go and see how the stuff happens, we're still going to watch the stuff now, we're still going to watch, as if it were the first time. Now let me say I've also done a little internet bunch of research and I'm going to point out now that you guys have hereso now, I'm sending you an email now so you just show this research piece from doctors and professors what is the effect and it can be read and then we're going to explain to us nicely in Afrikaans also then what is the effect and what does Dr Koole say and what does Dr Klasie say. Now if I'm talking about doctors and professors who are here, let me not speak, then we must ask now; what are the people, are your honours degrees, doctorates, PhD, whatever degrees, to then counter the doctors what they say, not what I'm saying, what the doctors say on their research pieces what is the effect and in the long run and how it's going to happen. So either way [whatever? 0:47:07] we can't go and say we still have to go and see what happened, because the stuff has already happened. Now let me also say, I am also a graduate of Stellenbosch University and I don't want anymore, I also just want to go with a stream and be led by the nose. Let's understood that right. I've also done my research documents and I know these things, now we shouldn't have the nose suffered, now let's take another aspect of another doctor and another professor that we're not just standing and eating from your table. Maybe now we're going to just come and put in the email address for you soon, then send it and put it on it. We've come, we've got time, it probably shouldn't take very long to give us that doctor's research piece, so we get an information from a different point of view then, not just from these people here because these people are holding us like donkeys on our things with slaps and saying listen to what we want you to say. I also just*

	want to say, add, before I move on to it now, before I'm going to send them this thing now, we have to remember what we're coming from. And our history needs to be a measure of how we're going to move forward here. Now what am I talking about? Now let me talk about the invasion of South Africa. Then the people came overseas and came to take down our lands and our land. Now they are no longer at the ground and the land, they are now taking over the sea as well. *Now we, how far do we still want to be conditioned or our minds colonized in the hope that they are going to bring us something beautiful? We sit with a dangerous situation and we sit with a very dangerous situation whereby we believe what we should not believe. Now let's get an angle now too, maybe I should ask in that same breath too, and I can tell you by now you won't be able to answer that question, you're representing these people now, now I've gone to read up a bit that the company was in court in April, right? And when they were in court in April they said, they had already spent a R 450 000 000.00 just to get the contract. Be it just to be able to do blasting. Now the court asks: right, if that's the case, show me how did you spend the R 450 000 000.00? And the court found that difficult to the extent impossible but then present them in court because they do not have evidence how they spent that R 450 000 000.00. Now what happened to the R 450 000 000.00, or were the people bribed. But some of you are doing a presentation, now let me just say I'm not doing the presentation, the doctors and the professors and the research that went as far as 2017, they can then give us a better or a big picture of what's happening, maybe it's time now that the people can eat a cookie as long as the email is forwarded to you. With your permission, thank you.* **GP Kriel** Ek wil net gou sê ek dink die email is 'n goeie idee, stuur dit asseblief vir ons. Ek wil dit graag sien – ek gaan dit net ongelukkig nie nou kan deurgaan nie. Want ek sal graag net deur dit wil gaan dat ons kan kyk wat die situasie is. Wat ek voorstel en met julle toestemming asseblief, wil ek dit graag voorstel dat ons, kom ons stuur daai epos vir ons, ons gaan dit aanstuur vir ons mense en dan gaan hulle gaan kyk daarna en kan ons gaan kyk of dit navorsing is wat nuut is of nie en dan kan ons dit ook in ag neem in ons verslag. Ek wonder of dit dalk 'n beter manier is om te kyk want op hierdie stadium het ons nog nie, ons is nog in die begin stadium van hierdie proses so ek wil nie, I don't want to jump the gun. Maar ek is baie dankbaar dat jy vir ons dit wil deurstuur. I just want to say, I think the email is a good idea, please send it to us. I'd like to see it – I'm just unfortunately not going to be able to go through it right now. Because I'd love to just go through it that we can see what the situation is. What I'm proposing and with your permission please, I'd like to suggest that we, let's send us that email, we're going to forward it to our people and then they're going to go look at it and we can go see if it's research that's new or not and then we can also take that into account in our report. I wonder if this might be a better way to look because at this point we haven't yet, we're still in the beginning stages of this process so I don't want to, I don't want to jump the gun. But I'm very grateful that you want to send us through this.
4.	**Dawid Markus** Maar nou is julle selektief en julle wil hê ons moet kyk wat julle vir mens wil sê right, so ons moet luister as julle vir ons 'n presentation kom gee right, nou vra ons, wat is die moontlikheid dat julle lieg vir onse mense. Dit behoort vyf minute te vat om daai artikel te kry sodat ons kan sien wat sê die dokters en wat sê die navorsing, wat is die effek op die marine ekosisteem? *But now you're selective and you want us to see what you want to say to you, so we have to listen when you come and give us a presentation, now we're asking, what's the possibility that you're lying to our*

	people. It should take five minutes to get that article so we can see what the doctors say and what does the research say, what is the effect on the marine ecosystem?
	GP Kriel
	Dit 'n langer proses hierdie. Dis nie net 'n vandag nie, so wat dit is, is ons gaan daai vat, ons wil dit gaan kyk na, ons het dit dan gevat en dan die volgende keer wanneer ons terug kom gaan ons met julle kom terugvoering gee oor daai storie. So, kan ons dit onderneem, want vir my om dit nou te doen, om dit hier te kry, ek dink ons gaan tyd mors, ek gaan 'n halwe inligting hê, ek gaan nie konteks hê van al daai goeters nie, ek moet dit ook eers met my mense gaan bespreek wat die spesialiste is op daai area en dan kan ons vir julle kom terugvoering gee oor wat sê hulle van dit, wat is die situasie en ek dink dan kan ons 'n dialoog hê daaroor. Dan ons op die regte manier gesels daaroor. Ek wil dit met jou doen, ek sal nou 'n onderneming maak dat ons dit doen en dan doen ons dit so.
	Ek stem saam met jou, ek wil jou nie, ons wil julle nie stil maak of wat ook al nie, ons het regtig hiernatoe gekom om oop kaarte te kom speel en vir julle 'n voorlegging te kom gee van dit wat ons weet. Ons is nie hier om iets weg te steek nie. Julle weet van die vorige prosesse, ons het aangegaan met al die goeters, ons is nie eers betaal vir daai vorige proses nie en ons het nog steeds vir julle laat weet wat aangegaan het. Ons wil niks wegsteek nie. Die idee is glad nie om iets weg te steek nie. As daar onsekerhede of tekortkominge of wat ook al in ons proses is moet ons volgens wet dit in sit in ons verslae en al daai tipe van goeters. So ons probeer oop kaarte speel so ver soos wat ons gaan. So asseblief, ons wil rêrig niks wegsteek nie. Ons nie hier met 'n agenda of enige iets nie ons is hier om oop kaarte met julle te kom speel ons wil julle net bekend tel en sê oukei luister; ons weet daar is dalk verwarring daar is verskillende goeters wat aangaan, die wêreld is besig om teen 20 000 kilometer 'n uur te koop maar asseblief, hierso is die situasie, dit is wat aangaan. Ons wil regtig nie kom verwarring saai nie, ons wil kom clarity gee. En dan vir julle 'n geleentheid gee om te dialogue, om te gesels, om te praat. So dit is glad nie om goeters te doen nie, asseblief, ons wil regtig met julle oop kaarte kom speel en ek waardeer dit, dit is vir ons van kritiese belang. Want ons weet ons is geleerde ouens in 'n spesifieke veld maar ons weet daar is mense wat hier bly wat ook goeters weet en dit is belangrik dat julle kennis dan in ag geneem word. Dis belangrik dat julle kennis dan ook gedeel word. As ons 'n gap het moet julle dit kom aanvul dan moet julle vir ons kan sê; julle het op gesig daar. So, ek waardeer dit rêrig dat jy dit doen maar ek dink net op hierdie stadium om dit nou hier in hierdie vergadering te gaan doen gaan nie heeltemal lekker werk nie en ons wil terug kom en ons wil daai ding kom bespreek in die volgende keer, is dit reg so?
	It a longer process this. It's not just a today, so what it is is we're going to take that, we want to go check it out, we took it then and then the next time we come back we're going to come and give you feedback on that story. So, can we undertake this because for me to do it now, to get it here, I think we're going to waste time, I'm going to have half an information, I'm not going to have context of all those things, I also have to go and discuss it with my people first what the specialists are in that area and then we can come and give you feedback on what do they say about it, what is the situation and I think then we can have a dialogue about it. Then we chat about it the right way. I want to do it with you, I'll make a company now that we do it and then we do it that way.
	I agree with you, I don't want you, we don't want to silence you or whatever, we really come here to come and play open cards and come and give you a presentation of what we know. We're not here to hide anything. You know about the previous processes, we went on with all the things, we weren't even paid for that previous process and we still let you know what went on. We don't want to hide anything. The idea is not to hide anything at all. If there are any shortcomings or shortcomings or whatever in our process, we have to put them into our reports and all those types of things by law. So we try to play open cards as far as we go. So please, we really don't want to hide anything. We not here with an agenda or anything we're here to come and play open cards with you we just want to count you know and say okay

	listen; We know there may be confusion there are different things going on, the world is buying at 20,000 kilometres an hour but please, here's the situation, that's what's going on. We really don't want to come and sow confusion, we want to come. And then give you an opportunity to dialogue, to chat, to talk. So it's not to do things at all, please, we really want to come and play open cards with you guys and I appreciate that, it's critical for us. Because we know we're learned guys in a particular field but we know there are people who live here who also know things and it's important that your knowledge is taken into account. It is important that your knowledge is shared. If we have a gap you have to come and supplement it then you have to be able to tell us; you guys slipped up there. So, I really appreciate you doing it but I just think at this point going to do it right now here in this meeting isn't going to work quite nicely and we want to come back and we'll come and discuss that thing next time. Is that right?
4.	**Patrick Ralph** Ja, my storie is ook maar dieselfde soos laaste, en ek voel baie sterk daaroor dat hierdie is 'n onding. Want elke gevolg is 'n nagevolg. Nè, en die nagevolge van hierdie ding, olle in water is nie maats nie. Government fail ons in hierdie verband. En daarom kan ek ook nie saamstem met wat julle hier kom verkoop nie, in elk geval nie. Julle se vertroue oop hierdie tegnologie is vir my verbasend. Ek is ook hier, ek sit ook hier en ek vat ook tellies en ek sien ook die vis getalle jaarliks sien ek. En dit lyk nie goed nie. Met al hierdie benamings en goed wat gegee word vir aard verwarming en watse goeters en goed, is dit dieselfde ding, dis dieselfde wat hier gebeur nou bo op hierdie aard verwarming, verstaan om nou nog met hierdie tipe van goed te kom. En ander keer is hier gesê waar na toe draai Hondeklipbaai se inwoners hulle? En ek, in hierdie geval die hele Weskus af, waarnatoe draai ons nadat julle sien hoe verwoes hierdie aarde is hierso. Hier is niks, dis 'n dooie stuk aarde hier af, die enigste lewe is hierdie kant, en die enigste lewe wat maar, onse voorouers het nie hierdie reg gehat wat ons vandag het, hulle is nie gevra nie. Ons, hierdie geslag word vandag, word gevra om toestemming te gee om hierdie see te verwoes. So ons kan nie ja sê nie. Ons kan nie saamstem met hierdie oefening nie. So soos ek sê dis 'n onding vir my en hierdie ding moet verwerp word. In elk geval is dit 'n ding van government verstaan vir klein of vertolk kleinskaalse vissers anders as wat die gemeenskap hom vertolk, hulle het 'n paar mense het hulle gegroepeer en gesê ouke julle word erken as Hondeklipbaai se vissermanne, se vissers, so ons gee julle 'n kwota, 'n kwota vir soveel jaar maar hier is deaglike mense wat kom en ek kan nou maar 'n simpel voorbeeld maak, uit die skool uit kom wat klaar maak met skool waarnatoe gaan hierdie manne wat nie werk het nie. Hulle gaan see toe, verstaan? Maar nou moet hulle, hulle moet oor hulle se skouer kyk en loop visvang. Dis wat hier gebeur, in plaas daarvan dat government meer kwotas toestaan aan onse mense wil hy nou die lewe verwoes. So dis hoekom ons sê ons kan nie ja sê nie. Al hierdie knal gelukie en goed wat julle hier aan gaan, kom ek is simpel, daai diere kan mos doof raak as gevolg van daardie klanke en goeters, hè? Wanneer gewaar julle daai dinge? Soos ek sê hier is manne wat met fish finders loop visvang, dan wys daai ding niks, dan vang die man daar vis. Hulle kom op hier, want dan sê hulle, hulle verstaan nie, daai ding het eiks gewys nie, hy is aan, hy is tegnologies aan, daar wys daar is nie vis nie maar hulle vang daar vis. So, die tegnologie is feilbaar. Die tegnologie wat julle so vertrou is feilbaar. So ons kan nie as 'n community met hierdie ding saamstem nie. Dis my dingesse en goete, my bydrae wat ek lewer. Wie wil nog stemps opsit. *Yes, my story is also just the same as last, and I feel very strongly about this being an "onding". Because every consequence is an afterthought. Huh, and the aftereffects of this thing, all in water are not mates. Government fails us in this regard. And that's why I can't agree with what you guys are coming to sell here either, anyway. You're confident in this technology is surprising to me. I'm here too, I sit here too and I also take tellies and I also see the fish numbers every year I see. And it doesn't look good. With all these designations and stuff that's given for earth warming and what's going on and stuff, it's the same*

Item No	Item
	thing, it's the same that's happening here now on top of this kind of warming, understand to come up with this type of stuff now. And other times it has been said here where do Hondeklip Bay residents turn to? And I, in this case the whole West Coast, what we turn to after you see how devastated this earth is hereso. There's nothing here, it's a dead piece of earth down here, the only life is this side, and the only life that but, our ancestors didn't have this right that we have today, they weren't asked. We, this generation today, are being asked to give permission to devastate this sea. So we can't say yes. *We disagree with this exercise. So as I say it's an ending for me and this thing should be rejected. In any case, it's a thing of government understanding for small or interpreted small-scale fishermen differently than the community plays him, they've got a few people grouping them and saying okay you're recognized as Hondeklip Bay's fishermen, so we're giving you a quota, a quota for so many years but here are people coming on a daily basis and I can just make a silly example, coming out of the school that finishes school these men who don't have a job go to. They're going to the sea, understand? But now they have to, they have to look over their shoulder and walk fishing. That's what's happening here, instead of government granting more quotas to our people, he now wants to ruin life. So that's why we say we can't say yes. All these popping sounds and stuff you're going on here, let me be silly, those animals can go deaf because of those sounds and things, huh? When do you notice those things? As I say here are men who walk fishing with fish finders, then that thing shows nothing, then the guy there catches fish. They come up here because then they say, they don't understand, that thing hasn't shown anything, he's on, he's technologically on, there's no fish but they're catching fish there. So, the technology is fallible. The technology you trust so much is fallible. So we can't agree with this thing as a community. It's my things and things, my contribution that I make. Who still wants to put up votes.* **GP Kriel** **Baie dankie vir daai Mnr Rulfe. Kyk ek meen hierdie is nie om noodwendig te kom toestemming praat en daai tipe goeters nie, maar dis belangrik dat julle julle sê sê. Dis belangrik dat julle moet sê hoe julle as gemeenskap voel want daai is belangrik vir die besluit wat geneem moet word oor hoe die mense voel. So dis hoekom ons hierdie keer gekom het en met ons huidige proses en goeters ook die sosiale kant van dinge probeer kry en met die erfenis en daai goeters probeer doen so want dit help nie daar is miskien 'n kleinerige impak gewees of wat ook al nie maar die gevoel in die gemeenskap is dalk nie so hot oor die hele besigheid nie. So daai en is ook vir ons baie belangrik so ek, baie dankie vir dit, ons sal dit opsit in die notules en goeters. Die tegnologie en goeters wat hulle daar gebruik is nie, ek wil net dit sê, dis nie jou gewone fish finder nie, maar dit, daai is 'n impak, dis hoekom ons die impak studie moet doen, dis hoekom hulle nie net kan gaan doen wat hulle wil doen nie, dit is juis die rede daarvoor en ons moet dit gaan identifiseer.** *Thank you so much for that Mr Rulfe. Look I'm not thinking this is necessarily to come and talk permission and those types of things, but it's important that you have your say. It is important that you say how you feel as a community because that is important for the decision that needs to be made about how the people feel. So that's why we came this time and with our current process and things are also trying to get the social side of things and trying to do with the heritage and those things so because it doesn't help there might have been a smallish impact or whatever but the feeling in the community might not be as hot about the whole business. So that and is also very important to us so I, thank you so much for that, we'll put it up in the minutes and stuff. The technology and stuff they're using there isn't, I just want to say this, it's not your usual fish finder, but this, that's an impact, that's why we need to do the impact study, that's why they can't just go and do what they want to do, that's precisely the reason for it and we have to go and identify it.*

Item No	Item
	Dankie, JP, yes, ek dink op hierdie stadium as 'n konsultant moet jy baie rustig met ons wees, op 'n vorige keer kan ons goed aangespreek het wat ons nog nie antwoorde op gekry het nie. Hierdie is soortgelyk aan dieselfde wat nou hier sal gebeur. En wat ons nou al geleer het en gaan kyk het is dat as ons begin is dit nie 'n fight wat ons opsit nie. So, hanteer vir ons soos wat ons vir julle hanteer. Dis hoekom ek weer gesê het dat die navorsing wat al gedoen is en die huidige proses wat nou lei tot die tweede proses is soortgelyk en dieselfde maar nou wa ons eintlik 'n vraag wat ons met die vorige een gevra het, en dit is nie nou van belang nie, maar dis in lyn wat ons nou wa. So ons het die vorige keer ook gesê dat ons sal moet vir ons 'n regs span moet kry om vir ons te adviseur, jy sien soos wat daar nou gaan kom is daar is reeds navorsing gedoen van 'n gemeenskap lid en dit word nou, volgens my word dit nou bevraagteken. En ons moet na jou luister, jy is nie hier om nou besluite te neem nie, jy moet besluite deel wat jy hoor. Nou net so deel ons nou onse bekwaar wat ons nou sien deel ons nou saam met julle so ons moet vra vir julle ook, hou 'n bietjie geduld nè, dat, ons gaan party kere baie warm voel onder die kraag want as ons nou net moes geluister het dan het ons nou stil gesit soos die vorige keer. En nou sê ons maar die is dieselfde ding, dis net ander mense. So ons sal ook vir hulle 'n geleentheid gee om weer hulle se navorsing te gaan doen en terug te kom na ons as die gemeenskap toe, so ek weet nie, van my kant, my persoonlike mening is dat enige effek op 'n vis is my toekoms, so ek wil my toekoms, wil ek beskerm. Olie en gas is ook deel van my toekoms maar is daar nie ander en ander plekke wat dit ook het as om in die see in te gaan en ander diere te benadeel? Baie dankie. *Thanks, JP, yes, I think at this point as a consultant you have to be very calm with us, at a previous time we may have addressed things that we haven't gotten answers to yet. This is similar to the same that will happen here now. And what we've learned and gone to see is that if we start it's not a fight we put up. So, treat us as we handle for you. That's why I said earlier that the research that's already been done and the current process that now leads to the second process is similar and the same but now we're actually asking a question that we asked with the previous one, and it's not relevant now, but it's in line with what we're asking now. So we also said last time that we're going to have to get ourselves a legal team to advise for us, you see as what's going to come now there's already been research done from a community member and it's now, I think it's being questioned now. And we have to listen to you, you're not here to make decisions right now, you have to share decisions you hear. Now we share our objection that we are now seeing we are now sharing with you so we have to ask for you too, have a little patience huh, that, we are going to feel very hot under the collar some times because if we should have just listened then we were sitting still now like last time.* *And now we're just saying the same thing, it's just other people. So we'll also give them an opportunity to go do their research again and come back to us as the community, so I don't know, for my part, my personal opinion is that any effect on a fish is my future, so I want to protect my future, I want to protect. Oil and gas are also part of my future but aren't there other and other places that also have it than going into the ocean and harming other animals? Thanks a lot.* **GP Kriel** Ja, akkies as ek bietjie warm geraak het daar. So, ek moet jammer sê daarvoor. Ja, so ons wil regtig, ons wil net luister oor die storie maar soos ek gesê het dis 'n meertrappige proses. Yes, if I got a little heated there. So, I have to say sorry about that. Yes, so we really want to, we just want to listen to the story but like I said it's a multi-step process.
f.	**Bernard Cook** My naam is Bernard Cook ek verteenwoordig Long-time Primary Co-operative Handelsbaai, ook die al erkende visserye hier in die plek. Soos ek na die kaart gekyk het ou GP en my sommetjies gemaak het

	op my calculator is meer as 140 nautical miles waar ons nie vis nie. Kyk, vis soos van prawns al kan jy op die skerm sien, ek het al daar langs het ek getrol ek kan enige skerm in 'n wiel lys, maar 'n kreef kan jy nie sien nie, ons skippers lees maar die grondе waar hulle hulle traps sien, gooi. So, dit kan positief wees vir ons wat teen die wal kreef, daai klank golwe kan onse kreef in laat beweeg, dit kan dit uit ook., ons hoop maar van die beste die kreef sal inbeweeg, maar soos ons mense wat nou vlt in jou keel afspring het, ek laslk nogal nie daai nie. Hier is mense wat moet waar ons werk en daai mense word nie gestop nie, man. Soos die kanne hal, sommer 'n hel of 'n inspuiting vir die dorp wees, so ek sou sê julle moet maar aangaan met julle besigheid en kyk hoe ver julle kom maar ek glo nie dit kan 'n effek op onse vis het nie man. Rêrig want dis net, dis meer die area wat julle dit nie doen nie is baie meer as die area na die internasionale water toe so ons, even ons het nie die geld om even daar uit te kom om daar te loop vis nie, ons kan nie soveel fuel bekostig nie. Die verste wat ons maar seker dit doen is tot op 20 myl en dies meer as 140 nautical miles waar dit sal geskied, dis al wat ek wil sê. *My name is Bernard Cook I represent Long-time Primary Co-operative Hondeklip Bay, also the all recognised fisheries here in the place. As I looked at the map old GP and made my sums on my calculator are over 140 nautical miles where we don't fish. Look, fish like from prawn you can see on the screen, I've been scrolling along there I know any screen in a wheel list, but a lobster you can't see, our skippers just read the grounds where they see their steps. So, it can be positive for us lobstering up the embankment, that sound waves can make our lobsters move in, it can make it out too, we just hope some of the best the lobster will move in, but as we have people who want to jump down your throat now, I kinda don't like that. Here are people who mess up where we work and those people aren't stopped, man. Like the jugs of hell, just be a hell or an injection for the town, so I'd say you guys should just get on with your business and see how far you get but I don't believe it can have an effect on our fish man. Because it's just, it's more the area you don't do is a lot more than the area to the international water so we, even we don't have the money to even get out there to walk there, we can't afford that much fuel. The furthest we do is go up to 20 miles and the like over 140 nautical miles where it will happen, that's all I want to say.* **GP Kriel** Ja, dis 120 kilometer, ja. Dankie vir daai, ek dink dis nog steeds belangrik dat ons kyk jy weet dat ons net seker maak dat ons nie iets verkeerd doen daar of wat ook al nie jy weet so ek dink dis belangrik dat ons, maar dankie vir daai. *Yes, it's 120 kilometers, yes. Thanks for that, I think it's still important that we look you know that we're just making sure we're not doing something wrong there or whatever you know so I think it's important that we, but thanks for that.*
6.	**Patrick Gulpin** Deursy, opinions sal daar wees en ons sal verskil oor 'n sekere ding, nou voordele, voordele van hierdie community moenie uit die oseaan uit kom nie, of nie net uit die oseaan uit kom vir hierdie community nie, dis die goewerment se dingesse daarom is daar munisipaliteite wat in hierdie gemeenskap moet werk om dit so te doen en die aandag word altyd afgetrek verstaan, dit het nie môre 'n effek nie, daai, ons spul en daar kan die goed kan gebeur, dit het al gebeur, nou waarmatoe gaan daai olie? Soos daai vorige spreker gesê het, daai kom wal toe, dan is al die lewe in die near shore tot niet oor 'n paar jaar, nie nou nie. Nou as ek praat oor voordele moet ek nie in my leeftyd voordele wil hê nie, en ek dink nie en ek praat nie oor my nageslagte nie, geld moenie as 'n voordeel gesien word nie. Want dis in ek geval hoe dit hier gebeur, spesifiek in Hondeklipbaai, al hierdie goed wat ons nou hier praat sal government in ek geval seker doen wat hy wil doen, maar ons het gekeer, ons het nie saamgestem nie. Nou wanneer dit dan kom dat government wel inkom en kom maak wat hy wil en die voordele, en nou praat ek daar

Item No	Item
	in terme van kontrakte en werke en you name it, waluitkom, sal ons wildeekween, maar dit is wat hierdie mense, hierdie stadsvaders van Hondekliphaai vir ons probeer verhoed. Hulle doen als wat nie in die boek is, om dit reg te kry. So, wat ek sê is dat die effekte, die effek van wat hier sal gebeur is enorm en dit sal miskien nie in my tyd wees nie maar ek sal my nie laat my nageslag my verwyt laat ek gesê het je vir hierdie ding nie. *That ostie, we'll be there and we'll disagree on a certain thing, now benefits, benefits of this community shouldn't come out of the ocean, or not just come out of the ocean for this community, it's the government's stuff that's why there are municipalities that have to work in this community to do it that way and the attention is always distracted. It doesn't have an effect tomorrow, that, we stuff and there the stuff can happen, it's already happened, now what is that all going to? As that previous speaker said, that come to shore, then all life in the near shore is null and void in a few years, not now. Now when I talk about benefits I shouldn't want benefits in my lifetime, and I don't think and I don't talk about my offspring, money shouldn't be seen as a benefit. Because that's how it happens here anyway, specifically in Hondeklip Bay, all this stuff we're talking about here right now will probably do what he wants to do anyway, but we stopped, we didn't agree. Now when it comes down to government coming in and coming to make what it wants and the benefits, and now I'm talking there in terms of contracts and works and you name it, well come out, we'll want to participate, but that's what these people, these city fathers of Hondeklip Bay are trying to prevent for us. They do everything that's not in the book to get it right. So what I'm saying is that the effects, the effect of what will happen here is enormous and it may not be in my time but I won't let my offspring reproach me let me say yes to this thing.* **GP Hotel** Dankie vir daai kommentaar, ja dit is belangrik, dit is belangrik dat mens na die ding kyk op 'n langer termyn ook. Hierdie proses is net vir die exploration, ek weet, ek weet dat julle weet dat dit eventueel dalk by eksplorasie gaan uitkom en dan by produksie, so die oil spills en daai goeters is 'n moontlikheid in die toekoms, sou hulle daarby uitkom. Maar op hierdie stadium gaan hulle nie goedkeuring kry om eers te drill nie so daar behoort nie olie in die water te wees na die goedkeuring van hierdie ding nie. In die toekoms, sou hulle dalk 'n reserwe kry, vir seker dan gaan hulle kom eksploreer, as die prys reg is, as die toestande reg is, as die wêreld even nog olie soek op daai stadium, verstaan so dan al daai goeters gaan bepaal of dit dan weer 'n opsie gaan wees. En as hulle dan drill, verseker dan moet hulle weer deur daai EIA proses gaan om seker te maak dat daar 'n check and a balance is om seker te maak dat daar nie olie spills is nie of dat jy die kans so ver as moontlik verminder deur sekere dinge in plek te hê. So die oil spills en daai goeters is 'n baie groot issue, dit kan 'n verreikende effek hê, dit kan tot honderde kilometers partykeer verder, as die dinge reg is so dit is 'n baie belangrike ding om na te kyk so wat hulle dan gewoonlik doen is hulle doen 'n oil spill model so hulle weet waar die see currents loop, hulle weet min of meer as jy so groot oil spill het vir so lank en dis op daai plek dan weet hulle min of meer waar dit gaan wees en wat die effek daarvan gaan wees en dan kan jy begin kyk of daai 'n fatal flaw gaan wees en of dit 'n issue gaan wees en daai goeters, so daar is darem 'n check in plek daarso om te sê jy kan nie net gaan doen wat jy wil nie, as jy nou olie en goeters gaan kry kan jy dit nie net produce en uithaal nie, so daar is nog baie fases wat moet kom, so voor, sou hierdie ene goedkeuring kry en hy gaan dan aan, dan is dit net om te kyk wat hulle dink onder die bodem is of daar 'n gesteente is wat dalk olie kan trap en kan hou en dan net omdat daai gesteentes en goeters daar is beteken nie dat daar genoeg olie of dat daar selfs olie in daai ding is nie, hulle moet nog eers gaan boor en gaan kyk. So dis byvoorbeeld wat daai ander ouens nou hier kom doen. So hulle gaan nou kyk wat is daar, as daar 'n groot reserwe is daar nie, kan hulle dit gebruik en so aan. En voor alkeen, en dan as hulle dan besluit hulle wil die produce, hulle wil, daar is iets lewensvatbaar, daar is energie wat hulle kan gebruik en dit is, jy weet hulle moet dit uithaal, dan moet hulle deur nog 'n EIA proses gaan en daai EIA proses laat hierdie ene soos 'n vullatjie lyk. Dis redelik dik, dis redelik moeilik en daar is baie ander goeters, dan begin die

Item No	Item
	goeters soos die social en labour plans, dan begin al daai werkskepping goeters, dan begin al daai goeters 'n konkrete rol speel en dan begin dit baie belangrik raak om te kyk wat is die direkte impak op daai ouens en hoe gaan die, is daar werkskepping, hoe gaan die werkskepping lyk, watse fondse gaan beskikbaar wees, al daai tipe goeters. En dan moet mens krities, dan moet 'n mens weeslik krities daarna kyk so ja, dis baie belangrik dan. So, ja die oil spills kan 'n groot effek hê. In terme van die ouens wat hierso op hulle eie goeters wil staatmaak, ja... dis jammer, ons het die ouens uitgenooi om te kom deel, om hulle sê te kom sê en om te kom insit en hulle gedeeltes ook te sê en goeters maar ja, ons verstaan dat daar 'n dinamiek is in 'n dorp, ons verstaan dat die mense nie altyd saam stem binne in die dorp nie, maar ons wil nie te veel kom inmeng met daai dinamiek nie, ons wil weet van hom, ons wil seker maak dat hy aangespreek word in ons studies en goeters maar ons wil net vir julle die gelaentheid kom gee om kommentaar te lewer hierop sodat julle kan deel hê daarin. *Thanks for those comments, yes it's important, it's important that one looks at the thing in a longer term as well. This process is just for the exploration, I know, I know that you know, it's probably going to come to exploration and then to production, so the oil spills and those things are a possibility in the future, should they get to that. But at this point, they're not going to get approval to drool first so there shouldn't be oil in the water after the approval of this thing. In the future, maybe they're going to get a reserve, for sure then they're going to come and expound, if the price is right, if the conditions are right, if the world is still looking for oil at that point, so understand that all those things are going to determine if it's going to be an option again. And if they drool then, then they have to go through that EIA process again to make sure that there's a check and a balance to make sure that there isn't oil or that you reduce the chance as far as possible by having certain things in place. So the oil spills and those things are a really big deal, it can have a far-reaching effect, it can go up to hundreds of miles away, if the things are right so it's a really important thing to look at so what they usually do is they do an oil spill model so they know where the ocean currents run, they more or less know if you've had that big oil spindle for so long and it's in that place then they more or less know where it's going to be and what the effect of it is going to be and then you can start to see if it's going to be a fatal flaw and if it's going to be an issue and those things. So at least there's a check in place to say you can't just go do whatever you want, if you're going to get oil and stuff now you can't just produce it and take it out, so there's still a lot of stages to come, so before, this one would get approval and he then moves on. Then it's just to see what they think is under the bottom if there's a rock that might be able to tread oil and hold it and then just because those rocks and things are there doesn't mean there's enough oil or that there's even oil in that thing, they still have to go drill and check. So that's what those other guys are coming here to do, for example. So they're now going to see what's there, if there's a huge reserve there, they can use it and so on. And before everybody, and then if they then decide they want it, they want to, there's something viable, there's energy that they can use and it's, you know they have to take it out, then they have to go through another EIA process and that EIA process makes these ones look like a filly. It's pretty thick, it's pretty hard and there's a lot of other stuff, then the things like the social and labour plans, then all those job creations start, then all those things start to play a concrete role and then it starts to become really important to see what's the direct impact on those guys and how do the, is there job creation, what is the job creation going to look like, what funds are going to be available, all those types of things. And then one has to look at it critically, then one has to look at it terribly critically so yes, that's very important then. So, yes the oil spills can have a great effect. In terms of the guys who want to rely on their own stuff here, yes... it's a shame, we invited the guys to come and share, to come and have their say and to come and put their pairs as well and yet, we understand that there is a dynamic in a village, we understand that the people don't always agree inside the village. But we don't want to come and interfere too much with that dynamic, we want to know

Item No	Item
	about him, we want to make sure that he's addressed in our studies and stuff but we just want to give you guys the opportunity to comment on this so you can have a part to it.
h.	**Unidentified lady** Dankie vir die geleentheid, dis nou my derde keer wat ek hier in die vergadering is want ek wil weet wat aangaan. En baie dinge wat ek hoor is by mense wat nie eens vergadering toe kom nie. Dan hoor ek nou wat sê hulle van buitekant af, maar dit is nie wat in die vergadering gesê word nie. Ek wil nie afskiet nie, dis nie my doel nie, maar ek wil ook maar insae lewer van my kant af as 'n vrou en 'n Ma. Destyds het De Beers hier gemyn met al hierdie selfde beloftes hoe hy die dorp vorentoe gaan vat en ander dorpe, en hy het gemyn en gemyn en gemyn en ek was een van die bevoorregtes wat daar gewerk het by De Beers en op die einde van die dag toe hy nie meer kos nym en niks uitkry nie, soos die vorige spreker gesê het, is hier nou dor en droog. Die vuur wat daai jare terug gegaan het, wat daai jare daar was kan nou nie meer terug gaan nie want dis omgedolwe. En nog 'n vorige spreker het ook gesê daar is so baie wat nou hier teen die kus langs gebeur, mense wat nou nog besig is om onse areas om te delwe en vir die see ook 'n gevaar is en ek wil my bekommernis uitspreek en ek sal graag wil nog deel wees om die ding te kan verstaan om, dat ons mekaar kan verstoom en meer met mekaar kan engage want 'n ingeligte persoon kan ingeligte besluite maak. Maar as ons oningelig is dan kan ons nie deel, so vir my persoonlik voel ek een keer in 'n maand is te min, want September maand maak julle dit, November maand maak julle dit, en ek voel ek persoonlik is nog nie op die level om 'n besluit te kan neem of om toestemming te kan gee nie. Maar as ek kyk aan De Beers se jare wat hulle gekom doen het en die Oppenheimers is weg en ons sit vandag, my kinders sit vandag sonder werk. Ons kan nie terug daarnatoe gaan nie. Is my vrese ook, gaan dit in die see, gaan dit hierdie kant ook so wees? Gaan dit vir 'n tyd goed gaan en goed gaan en goed gaan en skielik sê die Oppenheimers of die maatskappye; ons is nou klaar ons gaan nou weg, dan sit Hondeklipbaai. Dit is my bekommernis. Dankie. **GP Kriel** Ja, ongelukkig dit is 'n feit, ons weet in die verlede was daar 'n klomp dinge wat gebeur het hier wat nie reg was nie nè, en ons kan ons sien as ons nog hierdeur ry, die letsels daarvan is hiersо en die geskiedenis daarvan is hiersо. En dit het ongelukkig 'n baie groot rol gespeel hiersо in die area en baie mense seergemaak en baie lewens verwoes en daai tipe goeters so ons verstaan daai. Ons het dit nie self beleef dalk nie maar ons hoor dit van julle af en ons kan dit sien as mens hier inkom en goeters en dis hoekom ons die sosiale owens ook gekry het ons dit bietjie te kons ontleed en te kan kyk hoe julle die projek ervaar, hoe julle dit sien en al daai tipe goeters en wat die omgewing is hier binne waar binne die mense leef en operate en so aan. So, dis vir ons baie belangrik om daai in ag te neem en goeters ook. Die, van hoe die owens in die verlede gewerk het en hoe hulle nou moet werk, daar is darem 'n paar dinge wat verander het. Dis nog nie perfek seker nie, maar daar is darem 'n bietjie dinge wat julle as 'n gemeenskap en as 'n groter Suid Afrika bietjie meer beskerm, so hulle kan eindlik nie net meer kom doen wat hulle wil nie, partykeer as hulle dit doen is daar dan 'n recourse, hulle moet dan, hulle kan dan aangespreek word, hulle kan beboet word, hulle kan hulle lisensies verloor al daai tipe goeters, daar is darem 'n wetlike meganisme om dit te probeer aanspreek. En soos wat ons nou gesien het die week wat in Suid Afrika gebeur het as mens nie gelukkig is nie kan jy jouself tot die hof wend en dit ook doen. So, ek is bly ons bly ten minste nog in 'n land waar jy dit kan doen jy weet waar jy nie heeltemal in geboks word en dat jy nie daar regtig het en daai tipe goeters kan doen nie so daai is baie belangrik. Ek stem saam met jou dat ons 'n ingeligte besluit moet maak. So dis hoekom ons graag nie net hiernatoe wil kom en dan net ons verslag skryf en dan gaan ons weg weer nie. Ongelukkig wat die verslag en daai tipe van goeters vat 'n bietjie tyd so ons wil nou kom, vir julle sê ons is besig met iets, hier is wat ons sover weet van hierdie storie, ons prentjie is nog nie heeltemal klaar van hom nie, maar sodra ons 'n draft prentjie van hom het, sodra ons 'n draft idee van dit het wil ons daai idee met julle kom deel en dan vir julle kom sê; oukei, dis

Item No	Item
	wat ons gekry het. So dis hoekom ons probeer, ons wil die verslag wil ons 'n paar weke voor die tyd vir julle beskikbaar stel, hy gaan hier op die dorp wees, hy sal op ons website wees, ons sal, ons is besig om te kyk na 'n data free model, so met ander woorde as jy die ding aflaai van ons webtuiste af, dan betaal dit, dan gaan dit nie jou data gebruik nie, dit gaan ons data gebruik en daai tipe goeters. So, ons wil al daai tipe goeters toeganklik maak vir almal, en dan gaan ons ook soos 'n non-technical summary bysit by daai ding, so daar is partykeer verskriklike hoë wetenskaplike terme, ek dink daai is nie die regte manier om dit noodwendig te doen nie, dat ons dit meer 'n bietjie minder tegnies maak maar dat ons ten minste steeds die akkurate informasie oorbring dat 'n mens daai goeters kan doen. En dan wil ons terug kom en dan weer in 'n platform soos hierdie, wil ons dit dalk met julle kom bespreek. Sal julle miskien meer van 'n langer tipe sessie hou dat 'n mens dalk 'n paar dokumente het dat jy soos 'n werkswinkel of iets soos dit kan doen? Dan kan, ek weet ons het terug gekom met die ander ene en ons het 'n werkswinkel gedoen oor die vorige EIA, sal so iets miskien 'n ding wees wat ons kan kyk na? Sal julle gelukkig wees met so iets? Dan kan ons miskien 'n paar tafels uitsit, 'n paar dinge uitsit en dan kan ons dit 'n uur of twee ekstra spandeer aan die storie en dan kan ons deur Mnr Marius se navorsing gaan, dan kan ons kyk wat ons gekry het, wat hy gekry het, dan kan ons dit in daai forum, sal dit miskien werk? Is dit, is jy gelukkig met so iets.
I.	**Dawid Marius** Die vissers aan taal. Nou as 'n visser dink ek dis belangrik wanneer ons is krieket en whatever game ook speel dat jy jou wickets moet voor keer. Nou as ek praat ek van hou wickets dan beteken dit die vissermanne is nie veronderstel om met twee tonge te praat nie, right? Jy kan nie jou brood altkant wil gebotter hê nie. Maar dit is nou maar die geval, dit werk mos nou maar so. Toe ek in Johannesburg ry, staan daar 'n groot bord daar bo; choose your lane, kies jou baan nou, anderster gaan jy verdwaal. Nou wanneer wil ons onse bane beginne kies? Choose your lane. Want as jy nie die regte pad vat nie en jy vat enige afdraaipad dan gaan jy by 'n plek uitkom waar jy nie wil wees nie. En as die mense, dis die begin om die proses vorentoe te vat, en dis die seismiese opnames. Kom daar 'n fout is jou lifelines afgesny. Kom daar 'n fout Oom Klein en daar kom nou net 'n oil spill, een spill, julle sal nien China sê luister hier ons soek nie hierdie bamboes nie. Die uitsluitlike rede hoekom hulle bamboes byvoorbeeld hierso soek is omdat daai bamboes wat hulle daai kant is, is nie aanvaarbaar nie want dis ge-contamineate. Right, so moenie, jy sien die ding is, as ons nie ingelig is nie, dan is jou besluitneming gevaarlik en dis 'n gevaarlike wapen wat jy het en jy kan jouself vernietig, wa vir my wat 'n soldaat is, as jy nie weet hoe jy 'n handgranaat gebruik nie, iemand vat die handgranaat en gooi die pen doerie kant toe en die granaat gooi hy hierdie kant hang-gelt, God gelukkig het Geldenhuis geduik en daai is nie ek gewees wat geduik het nie anderster het ek nou weer so gesê, en die handgranaat daai kant toe gegooi. So moenie gevaarlike games wil kom steun en speel mense, en dat geld ons nie divide nie. Laat geld ons nie divide nie want ons sien daar is partykeer nou geleenthede en opportunity, kêrels net-nou gaan ek darem 'n kontrak kry. Net as daai olie geloop spil het sal ons besef daai geld kan ons nie meer nie, daar hardloop daai mense in elk geval ook weg. En ek wil dit vir laas onderstreep, government het nie die kapasiteit om enigsins op grond sy eie planne te kan voor rekenskap gee nie hetsy of dit PRASA is, hetsy of dit ESKOM is, whatever entiteit wat dit ook is, wat sal hy nog soe toe gaan? Ek meen in hierdie inligting hulle is 'n papier span, with all due respect, so ons kan nie eers vir government vertrou, kêrels julle weet mos waarvan ek praat. Ons kan mos nie eens government vertrou en nie net dit nie, as ons praat van die marine lewe wat nou daarso gaan plaasvind met hierdie seismiese blasting right, nou hier word gekonsentreer op soogdiere en dis die soogdiere wat ons kan sien right, nou daar is visse wat diep, diep onder die see is en die marine bioloog wat daarso is, wat ons nie kan sien nie, en ons kan nie so diep afgaan om te kan sien om dan daar 120 kilometers down the line, want hierdie navorsing soos die meneer nou daar sê, hy hardloop hiervan af en hy hardloop byvoorbeeld vyf kilometer binne die radius, maar

Item No	Item
	daai seismiese bomme wat hulle daar in die water ingooi right, daai het vierkante kilometers want die verskil is wanneer daai plof in die water inkom nè, dan het hy 'n groter effek en hy's 'n groter radius wat hy dek right maar as dit gaan kom en hy, in die lug in, dan het hy niks effek nie, net wanneer hy in die water is en dit gaan katastrofiese gevolge vir die dinges maak met die blasting. Let me rest my case, maar wat ek wil sê is, kies jou baan, moenie twee rye spore stap nie, en dis gevaarlik, ek het 'n lisensie, dis gevaarlik om in die middel van die pad te ry, moenie op die wit lyn loop ry nie, dis nie jou lyn nie.
	The fishermen one language. Now as a fisherman, I think it's important when we play in cricket and whatever game too that you have to stop your wickets up front. Now if I'm talking about lines wickets then that means the fishermen aren't supposed to talk with two tongues, right? You can't want your bread buttered all the way. But that's just the case, it just works that way. When I was driving in Johannesburg, there was a big sign up there; choose your lane, choose your lane now, otherwise you're going to get lost. Now when do we want to start choosing our lanes? Choose your lane. Because if you don't take the right path and you take any turnoff then you're going to get to a place where you don't want to be. And as the people, that's the beginning of taking the process forward, and that's the seismic surveys. Come on, an error is your lifelines cut off. Come there a mistake Uncle Klein and there's just an oil spill coming, one spindle, you'll see China says listen here we're not looking for this bamboo. The sole reason why they are looking for bamboo, for example, is because that bamboo they are that side is not acceptable because it is contaminate. Right, so don't, you see the thing is, if we're not informed, then your decision-making is dangerous and it's a dangerous weapon you had and you can destroy yourself, ask me what a soldier is, if you don't know how you use a hand grenade, someone takes the hand grenade and throws the pen doerie to the side and the grenade he throws this side bang-gelt, God thankfully Geldenhuis dived and that's not me who dived, so I said so again, throwing the hand grenade that way.
	So don't want dangerous games to come and stand and play people, and that money doesn't divide us. Let's not divide us because we see there are sometimes opportunities and opportunity now, boyfriends just-now I'm going to get a contract. Only if that all has run its course will we realise that money we can't anymore, there are those people running away anyway. And I want to underline that for last, government doesn't have the capacity to be able to account for its own plans at all, whether it's PRASA, whether it's ESKOM, whoever entity it is, what else will it go to sea? I think in this information they're a paper team, with all due respect, so we can't even trust government, you know what I'm talking about. We can't even trust government and not only that, if we're talking about the marine life that's going to take place there now with this seismic blasting right, now here is concentrated on mammals and it's the mammals we can see, now there are fish that are deep, deep under the sea and the marine biologist that's there, which we cannot see, and we cannot go down so deep as to be able to see then there 220 miles down the line, because this research as the Sir says there now, he runs off of this and he runs, for example, five miles within the radius, but those seismic bombs that they throw into the water there. That has square kilometres because the difference is when that explosive comes into the water heh, then he has a bigger effect and he's a bigger radius that he covers but if it's going to come and he, into the air, then he doesn't have any effect, just when he's in the water and it's going to make catastrophic consequences for the things with the blasting. Let me rest my case, but what I want to say is, pick your lane, don't walk two rows of tracks, and it's dangerous, I have a license, it's dangerous to drive in the middle of the road, don't walk on the white line, it's not your line.
	GP Kriel
	Ja, ons is baie bewus van die feit dat daai klank nie net in daai klein area beweeg nie. So ons gaan definitief kyk daarna. dis hoekom ons al daai studies gaan doen, ons gaan probeer kyk so besmoontlik om daai goeters te probeer aanspreek. Ja in terme van die government en goeters; ja ek weet dit is partykeer 'n moeilike situasie maar dis hoekom ek gesê as die government nie hulle werk gedoen het nie soos wat ons geslen het so paar dae terug, dan is daar darem nog iets anders wat mens daaromtrent kan

	doen. So die civil society het nog 'n rol om te speel in die hele besigheid. So dit is belangrik dat ons as mensdom daai ouens in check hou, dat ons hulle op hulle tone hou en seker maak dat hulle die regte goeters doen. Ja ek dink, in terme van die contamination en daai tipe goeters, daai, die klankgolf is nie 'n boom wat hulle afgooi nie. Dis net 'n ding wat 'n groot borrel maak soos compressed air implosion wat hy doen so daar is nie 'n contamination wat hy in die water dan afsit en goeters nie so dis, maar dit is 'n harde knal, dis reg en dit kan 'n effek hê, so dis belangrik om daarna te kyk, en die klankgolwe, wat ons nou al weet, hy trek so bietjie anders op 'n ander frekwensie in die water as wat hy bo in die lug travel so dis hoekom dit belangrik is om te gaan kyk wat die water is, hoe die water is en dat daai ouens met die verskriklike dik brille en die wit jasses dan gaan kyk na daai tipe goeters. So dis hoekom ons hulle aangestel het om te kyk na dit. *Yes, we are very aware of the fact that that sound doesn't just move in that small area. So we're definitely going to look at it, that's why we're going to do all those studies, we're going to try to look at trying to address these things. Yes in terms of government and go-getters; Yes I know it's a difficult situation sometimes but that's why I said if the government didn't do their job like we saw about a few days back, then at least there's still something else you can do about it. So civil society has another role to play in the whole business. So it's important that we as humanity keep those guys in check, that we keep them on their toes and make sure they're doing the right things. yes I think, in terms of those types of things, the sound wave isn't a bomb throwing them off. It's just a thing that makes a big bubble like compressed air implosion that he does so there's not a thing he puts down in the water then and stuff like that, but it's a loud bang, that's right and it can have an effect, so it's important to look at it, and the sound waves, What we know by now, he pulls on a different frequency in the water than he does at the top of the sky so that's why it's important to go and see what the water is, what the water is like and that those guys with those awfully thick glasses and the white coats are then going to look at those types of things. So that's why we hired them to look at it.*
J.	**Ilse Aucamp** Mevrou my vraag is vir u, ek wil net graag weet wat het u nodig om 'n ingeligte besluit te neem, ek dink GP het so bietjie daaraan geraak maar vanuit julle perspektief, hoe...hoe moet ons die inligting bekend stel, wat is dit, het u dalk enige voorstelle van hoe ons dit beter kan doen? Dankie. *Madame my question is for you, I would just like to know what do you need to make an informed decision, I think GP touched on it a little bit but from your perspective, how.. how should we introduce the information, what is it, do you perhaps have any suggestions of how we can do it better? Thank you.* **Unidentified Lady** Ek sal, van my kant af, ek praat vir myself nè, as dinge kan gebeur dat ek kan verstaan dat daar meer werkswinkels dan of meer inligtingsessies gehou raak want soos ek sê dis nou die derde keer wat ek hier is en ek begin, ek sê nie ek stem saam met wat met gedoen raak nie maar ek beginne verstaan en dis hoekom ek sê as dit meer inligtingsessies of meer gekommunikeer raak op phones of waar ook al dan kan 'n mens meer 'n ingeligte besluit, want dan is jy meer bewus want daar is baie goed wat daar buite lê, rumours wat jy hoor van mense wat glad nie vergadering toe kom nie sê ek weer, so dit is wat ek voorstel ook, of dit gebeur of nie gebeur nie want dit klink vir my dit sal gebeur of ons nou toestemming gee of nie. Maar dat hoe meer sessies 'n mens, hoe meer sessies ek kan kry kan ek 'n ingeligte besluit maak. Maar vir my is baie dinge nog baie vaag en soos ek sê ek sit met daai vrees dat wanneer dit gewerk raak aan die ander kant of in die see gewerk raak op die einde van die dag as dit gesplit raak, alle kom terug na die land toe dan is, dit is my vrees want hier is 'n groot voorbeeld. onse mense het nie meer werk nie, De Beers het net opgrapak, net gesê ons gee julle pakkette. Dit was in 'n maand se tyd, want die grond is daar. Dit is my vrees wat ek rêrig mee sit. Meer werkswinkels en goed.

Item No	Item
	I will, for my part, I speak for myself huh, if things can happen that I can understand that there are more workshops then or more briefings being held because as I say it's now the third time I've been here and I'm starting, I'm not saying I agree with what's being done but I'm starting to understand and that's why I say if it gets more briefings or more communicated on or wherever or wherever one can make more of an informed decision, because then you're more aware because there's a lot of stuff lying out there, rumours you hear from people who don't come to the meeting at all I say again, so that's what I'm suggesting as well, whether it happens or doesn't happen because it sounds to me it will happen whether we give permission or not. But that the more sessions one has, the more sessions I can get I can make an informed decision. But for me a lot of things are still very vague and as I say I'm sitting with that fear that when it gets worked on the other side or worked in the ocean at the end of the day when it gets split, all comes back to the land then is, that's my fear because here's a big example, our people don't have jobs anymore, De Beers just packed up, just said we give you packages, it was in a month's time, because the ground is finished. It's my fear that I'm really stuck with. Mhonor workshops and stuff.
k.	**Nicolaas Cloete** Ek is Nikolaas Cloete, Onder Voorsitter hier by die Longtime hier te Hondeklipbaai, ek wil net graag weet, ek kom mos nou al 'n tydjie aan met hierdie sessies en die vrae is alreeds al voorheen gevra, daar sal sekerlik glo ek van stellig daar sal hierdie gemeenskappe nie soveel vrae gevra het nie, die maatskappy kom nou al lank aan met hierdie prosesse wat hy wil hierso doen. En die verskillende rolspelers tot by die gemeenskap, hoekom was hulle nie in die eerste plek erken nie? Daar was, glo ek van stellig, dan sou hier nie soveel vrae uit ontstaan het nie as een van Hondeklipbaai se kinders of hetsy hier teen die Wes Kaap af of teen die Wes Kaap hier op, op die betrokke trippe saam gegaan het of iets van die aard sodat hulle kan nou vandag uit een mond uit gesê het; nou is dit net 'n maatskappy, ons sien nie environmental, ons sien nie ander, verskillende rolspelers wat rondom daai tafel vir ons nou die vrae wat hier gevra word moes nou vir ons kon gesê het nee maar ons het darem saam met die Spanjaarde dit gedoen, die navorsing is gedoen, dit kan ons vir julle dit so sê, dit is wat ons vir julle kan sê; nee maar ons kan nou miskien in die voor nabye toekoms in verseker, dit sal nie geskied of so nie want die bekommerde vrae hierso moes hulle nou kon geantwoord het want ek meen dan sou hulle seker baie werk van julle stowers afgehaal het en saam met die gemeenskappe saamgewerk het maar dit is, dit is seker maar die bron van kommer. Dit is die bron van kommer want ek meen op die ding is mos nou nog eers 'n navorsing ding, dis mos eers 'n ondersoek ding voordat daar geboor word, boor prosesse geloods word so dit is mos nou die ding, van die begin af, daai verskillende rolspelers, wie almal het saam met julle saam die paadjie geloop, die gemeenskappe is mos nie erken nie. So dit is maar die bron van kommer. En ek meen dit sal 'n mens maar seker ook dit ook verstaan dat dit sal so gebeur. Kyk soos hierdie wou nou gesê het, De Beers het my ook darem deur daai prosesse so ek weet van die prosesse, verstaan jy en dit is die bron van kommer, mense kom altyd en hulle kom ontgin en hulle vat die rykdom weg en op die end van die dag is dit soos dit is. So verstaan ook maar die gemeenskappe rondom hierdie oil. *I'm Nicholas Cloete, Under Chairman here at the Longtime here at Hondeklip Bay, I just want to know, I've been coming up with these sessions for a while now and the questions have been asked before, I will surely believe that there these communities won't have asked so many questions, the company has been coming up with these processes for a long time now. And the different role players all the way to the community, why weren't they recognised in the first place? There were, I believe, not so many questions would have arisen here if one of Hondeklip Bay's children, or whether here against the Western Cape or up the Western Cape here, had gone along on the trippe in question, or something of the sort so that they*

	might have said out of one mouth today; now it's just a company, we don't see, we don't see other, different players around that table for us now the questions that are being asked here should have told us now no but at least we did it with the Spaniards, the research has been done, we can tell you so, this is what we can tell you; No but we can now perhaps ensure in the near future, it won't happen or so because the worried questions here they should have answered now because I think then they probably would have taken a lot of work off your shoulders and worked with the communities but that's, that's for sure but the concern.
	That's the concern because I think the thing is still a research thing, it's an investigation thing before drilling, drilling processes are launched so that's the thing, from the beginning, those different players, who all walked the aisle with you, The communities were not recognised. So that's just the concern. And I think it will also be understood that it will happen.
	Look like this woman said now, De Beers has me through those processes too so I know about the processes, you understand and that's the source of concern, people always come and they come and exploit and they take away the wealth and at the end of the day that's the way it is. So do the communities around this.
	BP Kriel
	Ek wil net seker maak ek verstaan reg as Meneer nou sê, dankie vir daai kommentaar, as Meneer sê die rolspelers en hulle erkom, hoe sien Meneer dit uitspeel, ek wil net seker maak dat ek reg verstaan, is dit as ons kom om hierdie sessies te kom doen moet ons eers met iemand anders gesels het en dan weer kom gesels? Is kyk, daar is 'n bron daar buite nê, en dan is daar 'n paar ouens wat dit, daar is verskillende rolspelers binne wat will help ons daai bron te probeer identifiseer en kyk of dit gaan werk of nie. So elke keer as daar 'n nuwe maatskappy is dan is dit omdat dit iemand anders is wat nou wil kom kyk. So dis 'n ander maatskappy so dis hoekom daar, en ek kan verstaan dat dit deurmekaar raak want ek meen dit is 'n groot klomp verskillende ouens jy weet so ja ek, ek meen hel partykeer vir ons is dit deurmekaar jy weet wie is dit nou, wat is dit nou, wat is die struisie, in ons rol van die hele storie is om, ons werk nie vir hulle nie. Alhoewel hulle betaal vir die studies en goeters wat hulle doen en goeters is dit, dit is die wetlike vereiste, hulle moet betaal daarvoor, so ons doen daai studies en goeters om te kyk of die survey wat ook 'n studie is op sy sie, of hulle dit kan gaan doen en goeters. So daar is 'n klomp verskillende rolspelers, een van die rolspelers is hier vandag, hy is van TGS af so hy is ook hierso,
	Michael I don't know if I can maybe ask you to stand up and say hi, but dis Michael hy is van TGS af, hy kom daar van Houston Texas af. So jy weet hy is van TGS af, hy is nou in die begin fase en hulle doen die geofisiese goeters, dan sal daar nou weer ander rolspelers wees na die tyd wat basies dan die eksplorasie ouens is; so dis die ouens wat die lisensie blokke het en daai tipe goeters. En hulle is dan die ouens, die data wat hulle insamel gaan daai ouens dan gebruik om te kyk oukei waar gaan ons drill, wat gaan ons doen. Maar so deurlopend deur die proses behoort daar dan verskillende ouens hier aan te kom so dis hoekom daar ander ouens hier aangekom het met die drill want hulle wil now kom drill. En dis hoekom hulle kom gesig wys het en kom sê oukei wel dis wie ons is. So dis nou weer 'n ander Amerikaner gewees wat hier opgedaag het. So dit is, so die proses gaan aan en daar is verskillende ouens wat soos die proses aanloop deel raak van die hele storie. So as daai ouens klaar is sal daar dan teen een weer 'n ander gesig opdaag en daai ou gaan dan van die produksie maatskappy wees verstaan, so dis omdat dit verskillende stappe van die proses is wat dit dan gaan wees. Wat belangrik is; is dat hulle wel moet kom en kom gesig wys en sê dis hoekom ons hier is en dit is wat ons wil doen, verstaan? So dit is die belangrike deel. En as daar dan 'n EIA is of iets soos dit wat gedoen moet word dan is dit belangrik jy weet dat hulle deur al daai hoops en al daai goeters spring om te kyk of dit actually kan aangaan of nie. So, ek weet nie of dit jou vraag beantwoord nie, ek het dit nou probeer beantwoord, so bietjie, maar as dit nodig is dat ons dit op 'n ander manier verduidelik, ek weet nie of dit daik die vraag beantwoord het nie.

Item No	Item
	I just want to make sure I understand correctly when Sir says now, thank you for those comments, if Sir says the cast members and they acknowledge, how does Sir see this playing out, I just want to make sure I understand correctly, is it when we come to do these sessions we should have talked to someone else first and then come and chat again? yes look, there's a source out there huh, and then there's some guys that have it, there are different players inside who want to help identify that source and see if it's going to work or not. So every time there's a new company then it's because it's someone else who wants to come and see now. So it's a different company so that's why there, and I can understand it getting messed up because I think it's a big bunch of different guys you know so yes I, I think hell sometimes for us it's messed up you know who is it now, what is it now, what's the situation, in our role of the whole story is to, we don't work for them. Although they pay for the studies and things they do and things are that, that's the legal requirement, they have to pay for it, so we do those studies and things to see if the survey that's also a study on its own, if they can go and do it and go-getters. So there's a bunch of different cast members, one of the cast members is here today, he's from TGS so he's here too. *Michael I don't know if I can maybe ask you to stand up and say hi, but it's Michael he's from TGS, he's from Houston Texas there. So you know he's from TGS, he's in the beginning phase now and they're doing the geophysical stuff, then there's going to be other players now after the time that's basically then the exploration guys, so it's the guys who have the license blocks and those types of things. And they're the guys then, the data they collect is going to use those guys then to look okay where are we going to drill, what are we going to do But so continuously throughout the process, there should be different guys coming on here then so that's why there are other guys coming here with the drizzle because they want to come and drill now. And that's why they came to show face and come and say okay well that's who we are. So it's now another American who showed up here. So it is, so the process goes on and there are different guys that like the process going on become part of the whole story. So when those guys are done, there's going to be another face ten against one and that guy is going to be from the production company, so that's because it's different steps of the process that it's going to be then. Which is important is that they do have to come and show face and say that's why we're here and that's what we want to do, understand? So that's the important part. And then if there's an EIA or something like that that that needs to be done then it's important you know that they're jumping through all those hoops and all those things to see if it can actually go on or not. So, I don't know if that answers your question, I've tried to answer it now, that bit, but if it's necessary that we explain it in a different way, I don't know if it might have answered the question.*
L	**Nicolaas Cloete** **Wanneer die proseses moet begin het ons byvoorbeeld verskillende departemente, hetsy is dit die departement by, in wette, marine protected area wat veronderstel is om dan daarso te kan wees of die environmental affairs right, so die omgewings wat die omgewing moet beskerm moet dan eintlik saam met julle op hierdie train is, right. Nou kom julle alleen en op die einde van die dag by die goedkeuring kom teken hulle net 'n blok af; environment sê dit is orraait so. So waar is daai connection? Daar is nie 'n connection nie. OP hierdie stadium wat ek beleef by die Meneer, ons staan op hierdie stadium alleen. En dis nie veronderstel om te wees nie want government het sisteme in plek in om ons dan te kan probeer beskerm en dit is wat die Meneer sê in dieselfde asem wil ek sommer van die geleentheid gebruik maak om dan ook te vra dat die vissers wat nou kwotas het, ons moet weet presies waar staan julle sodat ons vir Saldanha en Lambertsbaai en Doringbaai en Paternoster en whoever kan gesê, luister hier maar Hondeklipbaai se vissers sê hulle staan so, hulle staan vir die seismiese blasting en vir olie se boor, sodat daar 'n boodskap kan gestuur word in die society Hondeklipbaai sal moet weet en ons sal die vissers, julle moet eintlik op julle se agenda ook sê luister hierso dit is wat julle sê.**

Item No	Item
	Maar die boodskap moet so deurgedra word, een kan nie net so sê want as julle is in 'n organisasie in en die ander een sê so nie verstaan jy daar moet soort van 'n mate van dat die vissers, of nou onderster gestel die kwota houers wat nou huidiglik nou hier is, ons ander is ook vissers wat hierdie snoek permits had, dit affekteer ook vir ons alhoewel ons nie die kwota gehad het nie so is nie net dat daai manse die grouping dan nou sê nie maar die manne wat dan nou die kwotas had moet 'n boodskap uitstuur sodat ons kan weet waar ons staan, elke man kan nie in 'n organisasie praat soos 'n lap wat skeur en dan kom sê nee luister ek stem nie stem nie, die man sê so nie. Vissers maak 'n besluit sodat ons kan sê hierso dit is wat die vissers wat kwotas had sê. Ek dink dit is belangrik sodat ons by die volgende vergadering nie met 'n klomp stories hierso staan en aankom nie. Die man en die vissers moet 'n besluit maakSo, ek sê nie dit moet nou wees nie maar dit is volgende op die agenda as ons hier moet kom sodat ons kan weet waar ons staan. When the processes must start we have different departments, for example, whether it's the department at, in laws, marine protected area that is supposed to then be able to be thereso or the environmental affairs right, so the environments that need to protect the environment should then actually be on this train with you, right. Now you come alone and at the end of the day at the approval they just sign off a block; it says it's orsait like that. So where is that connection? There isn't a connection. AT this point I'm experiencing with the Sir, we're standing alone at this point. And it's not supposed to be because we have systems in place to be able to try to protect us and that's what the Sir says in the same breath, I just want to take the opportunity to ask that the fishermen who now have quotas, we need to know exactly where do you stand so that we can say to Saldanha and Lamberts Bay and Thorn Bay and Paternoster and whoever. listen here but Hondeklip Bay's fishermen say they stand like this. they stand for the seismic blasting and for oil's drilling so there can be a message sent in the society Hondeklip Bay will have to know and we will the fishermen, you should actually on your agenda also say listenstr hereso that's what you say. But the message has to be carried through like this, one can't just say so because if you're in an organization in and the other one says so don't understand you there must kind of be some degree that the fishermen, or now put the other star the quota of containers that are now here now, we others are also fishermen who had these pike permits, it also affects us even though we didn't have the quota so is not only that those people say the grouping now but the men who then have the quotas now have to send out a message so we can know where we stand, every man can't talk in an organization like a rag tearing and then come and say no listen I don't agree, The man doesn't say so. fishermen make a decision so we can say hereso that's what the fishermen who had quotas say. I think it's important so that at the next meeting we don't stand here with a bunch of stories and arrive. The man and the fishermen have to make a decisionSo, I'm not saying it should be now but it's next on the agenda if we need to get here so we can know where we stand. **GP Kriel** Ja, dis belangrik, ek wil net sê oor die departemente, ek sal ook baie graag wil hê dat hulle hier is. Rêrig, dit sal vir my great wees as ek omgewingsake en mineraalhulpbronne en environmental affairs en al daai ouens hier kan hê om te staan en dit te sê. Ongelukkig gaan daai nie rêrig baie maklik wees om reg te kry nie. Ek sal dit ook wou gehad het, ons noot hulle ook uit, hulle weet ook van die vergaderings, hulle is ook uitgenooi byvoorbeeld as ons 'n miskien 'n virtuele vergadering of iets soos dit hou dan sal hulle partykeer instk en die hele storie maar partykeer kom PASA na die vergaderings toe, Petroleum Agentskap, dan kom sit hulle hierso, hulle is ook deel van die storie, verlede keer toe ons saam met van die ouens gekom het wat die olie boor en goeters kom doen, dan het hulle ook in die gehoor gesit en kom luister en goeters en deelgeneem maar ja ons sal ook bietjie meer insette van daai departemente

	wil hê maar hulle lewer insette op ons verslae en goeters so dit is op 'n indirekte manier maar dis dalk nie direk met die gemeenskap altyd nie.
m.	**Patrick Rutph** Nou hier is myne, selfs al kom die kabinet ook hiernatoe, al bring julle die President ook hiernatoe, en dis wat ek vroeër gesê het, wil hulle vir my kom anderster laat dink en my mind switch, ek staan by wat dit is, dis 'n onding. Ek is hier gebore in hierdie plek in en ek het groot geraak in hierdie plek en het gesien wat hier gebeur, dis kurk dood dis mors dood hier agter, hier lewe dit nog, die enigste hoop, die enigste lewe nog hierso, nie 'n kabinet of 'n Minister of 'n President sal vir my anders oortuig nie. Ek sê dis 'n ondig die, dit moenie gedoen word nie. En Gods gedank kom julle nie net na die vissermanne toe of na die kwota houers toe nie, dis 'n community storietjie hierdie en ons moet almal sê. Die vissers het 'n ander denke van wat, van hierdie dinges en goedtie, dis hoekom ek sê ek is nie selfsugtig wanneer ek sê dat voordele, in watter vorm ook al dit net nie in geld nie, kom ook al, ek verwerp sulke goed. Verstaan, want ek wil hê my kinds kindere moet kan 'n snoek vang, moet kan 'n vrulle kry uit die see uit en 'n kreef boen. Dit sal nie meer gebeur as hier aktiwiteite gaan beginne gaan en dit ek sê nie dit sal môre wees nie, dis 'n langtermyn ding dit sal gebeur hierso, dit sal gebeur, die mense is besig om ons tot niet te maak. Ek het dit ander keer gesê, ek sê dit nou vanaand weer, die mense is besig om ons uit te roei. As ek dit moet so stel, dit kan nie weet dat onse enigste brok wat nog daar is, waar ons na toe kyk ook gekom peuter aan word nie. En dis nou maar tree vir tree, dis nou vandag, nee dit sal nie wees, nee dis maar net so. Wat is volgende keer? Wat is volgende? Dan kom hulle met 'n ander ding. En weer 'n ander ding en weer 'n ander ding. So by so dat hulle die afval gasse ook later by ons kom berg want dit was al op 'n jaar net hier agter by Skulpfontein waar dit die koerasie vol was, en daai goed is ge-oppose in die verlede, dit was hier in die vroeë 70's, 80's was daai goeters gewees. Toe moes ons keer, ek sê ons, toe gaan daar stemme op, want ek was in daai vergaderings gewees. Hoekom moet ons nou weer 'n ding toelaat hier om môre, oormôre weer te probeer keer? So, daar kan nie gesê word ja nie. Daar sal divisions wees, daar sal verskil word hier want die vissermanne weet nie alles nie. En dit kan nie net op hulle-se sê gegaan word nie. En ja soos Dawid daar tereg, sy dinges tereg gestel het, dit is nie net hulle wat visvang nie. Dit is nie net hulle wat visvang nie, so die ander se menig tal ook. Nou my ander vraag, en ek hoor van gesigte kom wys en ander manse en ander companies, so dit is hierdie EIMS, is dit 'n Suid Afrikaanse company? TGS, wat is hy dan, daai wat julle is? Ja voor kom praat ja, maar die companies nou wat julle, is dit almal Suid Afrikaanse companies? So hulle-se direktors en die goed is wie? Is dit, verstaan? Sien, dis daai goeters, ons moet die goed fyn kyk en die goed fyn praat en soos KB gesê het van waar was ons al die tyd, dit is die hoeveelste keer wat, daar is elke keer, soos vanaand, sal die goed terug speel soos wat julle nou die goed record, soos elke mens se brein mos meer is en dan, maar my Here, waarmee is hierdie mense te doen? Daar kry jy weer daai dinges en daai goeters. So ja, en dit word gepraat om die goeters, ons is nie rondom professors en doktors en die goed nie, ons kyk ook nou maar hier op hierdie goed wat ons nou, so swak soos hierdie ding hier, sien julle hierdie pale wat hier staan, Vodacom het hom net gekom neersit, hy werk nie, so ons kry moeilik, ons kry swaar om ingelig te word, verstaan. Ons moet maar opkies, ons moet die draadlose aansit en die goeters. Ja, TV kyk en so aan, maar dis anders nêrens as om so te engage nie. So die vir ons moeilik en ons moet terug kom, by die volgende vergadering sal dit weer geraas word en erger geraas word want dan het ons geloop sien en geloop kry wat, maar ons het daai ding gemis en so aan. So ja, nee dit is verskriklik. *Now here's mine, even if the cabinet comes here as well, even if you bring the President here as well, and that's what I said earlier, they want to come and make me think the other star and my mind switch, I stand by what it is, it's an ending. I was born here in this place and I grew up in this place and saw what*

	happens here. It's cork death it's wasting death behind here, here it is still alive, the only hope, the only life still here, not a cabinet or a Minister or a President will convince me otherwise. I say it's a disservice, it shouldn't be done. And thank Gods you don't just come to the fishermen or to the quota of containers, it's a community story this and we all have to say. The fishermen have a different thinking of what, of these things and things, that's why I say I'm not selfish when I say that benefits, in whatever form they just don't come in money, come in, I reject stuff like that. Understood, because I want my child children to be able to catch a pike, to be able to get a fish out of the sea and a lobster bone. It won't happen anymore if activities are going to start here and that's not saying it will be tomorrow, it's a long term thing it will happen here, it will happen, the people are busy nullifying us. I said it other time, I'm saying it again tonight, the people are eradicating us. *If I have to put it that way, it can't be that our only source that's still there, where we're looking at is also coming along. And it's just step by step, it's today, no it won't be, no it's just like that. What's next then? What's next? Then they come up with another thing. And again another thing and again another thing. So by so that they also come to store the waste gases with us later because it was already a year just back here at Skaapfontein where it filled the newspapers, and that stuff was opposed in the past, it was here in the early 70's, 80's those things were. Then we had to stop, I say we, then votes went up, because I was in those meetings. Why should we allow another thing here now to try to stop tomorrow, tomorrow? So, it cannot be said yes. There will be differences, there will be difference here because the fishermen don't know everything. And it can't just be gone on their say. And yes as David rightly put it, his things on trial, it's not just them fishing. It's not just them fishing, so the others' many count as well. Now my other question, and I hear about faces coming to show and other people and other companies, so it's this EIMS, is it a South African company?* *TGS, what is he then, that you are? Yes before come and speak yes, but the companies now that you are they all South African companies? So their directors and the stuff is who? Is it, understood? See, it's those things, we've got to take a close look at the stuff and talk the stuff fire and as KB said of where have we been all along, it's the umpteenth time that, there's every time, like tonight, the stuff will play back like you're recording the stuff now, like every man's brain is and then, but my Lord, what are these people to do with? There you get those things and those things again. So yes, and it's talked about the stuff, we're not around professors and doctors and the stuff, we're also just looking at this stuff we're doing right now, as weak as this thing here, you see these poles standing here, Vodacom just came to put him down, he's not working, so we're having a hard time, we suffer to be informed, understood. We just have to read up, we have to put on the wireless and the go-getters. Yes, watching TV and so on, but it's nowhere but engaging like that. So it's hard for us and we have to come back, at the next meeting it will get noise again and get worse noise because then we'd see walk and walk get what, but we missed that thing and so on. So yes, no it's terrible.* **SF Kriel** Ons is 'n Suid Afrikaanse maatskappy, TGS is 'n internasionale maatskappy so hulle is in die UK geregistreer. Ja, julle is oorsese ouens, so hulle is 'n oorsese maatskappy. Ja kyk ek meen, ja Mnr Rulfe ons is nie hier om julle te kom stoomroller of iets nie nè, ons is hier om ons werk te kom doen, ons werk is om te kom kyk na die omgewings goeters van verskillende fasette af. So, ons het vir julle gesê daar is marine ekologie, visserye mense, akoestiese ouens, sosiale mense, die erfenis ouens, al daai goeters. En dan gaan ons op 'n manier vir julle kom sê oukei dit is wat ons gekry het uit al daai goeters uit, uit die goeters wat ons gekry het. En ons gaan dit aan julle kom voordra en dit is nie nodig dat julle saamstem nie. Verstaan ons wil julle nie kom oortuig van 'n ding nie. Die ding is om vir julle te kom sê dis die inligting wat ons gekry het, julle is dan geregtig om vir ons julle inligting ook te gee en dan kan ons daar om die tafel sit en gesels.

	En op die ou einde van die dag wil ons julle die reg gee en die geleentheid gee om te reageer op 'n formele manier soos hierdie, en julle is welkom om julle sê te sê. En ek is bly julle sê julle sê. En julle moet dit doen, en dis ons werk om dan seker te maak dat daai sê wat julle gesê het ingaan na die departements toe wat die besluite moet raak of ons daarmee saamstem of nie. So ons hoef nie hier saam te stem oor die goeters wat ons kry nie. En dis die belangrike ding en dis hoekom ek waardeer wat jy gesê het, dit is rêrig goed, so al stem ons nie saam oor die ding nie, dan moet ons nog steeds daai goeters vat en dit instuur vir die departement dat hulle ook 'n besluit kan neem, dat hulle dit duidelik kan sien, daar is detail, Mnr So en So het gesê nee hy stem nie saam met dit nie. So al daai goeters gaan in, en dis belangrik dat daai goeters dan gesê word. En ons moet ook kyk op daai stadium na die impak wat dit op ons impakte het as ek dit so kan stel, so ons gaan kyk partykeer jy weet sê nou maar dis 'n lae impak maar die gemeenskap sê nee dit is nie, dan kyk ons bietjie na daai ding op 'n ander manier en ons probeer dit op 'n ander manier aanspreek. So dis vir ons baie belangrik, ja, dankie vir daai een en julle is maar geregtig, julle kan maar hard praat. *We are a South African company, TGS is an international company so they are registered in the UK. yes, you're overseas guys, so they're an overseas company. yes look I mean, yes Mr Rulfe we're not here to steamroller you guys or anything huh, we're here to come and do our job, our job is to come and look at the environments from different facets. So, we told you there are marine ecologists, fisheries people, acoustic guys, social people, the heritage guys, all those things. And then somehow we're going to come and tell you okay that's what we got out of all those things, out of the stuff we got. And we're going to come and recite it to you and there's no need for you to agree. Understand we don't want to come and convince you of a thing. The thing is to come and tell you it's the information we got, you're enabled to give us your information as well and then we can sit around the table and chat.* *And at the end of the day, we want to give you the right and the opportunity to respond in a formal way like this, and you're welcome to have your say. And I'm glad you say you say. And you have to do that, and it's our job to then make sure that what you said goes into the departments that have to make the decisions whether we agree with it or not. So we don't have to agree here on the stuff we get. And that's the important thing and that's why I appreciate what you said, it's really good, so even if we don't agree on the thing, then we still have to take those things and send them in for the department that they can also make a decision, that they can see it clearly, there's detail, Mr So and So said no he disagreed with that. So all those things go in, and it's important that those things are said then. And we also have to look at the impact it has on our impacts at that point, if I can put it that way, so we're going to look sometimes you know say it's a low impact but the community says no it's not, then we look at that thing in a different way and we try to address it in a different way. So it's very important to us, yes, thank you for that one and you're just entitled, you can just speak loudly.*
n.	**David Marius** Wat is die algemene gevoel in die ander gemeenskappe hieroor? Weg van die beskuit is die mense. En ons sal moet wakker pies oor hier vanaf verder voortmoe, en nie vaak pies nie. 'n Mens kry wakker pies en vaak pies, maar dankie eers. So ons sal moet wakker wees want die regering kom en dan maak hy soos hy wil, ons sê asseblief tog moenie so maak nie dan maak hy presies wat jy sê moenie so maak nie, dis wat hy doen. En die algemene gevoel op die Wes Kus, soos die Meneer nou daar sê wat daarem nou al ge-travel het nou, ek wonder hy het nog nie blou kolle op sy lyf gehad of hierdie goeters... Dit was naby, maar die tank en die knap is mense [moet met hom? Ons moet saamstaan in hierdie verband. En dat ons nie kyk na 'n kortstrmyn plan om te sê ek sal nou 'n kontrak kry want miskien, die manne wat once even nou ook kom en kom staan en sê nee, dan sal die man wat gedink het ook hier is 'n kontrak dan floor hy sommer uit die saal uit want hy het gekom en gehoop en gedink hier sal darem

Item No	Item
	'n plan uitspring. Maar ons sal moet saam staan en daar soos ek gesê het, daar is 'n spreekwoord wat sê; as ons wil vinnig beweeg, gaan alleen, maar as ons wil ver beweeg moet ons saam beweeg, if you want to go fast, go alone, if you want to go far, go together. En ons moet daai togetherness hê, om te sê luister hierso laat ons bewaar vir generasies om te kan kom. Ek verstaan die menere se dynamics, hulle het 'n werk om te vervul, maar hulle kan ook hoor die pleidooi want ons moet op 'n stadium ook die mondstuk wees vir die wat nie kan praat nie, maar die diere het die vermoë om te kan praat, nie onse taal nie, wat ons nou praat, maar hulle kan sê maar dit is nie reg nie, moenie so maak nie en dit is van die Christelike kant af het ons as die Ons is die hoof, ons is die dominion gekry óf die beheer en die besluitneming oor die diere, maar wanneer ons 'n besluit maak, moet dioen, moet dit ten gunste van hulle ook wees. Ons het 'n funksie en 'n verantwoordelikheid om in harmonie met mekaar saam te lewe met die natuur saam. As ons nie dit gaan doen nie is ons on deadly ground want ons moet besef soos daai ou geleerd, nie eens 'n geleerde nie, of 'n akademikus nie, om te sê geld sal ons nie kan eet nie, die mense was al hier gewees, kyk hoe lyk ons, waar is die rehabilitasie, waar is die one, two, three? Dit sal weer gebeur, dink jy die geskiedenis sal hom nie weer herhaal nie. Ons sal moet fools wees om dan te kan dink dit gaan nie gebeur nie. So daai navorsingstuk, of hy nou wat hulle gesê het in die artikel, sê hulle die vlamme het gebars, en sover soos 64 kilometer met die olieboor was daar 'n probleem gewees. Nou 64 kilometer is so ver hiervan af soos Klipfontein, kon hulle die vlamme gesien het in die see in, in Amerika in, en toe loop sak daai hele olieboor en daai hele spillage en dit was vir 'n, ek meen dit is 'n lifetime ding, so mense ek dink ek is ge-cover oers met dit saam. As ons sê dat die algemene gevoel is op die Weskus om te sê asseblief tog moenie, ons is bestaanmakers ons kan onse lewe hier maak, ons kan onse broodjie maak, maar maak julle 'n fout daarso dan is ons ge-doom. Dan sit ons in 'n groot probleem. *What is the general feeling in the other communities about this? Away from the decision are the people. And we'll have to wake up eating pies here from further ahead, and not vaak pies. One gets woke pies and faint pies, but thank you first. So we're going to have to be awake because the government comes and then he makes as he pleases, we say please don't make it like that then he makes exactly what you say don't make it so, that's what he does. And the general feeling on the West Coast, as the Sir says there now, I wonder he hasn't had blue spots on his body or these things...* *It was close, but the tall and the handsome are people I must with him? We need to stand by in this regard. And that we're not looking at a short-term plan to say I'll get a contract now because maybe, the guys who come and stand and say no, then the guy who thought here was a contract then he'll just come out of the hall because he came and hoped and thought here at least a plan would jump out. But we're going to have to stand together and there as I said, there's a saying that says; if we want to move fast, go alone, but if we want to move far we have to move together, if you want to go fast, go alone, if you want to go far, go together. And we have to have that togetherness, to say listen hereso let's preserve for generations to come. I understand the gentlemen's dynamics, they have a job to fulfill, but they can also hear the plea because at some point we also have to be the mouthpiece for those who can't speak, but the animals have the ability to be able to speak, not our language, which we speak now, but they can say but it's not right, don't make it that way and it's from the Christian side we as the Ons are the head, we've been given the dominion or the control and the decision-making about the animals, but when we make a decision, it has to be in favor of them too. We have a function and a responsibility to live in harmony with each other with nature together. If we're not going to do that we're on deadly ground because we have to realize like that old scholar, not even a scholar, or an academic, to say money won't be able to eat us, the people have been here, look what we look like, where's the rehabilitation, where's the one, two, three? It will happen again, do you think history will not repeat itself again. We're going to have to be fools to then be able to think it's not going to happen. So that research piece, whether he said what they said in the article, they say the flames burst, and as far as 64 kilometres with the oil rig there was a problem. Now 64 kilometres is as far from this as Klipfontein, they could have seen the flames*

	into the sea, into America, and then that whole oil drill and that whole spillage and it was for a, I think it's a lifetime thing, so people I think I'm covered with it first. If we say that the general feeling is on the West Coast to say please don't, we're subsistence fishermen we can make our life here, we can make our bun, but make a mistake thereso then we're doomed. Then we're stuck in a big problem. **GP Kriel** Die algemene gevoel wat ons gekry het sover is dat daar, is dat die mense bietjie gekant is daarteen so ek gaan nou maar bietjie oop kaarte met julle speel. Ja so dit was maar die gevoel gewees, so jy weet reg van Houtbaai af tot by, ons was in Kaapstad geweet, Saldanha en al daai plekke ook so die mense het hulle sê kom sê, net soos wat julle nou julle sê kom sê het. *The general feeling we've gotten so for is that there's that the people are a little opposed to it so I'm just going to play some open cards with you guys now. yes so that was just the feeling, so you know right from Hout Bay to, we were in Cape Town, Saldanha and all those places as well so the people come to say their say, just like you come to say your say.*

'n Openbare vergadering is geskeduleer tydens die voorraansoekfase met die Belanghebbende en Geaffekteerde Partye (I&APs). Die doel van die vergadering was om die aanvanklike bekommernisse van die lede van die publiek en belangrike I&APs vas te lê. Die gemeenskap het opgedaag met plakkate en het aanvanklik die vergadering bygewoon, maar het geweier om die bywonings register te teken. Nadat Mnr GP Kriel vir hulle probeer verduidelik het hoekom dit belangrik is om die register te teken en dat dit nie toestemming vir die projek sou gee nie, het hulle besluit om die vergadering te verlaat voordat enige voordrag aan hulle gemaak kon word.

A public meeting is scheduled during the pre-application phase with the Interested and Affected Parties (I&APs). The purpose of the meeting was to capture the initial concerns of the members of the public and key I&APs. The community showed up with placards and initially attended the meeting, but refused to sign the attendance register. After Mr GP Kriel tried to explain to them why it was important to sign the register and that it would not consent to the project, they decided to leave the meeting before any presentation could be made to them.

EIMS

Minutes of Meeting

EIMS Ref	1520	Project Name	TGS Reconnaissance Basic Assessment

Minutes

Item No	Item	Action	Date
1	**Introductions**		
	GPK introduced the meeting attendees and the purpose of the meeting.	All	Note
2	**Project Background and Description**		
	GPK provided a description of the project in terms of the location of the project, a brief description of the 3D survey proposed to be undertaken, the planned Public Participation and Specialist Studies proposed.	All	Note
3	**Project Approach and Timeframes**		
	GPK presented the NEMA listed activity as being LN1 Activity 21(b) and presented the Basic Assessment and the proposed Public Participation approach.	All	Note
4	**Discussion**		
4.1	GPK indicated that the deadline for the submission of the EA Application was 6 September 2022. GPK noted that a second 30 day BA review period may be required to ensure all concerns are captured. PN that the timing of submission of the application should ideally leave sufficient time for the adequate comment period in order to avoid having to apply for extension in terms of Regulation 3(7). The online portal was not ready yet, and as a result an Electronic EA Application submission via email would be acceptable.	All	Note
4.2	PN highlighted that it would be important to consult with the relevant organisations and stakeholders – and it was important to engage with the Indigenous leaders from the Khoi and San communities and the South African United Fishers Front.	All	Note
4.3	PN confirmed that this application relates to Section 74 of the MPRDA as a Reconnaissance Permit would be required.	All	Note
4.4	GPK asked for PASA for information on any other decision support tools. PN responded that PASA has their own public participation consultation guideline but the NEMA guideline covers this so she	All	Note

Item No	Item	Action	Date
	suggested that the DFFE guideline should be followed. She indicated that EIMS should focus on the EIA regulations and the Needs and Desirability guidelines.		
4.5	GPK asked for clarification on the cumulative impact assessment as it looks like there are multiple application proposed for the same area. PN responded that for now cumulative impacts must be considered in terms of multiple pending reconnaissance permit applications or exploration activities in the area. PN acknowledged that their licensing and regulations department are preparing a response regarding potential multiple reconnaissance permits over the same area but for now.	All	Note
4.6	GPK requested details on hard or electronic copy submission of documents and asked if the PASA online portal was up and running and asked for clarification regarding email transmission and whether the electronic submission proof would be adequate in terms of meeting submission deadlines. PN responded that the portal is not ready yet. PN indicated that electronic submission to the PASA applications administrator would be satisfactory but 1 hard copy of the draft and final BA reports would be required as well as an electronic copy. PN confirmed that this would be satisfactory as long as an overnight courier hard copy would be received shortly thereafter.	All	Note
4.7	JH asked if there was any intention for PASA to do any engagements with the communities considering the scrutiny that these types of projects are facing in South Africa at the moment. PN confirmed that there are a number of pre-colloquium events being planned that would address the impact of climate change, the co-existence of oil and gas with fisheries, etc. in the coming months.		

The meeting closed at 12:30.

Item No	Item
1.	Alle deelnemers is versoek om die bywoningsregister te onderteken soos hulle ingeskryf het. Aanbieding van EIMS van die projekbeskrywing, aansoekproses en omgewingsversagtings tydens seismiese opname is gelewer volgens die agenda hierbo aan die vergaderinggangers. Daar is aangedui dat die vergadering opgeneem sou word vir die doeleindes van akkurate notule neem. Agtergrondinligtingsdokumente (in Engels, Afrikaans en isiXhosa), kommentaarvorms, registrasie, inligtingsuitdeelstukke en bywoningsregisters is by die vergadering beskikbaar gestel. Die deelnemers is aangemoedig om hul kommentaar en bekommernisse in te dien deur die kommentaarvorms in te vul wat verskaf word of deur kommentaar in te dien by die projek-e-posadres wat verskaf is. Daar is opgemerk dat alle deelnemers wat hul kontakbesonderhede verskaf het, by verstek geregistreer sal word op die I&AP-databasis wat deur EIMS gehandhaaf word. Na aanleiding van die aanbiedings is die vloer oopgemaak vir 'n bespreking en die deelnemers is aangemoedig om enige vrae of bekommernisse wat hulle oor die projek gehad het, op te stel. *All attendees were requested to sign the attendance register as they entered. Presentation from EIMS of the project description, application process and environmental mitigations during seismic survey were delivered as per the agenda above to the meeting attendees. It was indicated that the meeting would be recorded for the purposes of accurate minute taking. Background Information Documents (in English, Afrikaans and isiXhosa), comments forms, registration, information handouts and attendance registers, were made available at the meeting.* *The attendees were encouraged to submit their comments and concerns through filling in the comment forms provided or by submitting comments to the project email address provided. It was noted that all attendees who have provided their contact details would be registered by default on the I&AP database maintained by EIMS. Following the presentations, the floor was opened for a discussion and the attendees were encouraged to bring up any questions or concerns they had about the project.*
2.	**Vrae en Antwoord/ *Questions and Answers***
a.	**Mrs Moyser** What assurance is there that the rules will be followed – we know that there are monitors on board the vessel, but in these days, it is sometimes difficult to be confident that the requirements will be implemented as required. What reporting mechanisms are in place to ensure compliance. *Watter versekering is daar dat die reëls gevolg sal word - ons weet dat daar monitors aan boord van die vaartuig is, maar in hierdie dae is dit soms moeilik om vol vertroue te wees dat die vereistes geïmplementeer sal word soos vereis. Watter verslagdoeningsmeganismes in plek is om nakoming te verseker.* **dP Briel** Thank you – that is a good question. It is important to remember that this is an international company that cannot afford to slip up on compliance, since the reputational damage alone will be a massive factor. Furthermore, in the EMPr there are clear requirements for independent Environmental Control Officers (ECO), Marine Mammal Observers (MMO), Passive Acoustics Monitors (PAM) and Fisheries Liaison Officers (FLO). These independent officers are there to monitor and ensure that the requirements of the Environmental Authorisation and EMPr are carried out. The MMOs and PAMs will inform the vessel officers of the need to stop for any animals within the safety zone around the boat, and will do daily,

	weekly and monthly reporting to the PASA on the level of compliance with the requirements. The independence is key and there is also external independent audits on these operations. *Dankie – dit is 'n goeie vraag. Dit is belangrik om te onthou dat dit 'n internasionale maatskappy is wat nie kan bekostig om te versteen nie, aangesien die reputasieskade alleen 'n massiewe faktor sal wees. Verder is daar in die EMPr duidelike vereistes vir onafhanklike omgewingsbeheerbeamptes (ECO), mariene soogdierwaarnemers (MMO), passiewe akoestiekmonitors (PAM) en visseryskakelbeamptes (FLO). Hierdie onafhanklike beamptes is daar om te monitor en te verseker dat die vereistes van die Omgewingsmagtiging en EMPr uitgevoer word. Die MMO's en PAM's sal die voorsuigbeamptes inlig oor die noodsaaklikheid om vir enige diere binne die veiligheidszone rondom die boot te stop, en sal doeglik, weeklik en maandelik aan die PASA verslag doen oor die vlak van voldoening aan die vereistes. Die onafhanklikheid is die sleutel en daar is ook eksterne onafhanklike oudits oor hierdie bedrywighede.* **Ruelian Bally** There are very clear guidelines that are required and if they don't follow these rules on the vessel, then we report on that and there would then be consequences for them. In general, it must be said, that we find that the survey activities comply with the EMPr. *Daar is baie duidelike riglyne wat vereis word en as hulle nie hierdie reëls op die vaartuig volg nie, rapporteer ons daaroor en daar sal dan gevolge vir hulle wees. Oor die algemeen moet gesê word dat ons vind dat die opname-aktiwiteite aan die EMPr voldoen.*
b.	**Fisherman (Aokotowa fisheries)** Aan Ruelian wat op die bote werk – julle moet nou eerlik vir ons sê of dit wat hulle hier gesê het die waarheid is. *To Ruelian working on the boats – you must now honestly tell us whether what they have said here is the truth.* **Ruelian Bally** Ja alles wat hulle vir ons vertel het is waar. *Yes, everything they told us is true.*

EIMS	NOTULE VAN VERGADERING/ *MINUTES OF MEETING*		
EIMS Verw./ *EIMS Ref*	1520	Projek Naam/ *Project Name*	TGS VERKENNING BA/ *TGS RECONNAISSANCE BA*

NOTULE/ *MINUTES*

Item No	Item
1.	Alle deelnemers is versoek om die bywoningsregister te onderteken soos hulle ingeskryf het. Aanbieding van EIMS van die projekbeskrywing, aansoekproses en omgewingsversagtings tydens seismiese opname is gelewer volgens die agenda hierbo aan die vergaderinggangers. Daar is aangedui dat die vergadering opgeneem sou word vir die doeleindes van akkurate notule neem. Agtergrondinligtingsdokumente (in Engels, Afrikaans en isiXhosa), kommentaarvorms, registrasie, inligtingsuitdeelstukke en bywoningsregisters is by die vergadering beskikbaar gestel. Die deelnemers is aangemoedig om hul kommentaar en bekommernisse in te dien deur die kommentaarvorms in te vul wat verskaf word of deur kommentaar in te dien by die projek-e-posadres wat verskaf is. Daar is opgemerk dat alle deelnemers wat hul kontakbesonderhede verskaf het, by verstek geregistreer sal word op die I&AP-databasis wat deur EIMS gehandhaaf word. Na aanleiding van die aanbiedings is die vloer oopgemaak vir 'n bespreking en die deelnemers is aangemoedig om enige vrae of bekommernisse wat hulle oor die projek gehad het, op te stel. *All attendees were requested to sign the attendance register as they entered. Presentation from EIMS of the project description, application process and environmental mitigations during seismic survey were delivered as per the agenda above to the meeting attendees. It was indicated that the meeting would be recorded for the purposes of accurate minute taking. Background information Documents (in English, Afrikaans and isiXhosa), comments forms, registration, information handouts and attendance registers, were made available at the meeting.* *The attendees were encouraged to submit their comments and concerns through filling in the comment forms provided or by submitting comments to the project email address provided. It was noted that all attendees who have provided their contact details would be registered by default on the I&AP database maintained by EIMS. Following the presentations, the floor was opened for a discussion and the attendees were encouraged to bring up any questions or concerns they had about the project.*
2.	**Vraag en Antwoord/ *Questions and Answers***
a.	**Carisa Soudens** Dit wil vir my voorkom dat die vergadering nie reg geadverteer is nie, want daar is baie min mense hier. Ons is bekommerd dat dit 'n baie belangrike vergadering is wat die mense klaarblyklik nie kennis van dra nie. Ek het nie geweet van die vergadering tot vanoggend nie. *(Mev Soudens is ingeskuit in die lys van mense vir wie eposse gestuur is oor die vergadering)* *It seems to me that the meeting was not advertised correctly, because there are very few people here. We are concerned that this is a very important meeting that the people are evidently not aware of. I didn't know about the meeting until this morning. (Mrs Soudens is included in the list of people for whom emails were sent about the meeting)* **GP Kriel** Dit was regtig nie ons intensie om mense uit te sluit nie. Ons het ons databasis opdateer met die inligting van die vorige vergaderings en ons het vir hierdie vergadering kennisgewing uitgestuur per epos, sms, fax en pos vir die mense op ons databasis vir hierdie projek. Ons het egter nie beheer oor of die mense kies om die vergadering by te woon nie. *It really wasn't our intention to exclude people. We updated our database with the information from the previous meetings and we sent out notice for this meeting by email, text, fax and mail to the people on*

	our database for this project. However, we do not have control over whether the people choose to attend the meeting.
b.	**David Markus** Ek wil aansluit by Carisa – ek is op die Kamiesberg Munisipaliteit raad en ek het geen kennisgewing van die vergadering gekry nie. (*Mnr Markus is ingesluit in die lys van mense vir wie eposse gestuur is oor die vergadering*). Die vergadering moet geherskeduleer word. Die munisipaliteit het ons nie laat weet nie. Ons kan nie selektief wees nie. Ons moet saamstaan. Julle moet julle kant skoon hou, hierdie munisipaliteit is 'n korrupte munisipaliteit. Wat doen julle om die kommunikasie stelsel te verbeter. Wat is die inhoud van die vergadering met die Munisipaliteit. Dit is fishy en julle kom baie mischievous voor. *I want to second Carisa – I am on the Kamiesberg Municipality Council and I received no notice of the meeting. (Mr Mark is included in the list of people for whom emails were sent about the meeting). The meeting must be rescheduled. The municipality did not let us know. We can't be selective. We must stand together. You have to keep your side clean, this municipality is a corrupt municipality. What are you doing to improve the communication system? What is the content of the meeting with the Municipality. It is fishy and you guys come across as very mischievous.* **GP Kriel** Ons het ons databasis opdateer met die inligting van die vorige vergaderings en ons het vir hierdie vergadering kennisgewing uitgestuur per epos, sms, faks en pos vir die mense op ons databasis vir hierdie projek. Ons het egter nie beheer oor of die mense kies om die vergadering by te woon nie. Ons het selfs met die munisipale bestuur met die verteenwoordigers op Garies 'n vergadering gestuur. Ons het die regulasies gevolg en ons het almal in kennis gestel wat gesê het hulle stel belang in die projek. Die inhoud van die vergadering was presies dieselfde as dit wat ons vir julle hier gewys het, Mev Soudens was ook vanoggend daar en sal dit kan beaam. Ons kan selfs deur die vrae en antwoorde gaan as julle wil. Ons kan ongelukkig nie verantwoording doen vir die munisipale strukture en hoe hulle intern kommunikeer nie. Ons doen ons bes om seker te maak dat ons almal inlig wat belangstel en geregistreer is. Bevestig asseblief vir ons julle kontak besonderhede. Ons het ook 'n datavrye weergawe van die verslag en die verslag is ook beskikbaar op die dorp en ons het ook 'n opsomming van die verslag beskikbaar gestel. *We updated our database with the information from the previous meetings and we sent out notice for this meeting by email, text, fax and mail to the people on our database for this project. However, we do not have control over whether the people choose to attend the meeting. We even sent a meeting with the municipal management with the representatives at Garies. We followed the regulations and we notified everyone who said they were interested in the project. The contents of the meeting were exactly the same as what we showed you here, Mrs Soudens was also there this morning and will be able to echo that. We can even go through the questions and answers if you want. Unfortunately, we cannot account for the municipal structures and how they communicate internally. We do our best to make sure that we inform everyone who is interested and registered. Please confirm for us your contact details. We also have a data-free version of the report and the report is also available on the town and we have also made a summary of the report available.* **Nico Bezuidenhout** Ons wil net bevestig, daar is geen besluitneming wat plaasvind by die vergaderings nie, dit is vir kommentaar en terugvoering oor die bevindinge van die verslag. *We just want to confirm, there is no decision-making that takes place at the meetings. It is for comments and feedback on the findings of the report.*

Item No	Item
	GP Kriel Dit is korrek. Ons sal al die kommentaar wat ons gekry het insluit in ons verslag en dit dan aan die bevoegde owerhede stuur om die besluit te maak. *That is correct. We will include all the comments we have received in our report and then send them to the competent authorities to make the decision.*
c.	**John Adams** Die vergadering gaan te vinnig. Ons wil verstaan hoe die proses loop van punt A na punt B. Ons is bietjie deurmekaar want dit is 'n soortgelyke voorlegging wat gedoen word, vir 'n ander maatskappy, en daar word gesê dat dit net kommentaar is, maar dan hoor ons by 'n volgende keer dat daar aansoek gedoen word. Ons is behoeftige gemeenskappe en het in die verlede voorgestel dat daar plan gemaak word om te kyk of daar iets gedoen kan word hier. Ek sal graag ook net wil verstaan wat in die vergadering in Garies gesê is. *The meeting goes too fast. We want to understand how the process runs from point A to point B. We're a bit confused because it's a similar submission that's being done, for another company, and it's said that it's just comments, but then we'll hear at a next time there's an application. We are needy communities and have in the past suggested that plans be made to see if anything can be done here. I would also like to understand just what was said in the meeting in Garies.* **GP Kriel** Laat ek begin by wat in Garies se vergadering gesê is. Ons het duidelikheid gegee oor die bestuursplan en die versagtings maatreëls en hoe dit uitgevoer sal word. Daar is gevra oor of dit Vaalputs gaan affekteer. Ons het gesê dat dit nie die Vaalputs gaan beïnvloed nie. Daar is verder ook gesels oor die impak van sin en gees van plek en ook oor die sensitiewe areas soos die seemounts, ens. en hoe die klankgolwe deur die water sal trek. Daar is kritiese biodiversiteitsareas en ons sal later daar oor gesels. GP het 'n oorsig gegee oor die aansoek proses. *Let me start from what was said in Garies' meeting. We have provided clarity on the management plan and the mitigation measures and how they will be carried out. It was asked whether it would affect Vaalputs. We said that this was not going to affect the Vaalputs. There was also discussion about the impact of sense and spirit of place and also about the sensitive areas such as the seamounts, etc. and how the sound waves will pull through the water. There are critical biodiversity areas and we will talk about them later.* *GP gave an overview of the application process.*
d.	**John Adams** A en dan B (dit is Searcher en TGS) daar is areas wat oorvleuel en ons wil net uitsluitsel kry oor of altwee maatskappye aansoek gedoen het en of hulle al twee goedkeuring kan kry? En ook of die goedkeuring op 'n hoër vlak gedoen word. *A and then B (that's Searcher and TGS) there are areas that overlap and we just want to get some closure on whether both companies have applied and whether they can get both approval? And also whether the approval is done at a higher level.* **GP Kriel**

Item No	Item
	GP het 'n kaart gewys wat die Searcher en TGS aansoek areas wys en hoe hulle oorvleuel. TGS se area is groter. Die lisensieblokke sal heel moontlike bepaal watter kliënte hulle sal hê. Die departement sal op die ou einde van die dag die besluit neem oor die goedkeuring al dan nie. Hulle kan nie op dieselfde area op dieselfde tyd werk nie en ons het ook na die kumulatiewe impak van so 'n scenario gaan kyk. Die uiteinde van die geraas modellering het bevestig dat as hulle verder as 40 km van mekaar af werk behoort daar nie 'n kumulatiewe impak te wees nie. Dit is hoogs onwaarskynlik dat hulle dieselfde area sal survey, bloot van 'n kommersiële perspektief. *GP showed a map showing the Searcher and TGS application areas and how they overlapped. TGS's area is larger. The license blocks will most likely determine what customers they will have. At the end of the day, the department will make the decision on whether or not to approve it. They cannot work in the same area at the same time and we also looked at the cumulative impact of such a scenario. The outcome of the noise modelling confirmed that if they work further than 40 km apart there should not be a cumulative impact. It is highly unlikely that they will survey the same area, simply from a commercial perspective.*
e.	**Carissa Saudens** Ek het nou vanoggend se vergadering waargeneem en ek het toe nou weer op sosiale media ingegaan en ek verstaan dat daar in die verslag moet staan oor die werksgeleenthede wat geskep gaan word. Ek verstaan ook dat in die hofbeslissing teen Searcher is daar gestel dat julle vir ons gedetailleerde inligting moet gee oor die werksgeleenthede wat geskep gaan word. Searcher sê nou dat daar olie en gas is, maar ten koste van wat sal dit wees. En as daar olie en gas gevind word, watter infrastruktuur sal dit voortbring op die land of gebruik. En as daar enige probleme kom, is daar enige waarborge vir die visbedryf, want dit is waar die probleme gaan kom as daar iets verkeerd gaan? Wat is die waarde van die visbedryf in die toekoms vorentoe. Is die risiko evalueer en is daar syfers vir ons? Ons is skrikkerig want ons het gesien hoe die myne ryk geword het en toe geloop het, *I have now observed this morning's meeting and I have now gone back into social media and I understand that it must be stated in the report about the jobs that are going to be created. I also understand that in the court decision against Searcher it was stated that you should give us detailed information about the jobs that will be created.* *Searcher now says that there is oil and gas, but at the expense of what it will be. And if oil and gas are found, what infrastructure will it produce on land or use.* *And if any problems come, are there any guarantees for the fishing industry, because that's where the problems are going to come from if something goes wrong? What is the value of the fishing industry going forward. Have the risk been evaluated and are there figures for us? We are startled because we saw how the mines got rich and then walked.* **GP Kriel** Ons wil nie leë beloftes kom maak nie. Vir hierdie projek gaan daar nie noemenswaardige werkskepping wees nie. Dit is ver van die kus af en as hulle mobiliseer gaan hulle van Kaapstad of Saldanha se kant af mobiliseer. En dit is gespesialiseerd. Ons kan ongelukkig nie vir julle uitsluitsel gee oor die gas en die olie en die infrastruktuur nie, omdat buite die bestek van hierdie projek is en om dat dit nog nie bekend is wat gekry gaan word of nie. TGS wil as deel van hierdie survey die TGS wil as deel van hierdie survey die onderliggende gesteentes gaan identifiseer en dan kan ander eksplorasie maatskappye soos byvoorbeeld Azinam (Eco-Atlantic) dit

Item No	Item
	gebruik om te besluit waar hulle wil boor om te toets of daar olie of gas is. Die infrastruktuur kan eers beplan word in moontlike toekomstige produksie fase. Dit sal dus baie onverantwoordelik wees vir my om nou te kom stel watse infrastruktuur daar sal wees as ons nie die besonderhede daarvan weet nie. Oor die waarborge, eerstens is die eerste punt dat daar net regtig een vissery bedryf is wat geaffekteer gaan word. Ons het dan ook gaan seker maak dat daar terugvoerings meganismes is soos die interaksie met die gemeenskappe, die verdere navorsing oor visspesies, die geraas monitering, ens. sodat as daar dan 'n rooi vlag is dat 'n mens dan beter besluite kan maak. Daar is ongelukkig nie 'n vaste waarde oor die vissery bedryf nie, dit sal in 'n mate afhang van die bron wat gekry word, indien wel. *We don't want to come and make empty promises. For this project, there is not going to be significant job creation. It is far from the coast and if they mobilise they will mobilise from Cape Town or Saldanha's side. And it's specialised.* *Unfortunately, we cannot give you closure about the gas and the oil and the infrastructure, because it is beyond the scope of this project and it is not yet known what will or will not be obtained. As part of this survey, TGS wants to go and identify the underlying rocks as part of this survey and then other exploration companies such as, for example, Azinam (Eco-Atlantic) can use it to decide where they want to drill to test whether there is oil or gas. The infrastructure can only be planned in possible future production phase. So it would be very irresponsible for me to come and state now what infrastructure there will be if we don't know the details of it.* *About the guarantees, first of all, the first point is that there is only really one fishing industry that is going to be affected. We then also went to make sure that there were feedback mechanisms such as the interaction with the communities, the further research on fish species, the noise monitoring, etc. so that if there is then a red flag that one can then make better decisions.* *Unfortunately, there is not a fixed value about the fishing industry, it will depend to some extent on the source obtained, if so.* **Carissa Saudens** Ek dink nie my vraag is geantwoord nie. Dit gebeur langs ons kus, maar nou kom die manne van die Kaap af en kom doen die werk, dit is onregverdig. Ons wil hê ons dorp moet ontwikkel maar ons soek waarborge. En julle kan nie eers vir ons syfers gee nie. Hoekom het die olie en gas maatskappye nie 10 jaar gelede na ons gemeenskappe toe gekom en vir ons kinders kom opleil om deel te wees van die industrie nie. *I don't think my question has been answered. It's happening along our coasts, but now the people are coming down from the Cape and coming and doing the work, it's unfair. We want our town to evolve but we are looking for guarantees. And you can't even give us figures. Why didn't the oil and gas companies come to our communities 10 years ago and train our children to be part of the industry.* **Dr Kriel** Ons verstaan dat die gemeenskappe desperaat is vir ontwikkeling, maar dit is baie moeilik om op hierdie stadium te kom uitsprake maak oor die moontlike toekomstige waarborge. Hierdie projek is deel van die beplanning van die beplanning van moontlike toekomstige produksie. Dus kan 'n mens nie 'n konkrete nommer gee nie. Die waarborge wat ons op hierdie stadium vir hierdie projek kan gee is dat daar baie strenge maatreëls in plek gestel is om die omgewing te beskerm en dat daar konstante oorsig oor die projek sal wees. As daar dan verder probleme kom is daar die regstelsel waarna julle julle kan wend indien die oorsig nie voldoende is nie. Dit sal fantasties wees as Hondeklipbaai kan ontwikkel – as die olie

Item No	Item
	en gas bedryf dit kan help, fantasties, maar dit kan nie ten koste van die mense en die omgewing gebeur nie. En dus het ons die maatreëls voorgestel en protokolle in plek gestel. *We understand that the communities are desperate for development, but it is very difficult to come to this point to make judgments about the possible future guarantees. This project is part of planning possible future production. Thus, one cannot give a concrete number. The guarantees that we can give for this project at this stage are that very stringent measures have been put in place to protect the environment and that there will be constant oversight of the project. If there are further problems, there is the legal system that you can turn to if the review is not sufficient. It would be fantastic if Hondeklip Bay could develop - if the oil and gas industry can help that, fantastic, but it can't happen at the expense of the people and the environment. And so we proposed the measures and put protocols in place.*
f.	**Patrick Ralph** 'n Mens het nie meer woorde nie. Ons weet dat as hierdie regering besluit het op 'n ding, dan sal hulle dit laat voortgaan, al sit die hele dorp hier en stem nie saam nie. Sê vir die regering dat as die projek voortgaan dat die Oseaan nie meer 'n Oseaan gaan wees nie, maar 'n "Olieaan". My oupa se oupa het vanuit kreef uitgehaal. Toe word daar daar naworsing gedoen en nou is daar permitte ingestel. Dit is 'n onding wat die regering besig is om aan te vang. Ek staar my nie blind aan moontlike werksgeleenthede nie, dit sal nie gebeur nie. Daar word nie van Hondeklipbaai gepraat nie. Ons is net daar om omgeploeg te word. As daar 'n ongeluk met olie gebeur in die toekoms dan kan dit wel hiernatoe kom. Gaan sê vir die regering dat ons ongelukkig is en mag hulle lewensjare verkort word. *You don't have words anymore. We know that if this government decided on a thing, then they would let it continue, even if the whole town sits here and disagrees. Tell the government that if the project goes ahead that the Ocean is no longer going to be an Ocean, but an "Oilean". My grandfather's grandfather took out lobsters for nothing. Then research was carried out and now permits have been put in place. It's a disservice that the government is catching on.* *I'm don't believe we will see, jobs, that won't happen. Hondeklip Bay is not spoken of. We're just there to be plowed over. If an accident happens with oil in the future then it may well come here. Go and tell the government that we are unhappy and may their years of life be shortened.* **Nico Bezuidenhout** Dankie vir u kommentaar. Dit is opgeneem en sal saal met die verslag ingestuur word. *Thanks for your comments. It has been recorded and will be sent in hall with the report.*
g.	**David Marius** Wat het die sosiale studie bevind? *What did the social study find?* **San-Marie Aucamp** San-Marie het uitgebrei oor die bevindinge van die sosiale assessering volgens die verslag. *San-Marie elaborated on the findings of the social assessment as per the report.*

Item No	Item
	Kan ons die link kry na die data-free webtuiste. Mnr Markus het toe stuk aangehaal "With the exception of Florida and Georgia, every governor from Florida to New Hampshire has decided not to allow offshore oil and gas exploration, development and production in the United States Atlantic EEZ". Wat hulle eintlik sê is "dat daar nie eksplorasie in ons land moet plaasvind nie" maar dat hulle internasionaal dit moet gaan doen – buite hulle eie EEZ. Nou kom hulle Mama toe. Die mense wat gaan voordeel trek uit die hele besigheid is nie hier nie, die mense wat sukkel om 'n kreef uit die boot te trek is die mense wat gaan swaarkry. Ons sal moet saam staan en ons sal moet aansoek doen vir ons eie permitte. Moenie praat van die regering nie, ons is die regering. Dit is onverantwoordelik om 'n regering te verkies en dan te wil protes teen die regering. Die fout moet dan by ons gesoek word. Hier is daar nie rules en regulations nie, dis net korrupsie. Moenie 'n situasie aanhits deur hierdie projekte nie. Die wetenskaplikes praat deurmekaar – die tuna het van 2011 tot 2018 heeltemal verdwyn langs die weskus al van Namibië se kant af en dit beweeg nie meer soos dit het nie. Die verslag dui nou aan waar die vis gevang word, maar dit dui nie aan hoe die vorige seismiese opnames die seelewe beinvloed het nie. Die krappe wat nou daar uitkom is nie meer reg nie, hulle is soos mal goed. Ek verwag nie nou 'n antwoord nie, want u is nie 'n marine bioloog nie. Hondeklipbaai se mense – ons moet verstaan dat hierdie ding nie vir ons gaan voordeel het nie. Daar word ook baie gepraat in die naam van ontwikkeling, maar die geskiedenis moet vir ons vertel dat dit nie so gaan wees nie. *Can we get the link to the data-free website.* *Mr Markus then quoted piece "With the exception of Florida and Georgia, every governor from Florida to New Hampshire has decided not to allow offshore oil and gas exploration, development and production in the United States Atlantic EEZ". What they are really saying is "that there should not be exploration in our country" but that they should go and do so internationally – outside of their own EEZ. Now they're coming to this. The people who are going to take advantage of the whole business are not here, the people who are struggling to pull a lobster out of the boat are the people who are going to suffer.* *We will have to stand together and we will have to apply for our own permits. Don't talk about government, we're the government. It is irresponsible to elect a government and then want to protest against the government. The error must then be sought from us. Here there are no rules and regulations, it's just corruption.* *Don't incite a situation through these projects. The scientists talk confused – the tuna completely disappeared along the west coast from Namibia's side from 2011 to 2018 and it is no longer moving as it has. The report now indicates where the fish are caught, but it does not indicate how the previous seismic surveys affected marine life. The crabs that are coming out there now aren't right anymore, they're like crazy stuff. I don't expect an answer right now because you're not a Marine biologist. Hondeklip Bay's people – we have to understand that this thing is not going to benefit us.* *There's also a lot of talk in the name of development, but history has to tell us it's not going to be that way.* San-Marie Ascamp Op hierdie stadium sal die projek van hierdie aard nie veel vir die gemeenskappe inhou nie. Dit is eers in die moontlike volgende fases soos produksie wat die Minerale Hulpbron Wet se vereistes vir sosiale en werkskeppings planne in werking tree. Dit is belangrik om dit in gedagte te hou.

	At this stage, the project of this nature will not provide much for the communities. It is only in the possible next phases such as production that the Mineral Resources Act's requirements for social and job creation plans come into effect. It is important to keep this in mind.
	GP Kriel
	Ons spesialiste het in detail gaan kyk na al die navorsing, of dit nou vir of teen seismiese opnames was of nie. En daar word aanvaar dat in alle navorsing dat daar 'n mate van onsekerheid is, maar dit is belangrik dat daardie onsekerheid so laag as moontlik moet wees om 'n impakbepaling akkuraat te kan maak. Die navorsing is ingesluit tot en met die nuutste inligting van hierdie jaar in sommige gevalle. Daar is impakte, maar ons gevolgtrekking was dat die impakte laag is en dat daar terugvoerings meganismes in plek gestel is.
	Ons erken dat daar korrupsie in ons land is en dat die reëls nie altyd gevolg word nie, maar dit maak dit selfs meer belangrik om seker te maak dat 'n mens maatreëls in plek stel om die omgewing te beskerm ten spyte daarvan.
	Our specialists went into detail to look at all the research, whether it was for or against seismic surveys or not. And it's assumed that in all research that there's some uncertainty, but it's important that that uncertainty needs to be as low as possible to be able to make an impact assessment accurate. The research is included up to and including the latest information from this year in some cases. There are impacts, but our conclusion was that the impacts are low and feedback mechanisms have been put in place.
	We acknowledge that there is corruption in our country and that the rules are not always followed, but it makes it even more important to ensure that one puts measures in place to protect the environment despite it.
L	**Carissa Soudens**
	Eco-Atlantic -Is hulle ook deel van die aansoekers hier? Na hulle hier weg is het ons gaan navorsing doen en wat ons gekry het in Namibië is nie wat Mr Markus genoem het nie. So ons is nou deurmekaar. Ons navorsing het gesê dat die seismiese opnames nie nadelig was vir die visspesies nie.
	Eco-Atlantic – are they part of the applicants here too? After they left here we went to do some research and what we got in Namibia is not what Mr Markus mentioned. So we're confused now. Our research stated that the seismic surveys were not detrimental to the fish species.
	GP Kriel
	Eco-Atlantic is nie deel van die aansoekers vir hierdie projek nie. Soos ek vroeër genoem het, het die Mariene Ekoloog na albei kante van die navorsing gekyk om die dubbelsinnigheid te probeer analiseer. Dit is belangrik om te onthou dat daar navorsing en "navorsing" is. Deesdae het dit maklik geword om 'n armchair navorser te word en gou 'n ding of twee op die Internet raak te lees. Maar dan is daar navorsing wat in 'n wetenskaplike joernaal gepubliseer word wat "peer reviewed". En dan is daar selfs in gepubliseerde joernaal artikels teenstrydige navorsing. As 'n mens wil selektief wees raak dit maklik om enige standpunt uit konteks te neem en dit te probeer regverdig. Dit is hoekom ons na die geheelbeeld en die breër stel navorsing te kyk en soveel as moontlik insluit in ons verslag. Daar is dan ook geleentheid vir publieke deelname sodat ander mense en kundiges hulle menings kan lig en staaf as deel van hierdie proses.
	Eco-Atlantic is not part of the applicants for this project. As I mentioned earlier, the Marine Ecologist looked at both sides of the research to try to analyze the ambiguity. It is important to remember that there is research and "research". Nowadays, it has become easy to become an armchair researcher and

	soon come across a thing or two on the Internet. But then there is research published in a scientific journal that is "peer reviewed". And then even in published journal articles there is conflicting research. If one wants to be selective it becomes easy to take any point of view out of context and try to justify it. This is why we look at the big picture and the broader set of research and include as much as possible in our report. There is also opportunity for public participation so that other people and experts can express and substantiate their opinions as part of this process.
J.	**John Adams** **Is daar 'n verslag oor die mense se besware – dit is ook inligting wat belangrik is vir ons om te oorweeg.** *Is there a report on the people's objections – it is also information that is important for us to consider.* **GP Kriel** **Die publieke deelname verslag met al die kommentaar tot dusver is deel van die verslag wat beskikbaar is op die webtuiste en hier op die dorp. Die kommentaar word net so ingesit.** *The public participation report with all the comments so far is part of the report that is available on the website and here in town. The comments are put in just like that.*

'n Fokus groep vergadering is geskeduleer met die Belanghebbende en Geaffekteerde Partye (I&APs). Die doel van die vergadering was om die terugvoering te gee oor die bevindinge van die Basiese Assesserings Verslag aan lede van die publiek en belangrike I&APs vas te lê. Tydens die vergadering wat tussen 10:00 en 12:00 plaasgevind het, is 'n aanbieding van die projekbeskrywing, voorlopige impakassessering, projekspan en projektydraamwerke aan alle deelnemers van die vergadering deur Environmental Impact Management Services (EIMS) Pty (Ltd) gelewer. 'n Aanbieding is deur mnr GP Kriel van EIMS in Afrikaans gelewer. Nadat die aanbieding afgelewer is, is 'n vraag- en antwoord sessie geopen waar deelnemers vrae gevra het of hul kommentaar oor die projek uitgespreek het. Die bywoningsregister is aangeheg as 'n aanhangsel tot hierdie dokument.

A Focus Group Meeting was scheduled with the Interested and Affected Parties (I&APs). The aim of the meeting was to feedback regarding the findings of the Basic Assessment Report the members of the public and key I&APs. During the public meeting which took place between 10h00 and 12h00, a presentation of the project description, preliminary impact assessment, project team and project timeframes was delivered to all attendees of the meeting by Environmental Impact Management Services (EIMS) Pty (Ltd). A presentation was delivered by Mr GP Kriel from EIMS in Afrikaans. After the presentation was delivered, a question and answer session was opened where attendees asked questions or expressed their comments regarding the project. The attendance register has been attached as an appendix to this document.

Item No	Item
1.	Alle deelnemers is versoek om die bywoningsregister te onderteken soos hulle ingeskryf het. Aanbieding van EIMS van die projekbeskrywing, aansoekproses en omgewingsversagtings tydens seismiese opname is gelewer volgens die agenda hierbo aan die vergaderinggangers. Daar is aangedui dat die vergadering opgeneem sou word vir die doeleindes van akkurate notule neem. Agtergrondinligtingsdokumente (in Engels, Afrikaans en isiXhosa), kommentaarvorms, registrasie, inligtingsuitdeelstukke en bywoningsregisters is by die vergadering beskikbaar gestel. Die deelnemers is aangemoedig om hul kommentaar en bekommernisse in te dien deur die kommentaarvorms in te vul wat verskaf word of deur kommentaar in te dien by die projek-e-posadres wat verskaf is. Daar is opgemerk dat alle deelnemers wat hul kontakbesonderhede verskaf het, by verstek geregistreer sal word op die I&AP-databasis wat deur EIMS gehandhaaf word. Na aanleiding van die aanbiedings is die vloer oopgemaak vir 'n bespreking en die deelnemers is aangemoedig om enige vrae of bekommernisse wat hulle oor die projek gehad het, op te stel. *All attendees were requested to sign the attendance register as they entered. Presentation from EIMS of the project description, application process and environmental mitigations during seismic survey were delivered as per the agenda above to the meeting attendees. It was indicated that the meeting would be recorded for the purposes of accurate minute taking. Background Information Documents (in English, Afrikaans and isiXhosa), comments forms, registration, information handouts and attendance registers, were made available at the meeting.* *The attendees were encouraged to submit their comments and concerns through filling in the comment forms provided or by submitting comments to the project email address provided. It was noted that all attendees who have provided their contact details would be registered by default on the I&AP database maintained by EIMS. Following the presentations, the floor was opened for a discussion and the attendees were encouraged to bring up any questions or concerns they had about the project.*
2.	**Vrae en Antwoorde/ *Questions and Answers***
a.	**Carissa Soudens** Wanneer hulle boor of opnames doen, is daar 'n stelsel wat vir hulle wys waar die vis areas is, sodat hulle kan sien waar die sensitiewe areas is? *When they do drilling or surveying, is there a system that shows them where the fish areas are, so they can see where the sensitive areas are?* **Gif Kriel** Ja hulle is baie bewus van daardie areas en sal al ons inligting hê oor die sensitiewe areas. Hulle sal dan ook die Marine Mammal Observers (MMOs) aan boord hê om hulle te help daarmee, sou dit nodig wees. Hulle sal dan weet waar die sensitiewe areas is en wanneer hulle hulle klankbron kan gebruik en nie. *Yes they are very aware of those areas and will have all our information about the sensitive areas. They will then also have the Marine Mammal Observers (MMOs) on board to help them with that, should it be necessary. They will then know where the sensitive areas are and when they can use their sound source and not.*
b.	**Carissa Soudens**

EIMS

NOTULE VAN VERGADERING/ *MINUTES OF MEETING*

EIMS Verw./ *EIMS Ref*	1520	Projek Naam/ *Project Name*	TGS VERKENNING BA/ *TGS RECONNAISSANCE BA*

Item No	Item
	Ek het my eie impakstudie gedoen en ek stem saam dat daar nie eintlik 'n impak op ons hier langs die kus gaan wees nie. Dit is net belangrik om te kyk dat die visse nie geaffekteer word nie. *I've done my own impact study and I agree that there's not actually going to be an impact on us here along the coast.* **GP Kriel** Dankie vir die kommentaar. Dit is goed om te hoor dat u ook gaan kyk het na die impak van die projek. Ons het na die impak op die visse en ander diere gaan kyk en bepaal dat die impak daarop laag is. *Thanks for the comment. It's good to hear that you also went to look at the impact of the project. We looked at the impact on the fish and other animals and determined that the impact on them was low.*
c.	**GP Kriel** GP Kriel introduced Michael Fayard and requested that Michael provide an overview of TGS and their activities.
d.	**John Ellis** Dit is my verstaan dat daar baie prosesse gevolg moet word en dit is belangrik om seker te maak dat die prosesse reg gedoen word. Ons het Vaalputs hier naby, wat seker 100 km van die kus af gelê is. Is daar enige potensiële impak op Vaalputs van die seismiese opnames in die see? Dit wil voorkom dat daar redelik maatreëls ingebou om die gemeenskap se bekommernisse kan verminder. Ek wil net weet wat bedoel jy met die sin en gees van plek – tong in die kies? *It is my understanding that there are many processes to be followed and it is important to make sure that the processes are done correctly.* *We have Vaalputs nearby, which is probably 100 km from the coast. Is there any potential impact on Vaalputs from the seismic surveys into the ocean?* *It seems that there are reasonable measures built in to reduce the community's concerns.* *I just want to know what do you mean by the sense and spirit of place – tongue in cheek?* **GP Kriel** Daar is baie prosesse, dit is korrek. Die Verkennings Permit aansoek vereis dat 'n omgewings impak studie eers gedoen word en dat die verkennings permit eers goedgekeur kan word indien die bevoegde owerhede omgewingsmagtiging gee. Die versagtings maatreëls word dan in 'n Omgewings bestuursplan geskryf en as dit goedgekeur word, word dit wet vir die uitvoering van die projek, met gevolge as dit nie nagekom word nie en dit word geoudit. Daar is terugvoering aan die departemente en Petroleum Agentskap. Daar is verder ook voorgestel dat daar verdere kommunikasie moet wees tou die projek goedgekeur word om te verseker dat daar deursigtigheid en wedersydse respek aan die plaaslike gemeenskappe gewys word. Vaalputs is ver van die kus af, maar die klankgolwe beweeg ver onder die water, maar die seismiese aktiwiteite is nie energiek genoeg om 'n effek so ver in die binneland te hê nie.

Item No	Item
	Die sin en gees van plek behels die persepsie van hoe 'n mens sy omgewing ervaar en daar is gekyk na hoe 'n projek soos hierdie dalk die plaaslike gemeenskappe se uitkyk en persepsie van hulle omgewing kon beïnvloed. *There are many processes, that is correct. The Scouting Permit application requires that an environmental impact study be conducted first and that the exploration permit can only be approved if the competent authorities give environmental authorisation. The mitigation measures are then written into an Environmental Management Plan and if approved, they become law for the execution of the project, with consequences if they are not met and they are audited. There is feedback to the departments and Petroleum Agency. It was also suggested that there should be further communication should the project be approved to ensure that transparency and mutual respect are shown to the local communities.* *Voelpunts are far from the coast, but the sound waves travel far underwater, but the seismic activity is not energetic enough to have an effect this far inland.* *The sense and spirit of place involved the perception of how one experiences one's environment and looked at how a project such as this might have influenced the local communities' outlook and perception of their surroundings.*
e.	**Richard Petrus (Longtime Nondeklipbaai Fishing Co-op)** Mount Vema is daar naby. Selfs al van ons hier vis, dan kan dit van Mout Vema af kom. Alles is deel van 'n ketting, insluitend die pelagiese. So as die orca en die geelvis en die tuna ens. geaffekteer word, dan gaan dit vir ons affekteer langs die kuslyn af wat afhanklik is van snoek, want dit is die spesies wat pelagiese vis aandrywe. So daar moet seker gemaak word dat Mout Vernon en die ander seamounts goed gekyk word na. *Mount Vema is nearby. Even if some of us fish here, then it can come from Mount Vema. Everything is part of a chain, including the pelagic. So if the orca and the yellowfish and the tuna etc. then it's going to affect us down the coastline that depends on pike, because those are the species that drive pelagic fish. So it needs to be made sure that Mout Vernon and the other seamounts are well looked at.* **GP Kriel** Ons het in redelike detail gaan kyk na daardie areas en die broei en migrasie roetes van die see diere. Die aansoek area is geleë seewaarts van die kontinentale bank. Die meeste van die belangrike prosesse gebeur op of kuswaarts van die kontinentale bank. Daar is wel 'n kans dat daar van die seelewe geaffekteer kan word, en die belangrike ding is om te kyk hoe groot die effek op die seelewe is. Elkeen van die omgewings aspekte het 'n ingeboude herstel vermoë en dit is belangrik om te gaan kyk as deel van so 'n studie, of 'n mens daardie herstel vermoë gaan oorskry of nie. In hierdie geval het ons gevind dat die impakte nie hoë impakte gaan wees nie, maar lae impakte op die mariene omgewing en visserye en dat daar nie 'n "irreplaceable loss of resources" behoort te wees nie. Ons het ook gaan kyk na wetter ander impakte daar huidiglik in die see is en hoe dit tesame met die voorgestelde projek dalk kumulatiewe impakte kan hê. *We looked at those areas in fair detail and the breeding and migration routes of the sea animals. The application area is located seaward of the continental bank. Most of the important processes happen on or off the coast of the continental bank. However, there is a chance that marine life could be affected, and the important thing is to see how great the effect is on marine life. Each of the environmental aspects has a built-in recovery capability and it is important to look as part of such a study, whether or not one is going to exceed that recovery ability. In this case, we found that the impacts are not going to be high impacts but low impacts on the marine environment and fisheries and that there should not be an*

Item No	Item
	"irreplaceable loss of resources". We also looked at what other impacts there are currently in the ocean and how, together with the proposed project, these might have cumulative impacts.
f.	**Richard Petrus** So die seismiese aktiwiteite gaan die (snoek) "runs" verander. Ons het vroeër die jaar dit gevoel. *So the seismic activities are going to change the (sloek) "runs". We felt it earlier in the year.* **dP Kriel** Dit is nie noodwendig die geval nie. Die "runs" gebeur tipies nader aan die kus en die voorgestelde area is ver van die kus af. Daar is ook natuurlike veranderlikheid in die "runs" en daar is 'n groot hoeveelheid aktiwiteite wat langs die weskus gebeur wat ook 'n rol kan speel. Volgens ons spesialiste het ons nie gevind dat die waarskynlikheid van so 'n impak laag is. Ten spyte hiervan het ons voorgestel dat daar aanhoudende navorsing en terugvoering gedoen word oor die moontlike impakte van die seismiese aktiwiteite op die visserye en die migrasie van vis spesies. Ons het ook in ag geneem dat daar dalk van die data onder rapporteer word vir die visserye. Ons het dus voorgestel dat daar strenger maatreëls in plek is om die onsekerheid te kan buffer. *This is not necessarily the case. The "runs" typically happen closer to the coast and the proposed area is far from the coast. There is also natural variability in the "runs" and there is a large amount of activity happening along the west coast that could also play a role. According to our specialists, we did not find that the probability of such an impact is low. Despite this, we suggested that there be ongoing research and feedback on the possible impacts of the seismic activities on fisheries and the migration of fish species. We also took into account that there may be some of the data under report for the fisheries. So we suggested that there be stricter measures in place to be able to buffer the uncertainty.*
g.	**John Ellis** Daar is soveel wyer velde as wat ons in die skole het. In ander provinsies is daar byvoorbeeld oseanografie, en hier by ons is daar nie. Dis die tipe goed wat in die skole sal moet aangespreek word hier. Sodat die kinders kan sien of hulle dalk 'n belangstelling kan hê. *There are so many wider fields than we have in the schools. For example, in other provinces there is oceanography, and here with us there is not. That's the type of stuff that will need to be addressed in the schools here. So the kids can see if they might have an interest.* **Catrina Bastiaanse** Ons het die ander dag voorgestel dat ons kinder bewus gemaak moet word van die tegnologie en dat hulle wiskunde en wetenskap moet hê. *We suggested the other day that our children should be made aware of the technology and that they should have math and science.* **GP Kriel** Ek stem saam. *I agree.*
h.	**Gentleman** Hoe lank is die permit geldig as hulle dit kry? En as hulle dit kry moet hulle weer terugkom gemeenskap toe?

Item No	Item
	How long is the permit valid if they get it? And if they get it they have to come back to the community? **GP Kriel** 'n Verkennings permit is geldig vir 'n jaar en dit kan nie hernu word nie. En hulle moet terugkom gemeenskap toe voor hulle begin. Dit is belangrik om te onthou dat hulle eers omgewings magtiging moet kry voordat hulle 'n verkenningspermit mag kry. En daarna sal die verdere gemeenskap interaksie dan in werking tree. *An exploration permit is valid for a year and cannot be renewed. And they need to get back to the community before they start. It's important to remember that they must first obtain environmental authorization before they are allowed to obtain an exploration permit. And after that, the further community interaction will then take effect.*
4.	**Lionel Pieterson** Het Searcher ook 'n permit aansoek gedoen vir dieselfde area? *Did Searcher also apply for a permit for the same area?* **GP Kriel** Hulle het ook aansoek gedoen, maar daar is verskille in hulle aansoek areas, so die twee aansoek is verskillend van mekaar. Ons verstaan dat dit slegs een van die maatskappye gaan wees wat die opname doen. Ons het egter ook voorgestel dat hulle nie op dieselfde tyd in die water op dieselfde plek kan opnames doen nie. *They also applied, but there are differences in their application areas, so the two applications are different from each other. We understand that it's only going to be one of the companies doing the survey. However, we also suggested that they could not conduct surveys in the water at the same location at the same time.*
5.	**Carista Soudant** Was Searcher nie onlangs in die hof nie? *Wasn't Searcher in court recently?* **GP Kriel** Ja hulle was. Met die vorige aansoek het hulle goedkeuring gekry onder die Minerale Hulpbronnwet. Met hulle aansoek nou en met hierdie aansoek ook, word daar aansoek gedoen onder die Omgewings Bestuur Wet. Die hof het bevind dat hulle aan sekere dinge nie voldoen het nie. *Yes, they were. On the previous application, they received approval under the Mineral Resources Act. With their application old and with this application as well, an application is made under the Environmental Management Act. The court found that they did not comply with certain things.*

'n Openbare vergadering is geskeduleer met die Belanghebbende en Geaffekteerde Partye (I&APs). Die doel van die vergadering was om die terugvoering te gee oor die bevindinge van die Basiese Assesserings Verslag aan lede van die publiek en belangrike I&APs vas te lê. Tydens die openbare vergadering wat tussen 16:00 en 18:00 plaasgevind het, is 'n aanbieding van die projekbeskrywing, voorlopige impakassessering, projekspan en projektydraamwerke aan alle deelnemers van die vergadering deur Environmental Impact Management Services (EIMS) Pty (Ltd) gelewer. 'n Aanbieding is deur mnr GP Kriel van EIMS in Afrikaans gelewer. Nadat die aanbieding afgelewer is, is 'n vraag- en antwoord sessie geopen waar deelnemers vrae gevra het of hul kommentaar oor die projek uitgespreek het. Die bywoningsregister is aangeheg as 'n aanhangsel tot hierdie dokument.

A Public Meeting was scheduled with the Interested and Affected Parties (I&APs). The aim of the meeting was to feedback regarding the findings of the Basic Assessment Report the members of the public and key I&APs. During the public meeting which took place between 16h00 and 18h00, a presentation of the project description, preliminary impact assessment, project team and project timeframes was delivered to all attendees of the meeting by Environmental Impact Management Services (EIMS) Pty (Ltd). A presentation was delivered by Mr GP Kriel from EIMS in Afrikaans. After the presentation was delivered, a question and answer session was opened where attendees asked questions or expressed their comments regarding the project. The attendance register has been attached as an appendix to this document.

1.	Alle deelnemers is versoek om die bywoningsregister te onderteken soos hulle ingeskryf het. Aanbieding van EIMS van die projekbeskrywing, aansoekproses en omgewingsversagtings tydens seismiese opname is gelewer volgens die agenda hierbo aan die vergaderinggangers. Daar is aangedui dat die vergadering opgeneem sou word vir die doeleindes van akkurate notule neem. Agtergrondinligtingsdokumente (in Engels, Afrikaans en isiKhosa), kommentaarvorms, registrasie, inligtingsuitdeelstukke en bywoningsregisters is by die vergadering beskikbaar gestel. Die deelnemers is aangemoedig om hul kommentaar en bekommernisse in te dien deur die kommentaarvorms in te vul wat verskaf word of deur kommentaar in te dien by die projek-e-posadres wat verskaf is. Daar is opgemerk dat alle deelnemers wat hul kontakbesonderhede verskaf het, by verstek geregistreer sal word op die I&AP-databasis wat deur EIMS gehandhaaf word. Na aanleiding van die aanbiedings is die vloer oopgemaak vir 'n bespreking en die deelnemers is aangemoedig om enige vrae of bekommernisse wat hulle oor die projek gehad het, op te stel. *All attendees were requested to sign the attendance register as they entered. Presentation from EIMS of the project description, application process and environmental mitigations during seismic survey were delivered as per the agenda above to the meeting attendees. It was indicated that the meeting would be recorded for the purposes of accurate minute taking. Background Information Documents (in English, Afrikaans and isiXhosa), comments forms, registration, information handouts and attendance registers, were made available at the meeting.* *The attendees were encouraged to submit their comments and concerns through filling in the comment forms provided or by submitting comments to the project email address provided. It was noted that all attendees who have provided their contact details would be registered by default on the I&AP database maintained by EIMS. Following the presentations, the floor was opened for a discussion and the attendees were encouraged to bring up any questions or concerns they had about the project.*
2.	**Vraag en Antwoord/ *Questions and Answers***
a.	**John Van Der Heever** Wat is die sekuriteit faktore wat betrokke is, want waar Amerika betrokke is gaan daar moeilikheid wees en daar kan dalk terrorisme wees. Gaan die weermag of die vloot beskerming bied. Daar is byvoorbeeld baie geld op die skip, bv. R1 miljoen dollars. Daar kan terrorisme van enige kant af kom. *What are the security factors involved, because where America is concerned there is going to be trouble and there might be terrorism. Is going to give protection to the Army or the Navy. For example, there is a lot of money on the ship, e. R1 million dollars. There can be terrorism coming from either side.* **GP Kriel** Die aansoek area is binne Suid-Afrika se waters en dus sal die Suid-Afrikaanse vloot ens verantwoordelik wees om dit te patrolleer. *The application area is within South Africa's waters and thus the South African Navy etc. will be responsible for patrolling it.* **Michael Fayard (TGS)** 'n Hele interne beoordeling word gedoen oor die sekuriteitkwessies, en as daar 'n risiko vir aanvalle is, werk ons saam met die plaaslike vloot of sekuriteitsmaatskappye, en daar is ook addisionele

Item No	Item
	ondersteuningsvaartuig. Suid-Afrika word gesien as 'n laerisikoland en behoort nie 'n groot probleem te hê nie. Ons hou altyd die plaaslike vloot op hoogte van ons bewegings. *A whole internal assessment is done of the security issues, and if there is a risk of attacs then we work with the local navy or security companies, and there is also additional support vessel. South Africa is seen as a low risk country and should not have a big issue. We always keep the local navies informed of our movements.*
b.	**Chief Regan** Hoe ver is die aansoek area van die land af? En hoe ver trek die klank van die boot af? Van ons kant af, maak ons sonar die visse se koppe deurmekaar. Ons is nie teen projekte nie, maar nou kom julle na ons toe. Vandat hulle lank gelede begin het met die surveys vir olie en gas en nou is daar nie meer visse oor nie. Dit is vir ons onaanvaarbaar dat julle nou na die gemeenskappe toe kom en kom verduidelik, waar julle in die eerste plek met ons moes kom gesels het en toestemming gevra het om die studies te doen. *How far is the application area from the country? And how far does the sound travel from the boat? From our side, our sonar messes up the fish's heads. We are not against projects, but now you are coming to us. Ever since they started with the oil and gas surveys a long time ago and now there are no more fish left. It is unacceptable to us that you now come to the communities and explain, where you should have come and talked to us in the first place and asked permission to do the studies.* **GP Kriel** Die klank kan gehoor word op 'n groot afstand partykeer op 'n paar honderd kilometer. Ons het gaan kyk in ons klank studies na die Threshold shifts (dit is die klank waar daar skade of mortaliteit aan die seelewe kan veroorsaak, of afwykinggedrag veroorsaak). Die maksimum afstand wat die seelewe se threshold shifts gaan veroorsaak, is ongeveer 3.5 km. Ons verstaan dat daar beter gedoen kan word oor die algemeen om met die inheemse en tradisionele mense te konsulteer. Ons het dit as deel van ons proses identifiseer en ons het dus maatreëls in plek gestel om seker te maak dat die konsultasie wat hieruit vloei dit in ag neem. Ons het verder voorgestel dat die navorsing wat gedoen word, die plaaslike gemeenskappe moet betrek. *The sound can be heard at a great distance sometimes at a few hundred kilometers. We looked in our audio studies at the Threshold shifts (which is the sound where there can cause damage or mortality to marine life, or cause deviation behavior). The maximum distance that marine life's threshold shifts will cause is about 3.5 km. We understand that better can be done generally to consult with the indigenous and traditional people. We have identified this as part of our process and we have therefore put measures in place to make sure that the consultation that flows from this takes that into account. We further suggested that the research being done should involve the local communities.*
c.	**George Lanes** Ek is ook 'n visserman. Dolfyne en walvisse maak klanke, maak 'n tuna ook 'n klank of 'n kingklip? En met die klimaatsverandering het die vis nie 'n gereelde kringloop nie. *I'm also a fisherman. Dolphins and whales make sounds, does a tuna also make a sound or a kingklip? And with the climate change, the fish do not have a regular cycle.* **GP Kriel** Daar is allerhande dinge wat 'n invloed op visse se gedrag, ens. kan hê. En ons verstaan dat die klank nie net by die aansoek area bly nie. Dit is waardevol dat ons van die gemeenskappe kan hoor oor die verspreiding van die visspesies. Ons het ons best probeer om die karakteristieke van die area in ag te

Item No	Item
	neem en seker te maak dat ons die omgewing soveel as moontlik te beskerm. Rudian Baily het bevestig dat die PAM nie die visse kan optel nie, maar hoofsaaklik net die walvisse en die dolfyne. *There are all sorts of things that affect fish's behavior, etc. can have. And we understand that the sound remains not only with the application area. It is valuable that we can hear from the communities about the distribution of the fish species. We tried our best to consider the characteristics of the area and make sure that we could protect the environment as much as possible. Rudian Baily confirmed that the PAM cannot pick up the fish, but mainly only the whales and the dolphins.*
d.	**Basie Shoshole** Ek het nie 'n vraag nie. Ek wil vir julle sê dat ons nie seismic surveys hier soek nie. Julle kom verduidelik vir ons met mooi voorstelle en goed wat geleerde manse gesê het, maar ons ken ons waters en ons weet dat ons vispesies baie sensitief is. Die vispesies wat hier by ons was het weggetrek as gevolg van die versteurings in die see hier naby die hawe. Julle gaan ons seelewe uitroei. Mnr van der Heever hoef nie bekommerd te wees te wees oor die terroris wat van buite kom nie, die terroris sit langs hom en hy gaan ons voedsel sekuriteit affekteer. Wat hulle wil kom doen hier is teenstrydig met hoe ons al vir eeue ons bron bestuur. Ons voorouers het geweet hoe om die bron te bestuur. Die land is in 'n gemors omdat die tegnologie van buite gekom het. Ons voorouers het tradisioneel gelewe en almal was gelukkig en die mag van geld maak dat ons moet baklei vir alles wat ons het. Ons soek nie die goed in ons see nie. 'n Vesserman sal nooit aard in ander werke wees nie. Daar gaan dan ook niks vir ons kinders iets kom uit hierdie projek nie. Die manse is besig om ons dood te maak. *I don't have a question. I want to tell you that we are not looking for seismic surveys here. You come and explain to us with nice suggestions and stuff learned people have said, but we know our waters and we know that our fish species are very sensitive. The fish species that were here with us moved away because of the disturbances in the sea near the harbour. You're going to eradicate our marine life. Mr van der Heever doesn't have to worry about the terrorist coming from outside, the terrorist is sitting next to him and he's going to affect our food security. What they want to come and do here is inconsistent with how we have been managing our source for centuries. Our ancestors knew how to manage the resource. The country is in a mess because the technology has come from outside. Our ancestors lived traditionally and everyone was happy and the power of money makes us have to fight for everything we have. We don't look for the stuff in our sea. A fisherman will never be kind to other works. There's not going to be anything coming out of this project for our kids either. The people are killing us.* **Nico Bezuidenhout/ GP Kriel** Ons het die kommentaar opgeneem en sal u teenkanting teen die projek notuer. Ons kyk na 'n breër prentjie en die idee is nie om 'n groep manse uit te wis nie. Die idee it om seker te maak dat die manse kans gegee word om hulle insae te lewer, en dit is belangrik, sou daar toekomstige eksplorasie of produktie wees, dat die gemeenskappe moet deelneem aan die prosesse en die maatskappye verantwoordelik hou. *We have incorporated the comments and will note your opposition to the project. We are looking at a broader picture and the idea is not to wipe out a group of people. The idea is to make sure that the people are given a chance to deliver their perusal, and importantly, should there be future exploration or production, that the communities should participate in the processes and hold the companies accountable.*

Item No	Item
	Groot geraas gaan baie steuring veroorsaak en as 'n oud-bewerings spesialis weet ek wat die impak op die seelewe is. Ons het 'n kort snoek seisoen gehad. Ons sien groot probleme vir ons want ons weet daar is niks in plek gesit vir ons as daar dalk iets verkeerd gaan. Ek het vir Robin gevra van Searcher in Houtbaai is daar enige uitkoms? En hy het gesê dat ongelukkig het die owerhede die laaste sê hieroor. Hoekom ons waters kom ploeg en nie daar gaan werk waar hulle vandaan kom nie? Die inheemse gemeenskappe daar oorsee is heeltemal gekant teen olie en gas. Ons moet opstaan teen die besluite van die regering wat ons lewens wil kom benadeel. *Loud noise is going to cause a lot of disturbance and as an ex-conservation specialist I know what the impact is on marine life. We had a short pike season. We see big problems for us because we know there is nothing put in place for us if something goes wrong. I asked Robin from Searcher in Hout Bay is there any outcome? And he said that unfortunately, the authorities have the final say on this. Why come and plow our waters and not work there where they come from? The indigenous communities there overseas are totally opposed to oil and gas. We must stand up against the decisions of the government that want to come and harm our lives.* **GP Kriel** GP het die appèl proses verduidelik. *GP explained the appeal process.*
f.	**Beverly Schalk** Die ding gaan gebeur maak nie saak wat ons sê nie. Gwede Mantashe het dit self bevestig. Hoe pak julle so iets aan en julle gesels nie met die gemeenskappe nie? Ons kan nie met die projekte kom wat niks vir die gemeenskappe het nie. Ons het nou weer 'n kort snoek seisoen gehad van 2 weke waar ons gewoonlik 3 maande het. Die kreef is ook gesmy. As die snoek seisoen begin is daar manne wat werk saam met die vissermanne. Ons wil vra dat julle dit in ag neem. Ons het 'n groot bekommernis hieroor. Ons het gesien wat met die myne gebeur het nie. Moet ons dan nou weer na die uiterste toe gaan om ons waters te beskerm? *The thing is going to happen no matter what we say. Gwede Mantashe himself confirmed this. How do you tackle something like this and you don't talk to the communities? We can't come up with the projects that have nothing for the communities. We have now had another short pike season of 2 weeks where we usually have 3 months. The crayfish were also cut. When the pike season starts there are people working with the fishermen. We want to ask that you take this into account. We have a major concern about this. We saw what happened to the mines. Should we now go back to the extreme to protect our waters?* **Nico Benuidenhout/ GP Kriel** Ons neem kennis van u kommentaar. Dankie. *We note your comments. Thank you.*
g.	**George Lenee** Het julle sosiale studies gedoen om te kyk na die sosiale omgewing en die verslawings, ens. Ons het groot werkloosheid en wil julle nou kom sê dat die projek vir ons niks nie. Ons is bang dat julle ons visse gaan wegjaag. Julle moet eers die dorp leer ken. Het julle 'n vyf jaar studie gaan doen oor die visserye en kan julle vir ons sê hoe dit ons gaan beïnvloed?

	Did you guys do social studies to look at the social environment and the addictions, etc. We have huge unemployment and want to come and tell you now that the project is nothing to us. We're afraid you're going to chase our fish away. You have to get to know the town first. Did you guys do a five-year study on the fisheries and can you tell us how it's going to affect us? **Sam-Marie Aucamp** Ons het 'n sosiale studie gedoen en met soweel moontlik mense gepraat op elke dorp. Die mense se bekommernisse was dieselfde – gaan dit ons vis affekteer en hoe gaan dit ons voortbestaan beinvloed. So ons 'n detail verslag saamgestel wat die bevindinge bevat soos wat daar hier voorgedra is. Op hierdie stadium sal die projek van hierdie aard nie veel vir die gemeenskappe inhou nie. Dit is eers in die moontlike volgende fases soos produksie wat die Minerale Hulpbron Wet se vereistes vir sosiale en werkskeppings planne in werking tree. Die voordele sal moontlik eers in daardie fases kom. Gaan kyk asseblief na die verslag op die data vrye website om te kyk of julle saam stem met ons bevindinge. Daar word duidelik in ons verslag gestel dat die gemeenskappe teen die projek is en hoekom hulle so voel – hulle is onseker en bekommerd oor die persepsie dat die projek hulle voortgestaan kan beinvloed. *We did a social study and talked to as many people as possible in each village. The people's concerns were the same – is it going to affect our fish and how is it going to affect our survival. So we put together a detail report that contains the findings as recited here. At this point, the project of this nature will not hold much for the communities. It is only in the possible next phases such as production that the Mineral Resources Act's requirements for social and job creation plans come into effect. The benefits may not come until those phases. Please check the report on the data free website to see if you guys agree with our findings. Our report clearly states that the communities are against the project and why they feel this way – they are unsure and concerned about the perception that the project could affect their survival.* **GP Kriel** Ons verstaan dat projekte mense se lewens kan beinvloed en dus het ons dit goedgedink om vir hierdie projek 'n in diepte sosiale studie te doen om dit te probeer uitklaar. Ons het die data van die visserye vir elke industrie en het seker gemaak dat ons die data voorstel vir 'n hele aantal jare en hoe die visse beweeg, waar hulle broei, ens. Daar is duidelik gekyk na die navorsing. Dit is ons werk om sover moontlik te probeer seker maak dat die projek voorstel nie die omgewing of die mense wat daarin woon noemenswaardig beskadig gaan word nie. GP het die impak bepaling proses verduidelik. *We understand that projects can affect people's lives and so we saw fit to do an in depth social study for this project to try to clarify this. We have the data from the fisheries for each industry and have made sure that we represent the data for quite a number of years and how the fish move, where they breed, etc. The research was clearly looked at. It is our job to try to make sure as far as possible that the project proposed will not significantly damage the environment or the people who live in it.* *GP explained the impact determination process.*
h.	**Chief Regan** Is Searcher deel van hierdie aansoek? En is dit oor Total se blok? Voorheen het hulle gesê dat daar projekte en voordele gaan wees. Ons was verlede week in Houtbaai en daar het Total vir ons allerhande dinge belowe. Nou kom se julle vir ons dat daar geen voordele gaan wees nie. So ons as inheemse bevolking kan nie die projek ondersteun nie want daar is te veel lewens en die regering gee ook nie om oor ons nie. Ons kan net sowel die vergadering stop en huis toe gaan.

EIMS Verw./ *EIMS Ref*	1520	Projek Naam/ *Project Name*	TGS VERKENNING BA/ *TGS RECONNAISSANCE BA*

Item No	Item
	Is Searcher part of this application? And is it about Total's block? Previously, they said that there were going to be projects and benefits. We were in Hout Bay last week and there Total promised us all sorts of things. Now you come and tell us that there are not going to be any benefits. So we as indigenous people can't support the project because there are too many lies and the government doesn't care about us either, We might as well stop the meeting and go home. **GP Kriel** Searcher is nie deel van hierdie projek nie. Hulle wil wel oor dieselfde area inligting insamel. Total is deel van die huidige Eerste blok houers. Ons verstaan dat daar soms verwarring kan wees. Maar dit is nie die idee nie. Die idee van 'n proses soos hierdie is om inligting te kom deel en die gemeenskappe 'n kans te kan gee om insae te lewer. Ons erken dat daar dalk buite hierdie proses deur die regering op 'n meer strategiese manier gekyk moet word na olie en gas hulpbronne en veral in ag geneem die kwessies soos ons verbintenis om net-zero te gaan teen 'n seker datum. *Searcher is not part of this project. They do want to gather information about the same area. Total is part of the current license block holders. We understand that sometimes there can be confusion. But that's not the idea. The idea of a process like this is to come and share information and give the communities a chance to provide input. We recognise that outside this process the government may need to look at oil and gas resources in a more strategic way and especially considering the issues such as our commitment to go net-zero by a sure date.* **Sue-Marie Ancarp** Dit is belangrik om te ontou die projekte op verskillende tye is en verskillende regte voor aansoek doen. Dus kan daar dalk ander vereistes en impakte wees (goed en sleg) wat die geleentheid gee om projekte in die gemeenskappe te loots. *It is important to untangle the projects at different times and apply different rights before. So there may be other requirements and impacts (good and bad) that give the opportunity to launch projects in the communities.*
I.	**Fisherman** Ek maak my bestaan op die see en ek is bekommerd oor die seismiese aktiwiteite. Die owerhede is besig om ons aan 'n kapitalistiese sisteem te verkoop. Ons voorvaders het die bron beskerm en dit teen poachers beskerm. Vandat die groot vissersbote ingekom het vang ons nie meer red roman, makriel ens nie. Dit was visse wat naby aan die kus voorgekom het. Ons het ook van 1984 al aardverwarming waargeneem. Nadat dit gebeur het, het ons na 2002 nie weer goeie vangste gehad nie. Die aardverwarming het veroorsaak dat ons nie meer sulke lang seisoene het nie. Wat gaan die effek dan nou wees as julle nog kom met seismiese aktiwiteite. Die regering gee nie vir ons om nie en hulle is besig om ons uit te verkoop. Ons nageslag sal nie weer kan vis vang nie. Vis dra by daartoe dat die wêreld se bevolking nie honger hy nie en dit voorsien proteïene wat baie nodig is. Ons is klaar geaffekteer deur baie goed, soos COVID en aardverwarming en nou nog dit ook. Ons is gekant teen hierdie seismiese aktiwiteite. *I make my living on the ocean and I worry about the seismic activities. The authorities are selling us to a capitalist system. Our ancestors protected the source and protected it from poachers. Ever since the big fishing boats came in we no longer catch red snoek, mackerel etc. These were fish that occurred close to shore.*

Item No	Item
	We have also observed global warming since 1994. After that happened, we didn't have good catches again after 2002. The global warming has caused us to no longer have such long seasons. So what will the effect be now if you are still coming up with seismic activity. The government doesn't care about us and they're selling us out. *Our offspring will not be able to fish again. Fish contributes to the fact that the world's population does not go hungry and it provides protins that are very much needed. We're done affecting a lot of stuff, like COVID and global warming and now that too. We are opposed to these seismic activities.* **Nico Bezuidenhout/ GP Kriel** Ons neem kennis van u sterk teenkanting en kommentaar. Dankie. *We note your strong opposition and comments. Thank you.*
j.	**William Jaap** Ek wil net noem dat daar baie beloftes gemaak is van werk toe hulle beplan het om die hawe dieper te maak nie. Ons kry nie meer kreef hier waar ons probeer van naby. Dieselfde gaan gebeur met die seismiese aktiwiteite, ons nageslag gaan nie meer kan vis vang nie. Julle moet dink wat julle aan ons gaan doen. *I just want to mention that many promises were made of work when they planned to make the port deeper. We no longer get lobsters here where we try at close range. The same is going to happen with the seismic activities, our offspring are not going to be able to fish anymore. You have to think about what you're going to do to us.* **Nico Bezuidenhout/ GP Kriel** Ons neem kennis van u sterk teenkanting en kommentaar. Dankie. *We note your strong opposition and comments. Thank you.*
k.	**John van der Heever** Wat is 120 km omgeskakel in seemyl – 66 seemyl – en wat is die afstand tot die aansoek area van Lambertsbaai af. Ek sal graag wil weet want ek wil weet of ek geaffekteer word. As ek DFFE se reëls oorskry kan ek dalk gaan visvang daar. (GP het bevestig dat dit 108 seemyl van Lambertsbaai af is). Dit behoort nie 'n direkte invloed op my te hê nie, maar dit mag 'n impak hê op van die vispesies wat van verder aftom. *What is 120 km converted to nautical miles – 66 nautical miles – and what is the distance to the application area from Lamberts Bay. I would love to know because I want to know if I am affected. If I exceed DFFE's rules I might be able to go fishing there. (GP confirmed it was 108 nautical miles from Lamberts Bay). It shouldn't have a direct impact on me, but it may have an impact on some of the fish species coming from further afield.*

'n Openbare vergadering is geskeduleer met die Belanghebbende en Geaffekteerde Partye (I&APs). Die doel van die vergadering was om die terugvoering te gee oor die bevindinge van die Basiese Assesserings Verslag aan lede van die publiek en belangrike I&APs vas te lê. Daar het ongelukkig geen mense opgedaag vir die vergadering nie. Die projekspan het gebly tot 11:30 en het toe die vergadering gesluit.

A Public Meeting was scheduled with the Interested and Affected Parties (I&APs). The aim of the meeting was to feedback regarding the findings of the Basic Assessment Report the members of the public and key I&APs. Unfortunately, no people showed up for the meeting. The project team stayed until 11:30 a.m. and then closed the meeting.

MEETING DETAILS

Meeting	1520 Draft BAR Consultation Public Meeting		
Meeting Venue	Hoedjies Bay Hotel, Saldanha Bay	Date	2022/11/03
		Time	16h00-18h00

A Public Meeting was scheduled during the draft BAR phase with the Interested and Affected Parties (I&APs). The aim of the meeting was to present the findings of the draft Basic Assessment Report with the members of the public and key I&APs. During the public meeting which took place between 16h00 and 18h00, a presentation of the project description, description of the receiving environment, results of specialist studies, project team, impact assessment results and project timeframes was delivered to all attendees of the meeting by Environmental Impact Management Services (EIMS) Pty (Ltd). The meeting was facilitated by Mr Nico Bezuidenhoudt (NB). The presentation was delivered by Mr GP Kriel from EIMS in English, with Andiswe Xuma available to translation to isiXhosa where required. The presentation was delivered by Michelle Rosch. After the presentations were delivered, a question-and-answer session was opened where attendees asked questions or expressed their comments regarding the project. The presentation and attendance register have been attached as an appendix to this document.

AGENDA

Item
1. **Opening and welcome** Nico welcomed all in attendance and informed the attendees that if they have specific language preferances other than English then this would be accommodated. General ground rules of the meeting were highlighted and the difference between the TGS survey application.

MINUTES OF MEETING

EIMS Ref	1520	Project Name	TGS RECONNAISSANCE BA

Item
1. Opening and welcome
Nico welcomed all in attendance and informed the attendees that if they have specific language preferences other than English then this would be accommodated. General ground rules of the meeting were highlighted and the difference between the TGS survey application.
The audience were invited to ask questions in any language of preference including English, Afrikaans and isiXhosa.

NOTULE/ *MINUTES*

Item No	Item
1.	*All attendees were requested to sign the attendance register as they entered. Presentations from EIMS and SEICHE of the project description, impact assessment findings and environmental mitigations during seismic survey were delivered as per the agenda above to the meeting attendees. It was indicated that the meeting would be recorded for the purposes of accurate minute taking. Background Information Documents (in English, Afrikaans and isiXhosa), comments forms, registration, information handouts and attendance registers, were made available at the meeting.* *The attendees were encouraged to submit their comments and concerns through filling in the comment forms provided or by submitting comments to the project email address provided. It was noted that all attendees who have provided their contact details would be registered by default on the I&AP database maintained by EIMS. Following the presentations, the floor was opened for a discussion and the attendees were encouraged to bring up any questions or concerns they had about the project.*
2.	**Questions and Answers**
a.	**IAPI – Chief Kevin Maart** Chief Maart commented on the turnout from the community being low and concluded that this was not meaningful public participation because the timing is out of sync. He said that has received the notification and report on 25 October 2022 and has not had enough time to really go through the report. The public participation meetings give an opportunity to engage with the specialists while they are here, but the public has not been given sufficient time to interact with the report so that they can ask meaningful questions and concerns regarding the report. The other thing is that the turnout is very lower than the previous meeting in terms of the fishing community because they are engaged in a 2-day workshop for small-scale fishers, so that's why they are not here as well because they probably wanted to be here as well to hear the summary of the report from the EAP. He indicated that for him, meaningful public participation is in the red at this point. The other thing that he identified is meeting fatigue is taking its toll because they have had a lot of public meetings such as those for TGS, government, Searcher and others, hence a low turnout can be anticipated. In terms of what has been presented so far, Chief Maart said that he has a huge problem with in because most of the time when you (the EAP) report on the impacts, for example on the demersal trawl you said that you don't foresee major impacts. If you look at the small-scale fishers, your assessment there is that there won't be a significant impact. My problem firstly is that most of these findings are based on assumptions and desktop modelling. You actually made mention of Austrelians and acoustic impact noise modelling, I will come to that one later on, but your findings are based on that. That will be a problem because we all know and I've spoken to the other environmental specialist last time, that if he wants to be ethical, then any impact, especially in an ecologically sensitive marine environment is normally a major

	impact. If it is insignificant or low on your scorecard, then that doesn't mean it is insignificant. Any impact on the sensitive marine environment is major and is going to be mostly irreversible. I don't want to take the chance to say yes. I agree with you because those findings are based on desktop modelling and assumptions that I can't attest to and that I can't approve so I have a concern over that. The concern over the cumulative impact is real, and it is still rife, and I still have a huge concern with regards to that. Maybe just to quickly touch on the acoustic impact, it was said that an Australian company was used to do the noise modelling, the fish species that they have in Australia are not the same as the fish we have in our waters so I can't really say that the noise modelling they used is going to be the same for our fish species that we have here. If I just look into the acoustic report, the acoustic impact said the following for example: *"The zones of potential injuries for fish with a swim bladder, for example the snoek, turtles, fish eggs and fish larvae are predicted to be within 80 metres from the noise /array source. However, fish species with swim bladders have higher injury impact thresholds and therefore have smaller zones of potential injuries within 90 metres from the air gun /noise source. I want to reject that source of assumption that is made in terms of the noise impact because we all know that any animal has a higher hearing sensitivity than what we human beings have. So, I have a major problem with those kinds of meters that are indicated there as the area that is a safe zone or not a safe zone. So, what I sense is that there is a lot of sugar coating in these impact reports, but I still have to go through it with a fine comb as I said I didn't have enough time to digest all that information and make a proper assessment but just from a cough I can tell you that I'm not very comfortable.* You have put in mitigation measures, I love that but as I said previously, your PAM technology and MMOs etc, I don't know because by the time your MMOs picks up that there's a mammal in close proximity to the ship, by that time the animal would have picked up the sound (array source) already from thousands of miles away. You also mention that there will be support vessels to communicate with mariners about the seismic activity, yet you can't even inform our fishing community in time about meetings like this, I don't know how it will work with the seismic activity. If you will ever get that message out and how you will get it out to tell them about the seismic activity. I appreciate lastly, that the heritage and social impact is considered to be medium, but I still wanted it to be high actually because we have raised our concerns and I don't want to go into the details of our previous meeting, but I suppose it should be higher. Then lastly, I just want to say that I don't appreciate these meetings at Noordhoekbaai Hotel, far from the community, where half of the community has to take taxis to get to the meeting. If you are serious about public participation, you should consider moving it Dyersberg or another location in ward 1 such as the community centre in Middelpos. **CP Kriel** Thank you very much Chief, we appreciate your comments. We do recognize that the turnout is low, and we would have wanted to see more people attending. We did undertake to notify people as soon as the report became available, there's often a lot of difficulty in arranging these types of meetings so we tried to communicate as much as possible regarding that. We also understand that there are a lot of things happening in this timeframe, so we did try to work around that to make sure it doesn't conflict too much with other meetings. Apologies for that, but this is not the only opportunity for comment, there are other opportunities further down the line, there's also a virtual meeting that we'll have later so that will be held next week Thursday, that's also detailed in the notification that was sent out so please make use of that if you can. If there's a need for us to have a further consultation, we can have a look at that and possibly schedule that. We also do appreciate that there's meeting fatigue, there are multiple processes running at the same time. The constraint that we have is that we are bound by the timeframes of the EIA Regulations, so we tried to stick within that, from the day we submitted the application, it only gave us a certain amount of time to facilitate that so we are trying to make sure that we accommodate as much as possible within that time. Then in terms of the significance of the impacts and how it was measured,

Item No	Item
	so you'll see as with any EIA process, there's a significant review of existing information, we have to understand the background information and look at what was researched before, there can't be a reinventing of the wheel every time we go out to do these studies, especially in the ocean where there is a lot of work that has already been done. There are a lot of surveys that are consistently done, a lot of existing information and research that is up to date and fairly accurate. The opportunity is there to utilize that research so although it might appear that a lot of it is based on Desktop assessment, a lot of it is based on as up to date research as we could find, you'll see that there a lot of refences, some of it is 2022 information. We understand that there are some assumption and limitations, but that is standard, and it is required that we declare that as part of the EIA process. We have a section that specifically deals with assumptions and limitations and that must be taken into consideration by PASA when they make a decision. So, although there was desktop assessment, we are confident of the assessment that was done with high degree, when we rate our impacts, it is according to the standard methodology, and we throw in some additional factors so it's not just the standard methodology. We had a look at things like irreplaceable loss of resources, cumulative impacts assessments, and rating assessment that we do for that. We did build in a lot of conservativeé estimates, we asked our guys to not just be liberal with their assessments but rather to err on the side of caution and to build in a buffer so that we rather rate it to be worse and to take a precautionary principle. For the cumulative impacts, we do realize that there are cumulative impacts and it's not just seismics happening in isolation in the ocean, it's not just mining happening but all these things come together, and we do realize that that is a big concern. The ocean is a noisy and busy place, there are lots of activities happening there. We had a robust discussion regarding the cumulative impacts and the overall consensus was that the cumulative impact would be low. In terms of the noise modelling and the fish species and specifically how that gets addressed, although the guys might have been in Australia and the States as well, they are the ones who do it best. We did try to find the best noise modelling experts, they did use local references to the local fish species, they had a lot of discussions with us about the sensitive areas and where they occur, where the noise would travel to and from and how it would be structured. So, it's not a case of them just applying some random method. We do understand that underwater noise, especially in the ocean, can't be related directly to the noise that you hear on land. It travels a bit faster on land a slower in the ocean and its very dependent on the topography of the ocean floor and what type of currents are in effects so all of that was taken into consideration and we had specific threshold shifts that we had a look at where the fish would be injured. Those are the ones you quoted rightly so, there are certain things but it's important to remember the ocean is a large place and it's not inhabited every time, everywhere with everyone. So, there is a bit of lea weigh in that as well, so 3,5 km for example was the biggest distance where they could see a change in behaviour. So, although the sound might travel further than that, it's a case of where the fish might not react as vociferously as they would to that noise. I can hear the seagull outside, but it doesn't affect me right now, in the same way a whale and other marine animals might there the noise from the array source, it's not a case of them having a major reaction and dying. So, we did try to go quantify with real models, specifically those type of impacts so we can build in some safe zones there. We are not in the business of sugar coating anything, we have been very forth coming about whatever limitations there were and it's not our intention to ensure that TGS gets an authorization, they pay us to do an assessment independently, whether it benefits them or not. If they were to have a signific ant impact on the environment, then we would say so and our reports go out to be scrutinized by the public, so we do not want to hide or sugar coat anything. In terms of the PAM and MMO, Rudian I don't know if you want to provide some input there, I know that there are some animals that don't get directly picked up by the PAM, maybe you can give us some information on how you guys deal with that.

EIMS | ENVIRONMENTAL IMPACT MANAGEMENT SERVICES

MINUTES OF MEETING

EIMS Ref	1520	Project Name	TGS RECONNAISSANCE BA

Item No	Item
	Radim: Introduces himself and mentions that he works as a PAM operator on board. He explained that the equipment only picks up sounds from whales and dolphins on high frequency and low frequency. The PAM system doesn't pick up schools of fish. **Michelle (Seiche):** Introduces herself and mentions that the dolphin species are picked up well in advance of the mitigation zone during the day they use a combination of the PAM as well as visual monitoring, sometimes the animals go quiet for a while so they double their efforts at all times to make sure everything is covered. In terms of the question regarding notification of fisheries, PASA does ensure a 30 notification of fisheries prior to starting a survey. So generally, if Seiche were part of a survey project on a Fisheries Liaison Officer (FLO) level, they would engage with the EAP to get the full stakeholder engagement list from the Basic Assessment process and any other stakeholders post authorisation that notifications are sent out to everyone including fishing companies and corporations. **GP:** The other thing I want to mention as well is that we feel that there are a whole lot of things that need to happen before the survey can start, so auditable mitigation measures that need to be implemented prior to commencement. This won't just be a 30-day notification protocol but there would be community engagement on a broader scale and the communication protocols would have to be developed in conject with the likes of yourself. So, we do understand that in the past, it wasn't done that way, so our intention was to draw a line in the sand and say let's do better. Let's engage with communities, let's get them to be part of the research and part of the feedback loop to make sure it's not just a drop and go exercise, it needs to be consultative and engaging and all that needs to be built in. In terms of the social impacts, San Marie, I don't know if you want to weigh in on how it was done. **San Marie:** So, I think the concern was related to how the social impacts were rated, the kind of rating matrix that we used is based on the standard rating methodology that looks at magnitude and extent and so on, which we have always found is not ideal for rating social impacts but we need to use the same rating for all the impact studies. The challenge is to find a rating system that works for all the various studies, the natural scientific studies tend to focus on the site itself while the social and heritage looks at the surroundings. We would have perhaps wanted to rate some of the impacts a bit higher but we have been limited by rating system that we use and that's not EIMS' fault, you can look at any report, the rating systems are very similar. So that's been a challenge for us from a social perspective for many years. We agree that if something does go wrong, the impact on the communities is quite severe but I think if one does look at the qualitative descriptions of the report , they reflect what the potential impact on the community is to a much closer degree as well as the sentiments of the community about the impacts.
b.	**Siyabulela (Ward Councillor):** Introduced himself and stated that he agrees with the Chief regarding the low turnout of the public in the meeting. Even yesterday there was a similar type of engagement and the attendance was the same. He advised that technology should be used to engage people more, he noted that a link had been circulated for the virtual meeting but is concerned that it might not yield the desired result because the people who are suffering in this country and expect opportunities for such projects may not be able to access it. He contestation received for this project is not from the poor but from the beneficiaries of the previous system who do not want to lose their benefits. I remember when we were discussing issues of Section 25 Expropriation without compensation, people were coming with issues of food security, but you realize that their issue is not really about food security but about who will benefit, because they want to remain in their position of benefit. This issue of oil and gas that you are talking about, we support that the environmental assessment process must be undertaken to make sure that the concerns raised regarding marine animals are addressed. However, we notice that the concern is not really about the animals but it's about who is going to benefit there. You will find that once the government authorizes this project, the same people

	who were contesting the project will be at the forefront of the project. People will pretend to be opposed to the project but it's because they don't see a gap for themselves to benefit, once they get a space to be there, their language will change. Oil and gas are a National concern in South Africa and we are saying government they must speed up the process, if you go to areas such as Middlepos and White City, you will see that the lives of people, people are suffering. People need job opportunities so they can improve their lives. This is the same thing as Eskom, it is suffering because it was never designed to supply electricity for the entire nation but only a minority. Similarly with the ocean, the number of people who are now fishing has increased due to population growth, we didn't used to eat fish up until there was transformation in the country, that has caused increase in demand. Meaning that we are transforming and that's why it seems like the stocks are depleting because more people are using their resource. So, my point of view is that I support this project 100%, we need this project so that we can improve our lives. If all the environmental assessment processes have been done, we support the project. For any other future engagements, communicate with us directly so that we can mobilize the people to attend. **GP Kriel** Thank you for your comments, I just want to lower your expectations just a bit in terms of the job opportunities. This is the first step in a long line of things that need to happen before job opportunities come. So typically, the reconnaissance phase is highly technical and won't have any mass scale job opportunities or none. There is a requirement for them to use local population and business as much as possible during the process but typically that doesn't materialize. There are some potential benefits that could come further down the line and that is usually in the production phase if oil and gas is discovered. Also, the secondary benefit of local economy stimulation of industries such as hospitality and supplies and clinics etc.
c.	Siyabulela (Ward Committee): introduces himself and stated that similar to the councillor, he supports the project 150%, because people in the community are hungry. Ever since there was development in the sea, big ships are going out into the sea for fishing every day. So, all I'm saying is the project must start, if you need support, our people are available. Even the Minister if he has a problem he must come to us, don't waste our time we need that project. Nico stated that the comments are noted, and support appreciated but the PP Process is not about counting votes but making sure the report reflects the views of the different communities.
d.	Enrico: introduced himself and acknowledged his former colleagues Ruslan and Chris and most importantly TGS representative Michael who came all the way from Houston, Texas. He then said he wants to add another 50 to the 150% too make it 200% support for the project because it is really needed. He also expressed his concern that TGS is spending a lot of money on consultants and studies conducted for the survey application and they are entrusting the EAP do a good job. He pleaded with the EAP to bring the meetings to the community halls not nice hotels that are inaccessible to the people. He also stated that he is concerned that there is no money flowing into the communities currently through jobs or business opportunities. He requested that the EAP and TGS investigates how the community can benefit right from the start of the project. There was also talk about the minimal employment opportunities and space for participation from local communities. A simple example, if the seismic vessel comes in from the port of Saldanha, any foreign vessel coming into a South African port must have a local agent for all land related operations. TGS can't pay a supplier directly, they must work through an agent. When push comes to shove, the local companies don't get these opportunities, because the agents work amongst one another and select who must get work. About employment, he requested that TGS does a breakdown of his entire workforce and supplies so that they can see what they can do starting from this seismic survey instead of waiting for benefits in production stage. Word of mouth is better than anything

Item No	Item
	because when you hear from someone in your community who has benefitted from the project, it changes perceptions. Nico stated that the comments are noted and certainly TGS will investigate it. Michael stated that the comments are noted and that TGS wants to engage with communities and local suppliers as much as possible. He agreed with the comment about local agents and challenges associated with that, he acknowledged that it's hard to control it but it is an important aspect. It is in TGS best interest to get local people especially those with experience on board as word of mouth is effective. TGS wants to be able to come back into the communities to work with them and so it is beneficial to create good relations with the community.
e.	IAP (Speaks in Afrikaans): I am sorry, I was born in this community, and played in these waters, that were rich with fish. With the development here, we saw a decline in the fish stocks, I hear the people talking about the fishing community. If you stay in the farm you are interested in sheep and other farm animals. That's the farms, but this town is a fishing community/ area, we can't forget the fishermen. If we start with those oil and gas projects, there is no way the fish will stay here, the fish will disappear. When the fish disappear, the fishing community will also disappear. There are fishing communities, farm communities and people with different work /jobs. I am talking specifically about the fishing community, my question is what will happen to them. GP: Thank you for your comments, if we look at the process, we tried to quantify the social impact on the fishing community and we took it further by getting the Social Impact specialist (San Marie) to investigate how the community operates and how the community feels. It's a very important aspect and that's why we've put in measures to ensure that it's not just a hit and run project but that TGS engages with the communities even after the survey is done to make sure that the fishing community is protected. We really tried to make sure we draw the lines through this report, so we've built in conditions that ensure that there is monitoring done on the impact of the noise on the fish species so that the is a feedback mechanism to protect the fishing communities. This is just the reconnaissance phase at this stage, further along, if there is oil and gas in the future, there are things that could go wrong, we're not saying they can't go wrong but we are assessing the impacts for this phase. Each phase in the oil and gas life cycle is required to have its own EIA. If it gets to production stage, then the Social Impact Assessment will state as such and Social Labour Plans will be required. When you have quantified how much oil or gas resource there is, you are able to have concrete plans on how the project will benefit the community. And those things only happen if it has been determined that there will not be any severe harm on the environment and communities. The second thing is that they will need to have financial provisions in place at that stage, if a spill occurs or a large-scale impact during production, they will have to ensure that they utilize those funds to redress the harm caused. This includes implementation of an oil spill response plan and rehabilitation using the funds that are set aside for that purpose. That is all issues that will be addressed in future EIAs which will probably be more stringent as legislation become updated and climate change becomes more of a reality. An important point of an EIA is to ensure that the views and comments of the fishing community are included in the report and that the communities are protected.
f.	Chief Kevin Alert: The one thing that I have realized in my professional life thus far is that when you drive with your car, you can't stop every time a little dog is barking. We have a fishing community and economy that is sustaining many households. It would be irresponsible to kill off one economy, at the cost of people losing their jobs and losing their sustenance out of the sea, hence my questions were speaking to the report because this seismic activity is going to impact on the fish life. Don't try to downplay what I'm asking because of your ignorance and inability to understand what is happening in that ecosystem. But

Item No	Item
	be as it may, I have a problem because you were there when people were talking about jobs so I don't know why you didn't tell them that there will be no jobs. My assertion is that we need to talk to this specific activity that will have an impact on the environment and our livelihoods. I don't want to be rude but this is the West Coast, the traditional area where the Khoisan people have been living and I want to be very clear on this, I will not go and complain in the Eastern Cape because I'm not from the Eastern Cape. I'm talking about what we see to sustain our livelihood and I don't want people coming here to complain about their issues, we need to talk about this seismic activity that will take place in the sea. I'm talking on behalf of the fishers who are in meeting with Barbara Creecy for a day or so and if they were here, you would hear their concerns about what will happen in the sea, not on land but in the sea. Hence I'm saying I'm driving my car and I don't have to worry about little dogs barking. Ward councillor and committee member complained that the chief's comments were offensive, and that the facilitator should have addressed it but at that time the chief had walked out of the meeting.
4.	**General** Nico thanked everyone for attending and requested that IAPs must please advise if there's anyone who should be consulted or notified during this process.
5.	**Closure** The meeting was closed at 18:15.

EIMS Ref	1520	Project Name	TGS RECONNAISSANCE BA

MEETING DETAILS

Meeting	1520 Draft BAR Consultation Public Meeting		
Meeting Venue	Life Church - Sea Point - Cape Town	Date	2022/11/04
		Time	16h00-18h00

A Public Meeting was scheduled during the draft BAR phase with the Interested and Affected Parties (I&APs). The aim of the meeting was to present the findings of the draft Basic Assessment Report with the members of the public and key I&APs. During the public meeting which took place between 16h00 and 18h00, a presentation of the project description, description of the receiving environment, results of specialist studies, project team, impact assessment results and project timeframes was delivered to all attendees of the meeting by Environmental Impact Management Services (EIMS) Pty (Ltd). The meeting was facilitated by Mr Nico Bezuidenhout (NB). The presentation was delivered by Mr GP Kriel from EIMS in English, with Andiswa Xuma available to translation to isiXhosa where required. SEICHE delivered a presentation on the environmental mitigation carried out during seismic surveys in terms of the Marine Mammal Observer (MMO) and Fishing Liaison Officer (FLO) in English. The presentation was delivered by Michelle Bosch. After the presentations were delivered, a question-and-answer session was opened where attendees asked questions or expressed their comments regarding the project. The presentation and attendance register have been attached as an appendix to this document.

AGENDA

Item
1. **Opening and welcome** Nico welcomed all in attendance and informed the attendees that if they have specific language preferences other than English then this would be accommodated. General ground rules of the meeting were highlighted and the difference between the TGS survey application.
2. ***EIMS Presentation (Attached)*** a. **Introducing the project team** b. **Project Description** c. **Impact Assessment** i. **Marine Ecology** ii. **Fisheries Assessment** iii. **Social Impact Assessment** iv. **Site Sensitivities** d. **Need and Desirability of the Project** e. **Public Participation** f. **Key Mitigation Measures** g. **Way Forward**

EIMS Ref	1520	Project Name	TGS RECONNAISSANCE 8A

Item
1. Opening and welcome Nico welcomed all in attendance and informed the attendees that if they have specific language preferences other than English then this would be accommodated. General ground rules of the meeting were highlighted and the difference between the TGS survey application.
3. *Questions and Answers* The audience were invited to ask questions in any language of preference including English, Afrikaans and isiXhosa.

NOTULE/ *MINUTES*

Item No	Item
1.	*All attendees were requested to sign the attendance register as they entered. Presentations from EIMS of the project description, impact assessment findings and environmental mitigations during seismic survey were delivered as per the agenda above to the meeting attendees. It was indicated that the meeting would be recorded for the purposes of accurate minute taking. Background information Documents (in English, Afrikaans and isiXhosa), comments forms, registration, information handouts and attendance registers, were made available at the meeting.* *The attendees were encouraged to submit their comments and concerns through filling in the comment forms provided or by submitting comments to the project email address provided. It was noted that all attendees who have provided their contact details would be registered by default on the I&AP database maintained by EIMS. Following the presentations, the floor was opened for a discussion and the attendees were encouraged to bring up any questions or concerns they had about the project.*
2.	**Questions and Answers**
a.	**IAP1 -Menke (UCT Student)** **Has it been decided if there's still overlap areas with the two different seismic surveys in the same area.** **GP: As far as we understand, they probably won't go for the same area at the same time. I don't know if (Michael) wants to provide input on the overlap between Searcher and TGS.** **Michael (TGS)** **There will not be two surveys, the survey area for Searcher falls within TGS survey area completely so its very unlikely that both companies are going to get a permit. It will probably be us or Searcher. But just because we get the permit or searcher gets the permit, doesn't mean we will do the survey right away, we would need to have discussions with the various companies such as Total, Azinam etc and get financial backing. The likelihood of two surveys happening out there is slim to none.** **IAP1 -Menke (UCT Student)** **Are the coordinates for the two areas in the report?** **GP: Yes, we've double checked them. There's a fairly basic set in the table and there's a more comprehensive set of coordinates on the map itself. You can plot those and I'm happy to send you the kml file as well.**

MINUTES OF MEETING

EIMS Ref	1520	Project Name	TGS RECONNAISSANCE BA

Item No	Item
	IAP1 -Menka (UCT Student) I'm only asking because I work in Port Nolloth and there are several other developments there and so we're trying to map it all out. How was the meeting in Port Nolloth by the way? **EP:** There were a few people there. Last time they protested quite a bit and if you take a look at the report, you'll see that they didn't even want to sit down last time. At least this time there were about 5 or 6 people, it was a fairly short meeting, and they had a few questions for Rudian and Callen (MMO and PAMO) and not much else. In Hondeklip there was a bit more people, everyone was obviously concerned about impacts, but I do think they understand. We had similar concerns during the initial phase throughout all the other meetings.
b.	**IAP2- Male UCT Student** I have question about the costs, how much has it cost so far to do the research or studies? And how much will be spent in terms of projections. **EP:** So are you asking how much it will cost to do the EIA? I can tell you it's quite expensive. The reason for that is a large portion is specialist studies and specialist costs. For example the social impact assessment was quite a big thing and they spent a lot of time in the communities, talking to people travelling up and down, spending time with us in the meetings making sure all the bases are covered. So its quite an expensive study. Then also the public consultation is quite expensive because you have to book venues and do radio adverts to try and get the message out and all that is expensive. Basically its all to comply with the regulations.
c.	**IAP1 -Menka (UCT Student)** I've got a comment instead of a question. It was mentioned that there would be a study of how the fisheries respond to the seismic surveys. I think one thing that may be interesting coming out of that is there may be a research proposal on how that is going to be done. Would it be possible to include the small-scale fishers because I know one thing, they keep saying that even though the survey area doesn't directly coincide with their boundaries, they are still worried about how the survey will affect the fish species in the area. So that would be interesting to understand that a bit more and tying it back to the small scale fishers. And the use of seismic data for offshore wind turbine, that's something that the small scale fishers feel like we should have transitioned a while ago. So would your company be willing to include the local guys in the process. **EP:** In terms of the research, yes I agree with you, that's something that we proposed, the details of that would need to be refined. Again, like we said, and San-Marie will agree that there's a need to look at the San Code of Research Ethics. Before they can start with their survey operations, they need to go back and design an engagement protocol and interact with the local communities in that research. For instance if small scale fisheries could provide higher resolution data, then there's an opportunity for people like Sarah to say okay lets go and do some research with you, shows us where you fish and lets design a research proposal in conjunction with a local university to get some concrete research done. Then you would be using people from local communities and industry experts and then providing direct and real-time feedback to the communities. So there's lots of ways you can go about it but that's the idea behind it. Similar thing with the noise, you can assess the acoustic levels and background noise in the ocean, we all know the ocean is noisy place, but you have to put a concrete number on it and say before the survey, this is how much the noise was in the ocean.

'n Openbare vergadering is geskeduleer met die Belanghebbende en Geaffekteerde Partye (I&APs). Die doel van die vergadering was om die terugvoering te gee oor die bevindinge van die Basiese Assesserings Verslag aan lede van die publiek en belangrike I&APs was te lê. Daar het ongelukkig geen mense opgedaag vir die vergadering nie, ten spyte van die feit dat EIMS 'n taxi gereël het in om gemeenskapslede van Hangberg aan te ry. Die projekspan het gebly tot 11:30 en het toe die vergadering gesluit.

A Public Meeting was scheduled with the Interested and Affected Parties (I&APs). The aim of the meeting was to feedback regarding the findings of the Basic Assessment Report the members of the public and key I&APs. Unfortunately, no people showed up for the meeting, despite the fact that EIMS arranged a taxi in to drive community members from Hangberg. The project team stayed until 11:30 a.m, and then closed the meeting.

A: Introduction

This Summary for Policymakers (SPM) presents key findings of the Working Group II (WGII) contribution to the Sixth Assessment Report (AR6) of the IPCC[1]. The report builds on the WGII contribution to the Fifth Assessment Report (AR5) of the IPCC, three Special Reports[2], and the Working Group I (WGI) contribution to the AR6 cycle.

This report recognizes the interdependence of climate, ecosystems and biodiversity[3], and human societies (Figure SPM.1) and integrates knowledge more strongly across the natural, ecological, social and economic sciences than earlier IPCC assessments. The assessment of climate change impacts and risks as well as adaptation is set against concurrently unfolding non-climatic global trends e.g., biodiversity loss, overall unsustainable consumption of natural resources, land and ecosystem degradation, rapid urbanisation, human demographic shifts, social and economic inequalities and a pandemic.

The scientific evidence for each key finding is found in the 18 chapters of the underlying report and in the 7 cross-chapter papers as well as the integrated synthesis presented in the Technical Summary (hereafter TS) and referred to in curly brackets {}. Based on scientific understanding, key findings can be formulated as statements of fact or associated with an assessed level of confidence using the IPCC calibrated language[4]. The WGII Global to Regional Atlas (Annex I) facilitates exploration of key synthesis findings across the WGII regions.

The concept of risk is central to all three AR6 Working Groups. A risk framing and the concepts of adaptation, vulnerability, exposure, resilience, equity and justice, and transformation provide alternative, overlapping, complementary, and widely used entry points to the literature assessed in this WGII report.

Across all three AR6 working groups, risk[5] provides a framework for understanding the increasingly severe, interconnected and often irreversible impacts of climate change on ecosystems, biodiversity, and human systems; differing impacts across regions, sectors and communities; and how to best reduce adverse consequences for current and future generations. In the context of climate change, risk can arise from the dynamic interactions among climate-related hazards[6] (see Working Group I), the exposure[7] and vulnerability[8] of affected human and ecological systems. The risk that can be introduced by human responses to climate change is a new aspect considered in the risk concept. This report identifies 127 key risks[9]. {1.3, 16.5}

The vulnerability of exposed human and natural systems is a component of risk, but also, independently, an important focus in the literature. Approaches to analysing and assessing vulnerability have evolved since previous IPCC assessments. Vulnerability is widely understood to differ within communities and across societies, regions and countries, also changing through time.

Adaptation[10] plays a key role in reducing exposure and vulnerability to climate change. Adaptation in ecological systems includes autonomous adjustments through ecological and evolutionary processes. In human systems, adaptation can be anticipatory or reactive, as well as incremental

---

1 Decision IPCC-CRP/51-9, The assessment covers scientific literature accepted for publication by 1 September 2021.

2 The three Special Reports are 'Global Warming of 1.5°C, An IPCC Special Report on the impacts of global warming of 1.5°C above pre-industrial levels and related global greenhouse gas emission pathways, in the context of strengthening the global response to the threat of climate change, sustainable development, and efforts to eradicate poverty (SR1.5)'; 'Climate Change and Land: An IPCC Special Report on climate change, desertification, land degradation, sustainable land management, food security, and greenhouse gas fluxes in terrestrial ecosystems (SRCCL)'; 'IPCC Special Report on the Ocean and Cryosphere in a Changing Climate (SROCC)'.

3 Biodiversity: Biodiversity or biological diversity means the variability among living organisms from all sources including, among other things, terrestrial, marine and other aquatic ecosystems, and the ecological complexes of which they are part; this includes diversity within species, between species, and of ecosystems.

4 Each finding is grounded in an evaluation of underlying evidence and agreement. A level of confidence is expressed using five qualifiers: very low, low, medium, high and very high, and typeset in bold, e.g., **medium confidence**. The following terms have been used to indicate the assessed likelihood of an outcome or a result: virtually certain 99–100% probability, very likely 90–100%, likely 66–100%, as likely as not 33–66%, unlikely 0–33%, very unlikely 0–10%, exceptionally unlikely 0–1%. Assessed likelihood is typeset in bold, e.g., *very likely*. This is consistent with AR5 and the other AR6 reports.

5 Risk is defined as the potential for adverse consequences for human or ecological systems, recognising the diversity of values and objectives associated with such systems.

6 Hazard is defined as the potential occurrence of a natural or human-induced physical event or trend that may cause loss of life, injury, or other health impacts, as well as damage and loss to property, infrastructure, livelihoods, service provision, ecosystems and environmental resources. Physical climate conditions that may be associated with hazards are assessed in Working Group I as climate impact-drivers.

7 Exposure is defined as the presence of people, livelihoods, species or ecosystems, environmental functions, services and resources, infrastructure, or economic, social or cultural assets in places and settings that could be adversely affected.

8 Vulnerability in this report is defined as the propensity or predisposition to be adversely affected and encompasses a variety of concepts and elements including sensitivity or susceptibility to harm and lack of capacity to cope and adapt.

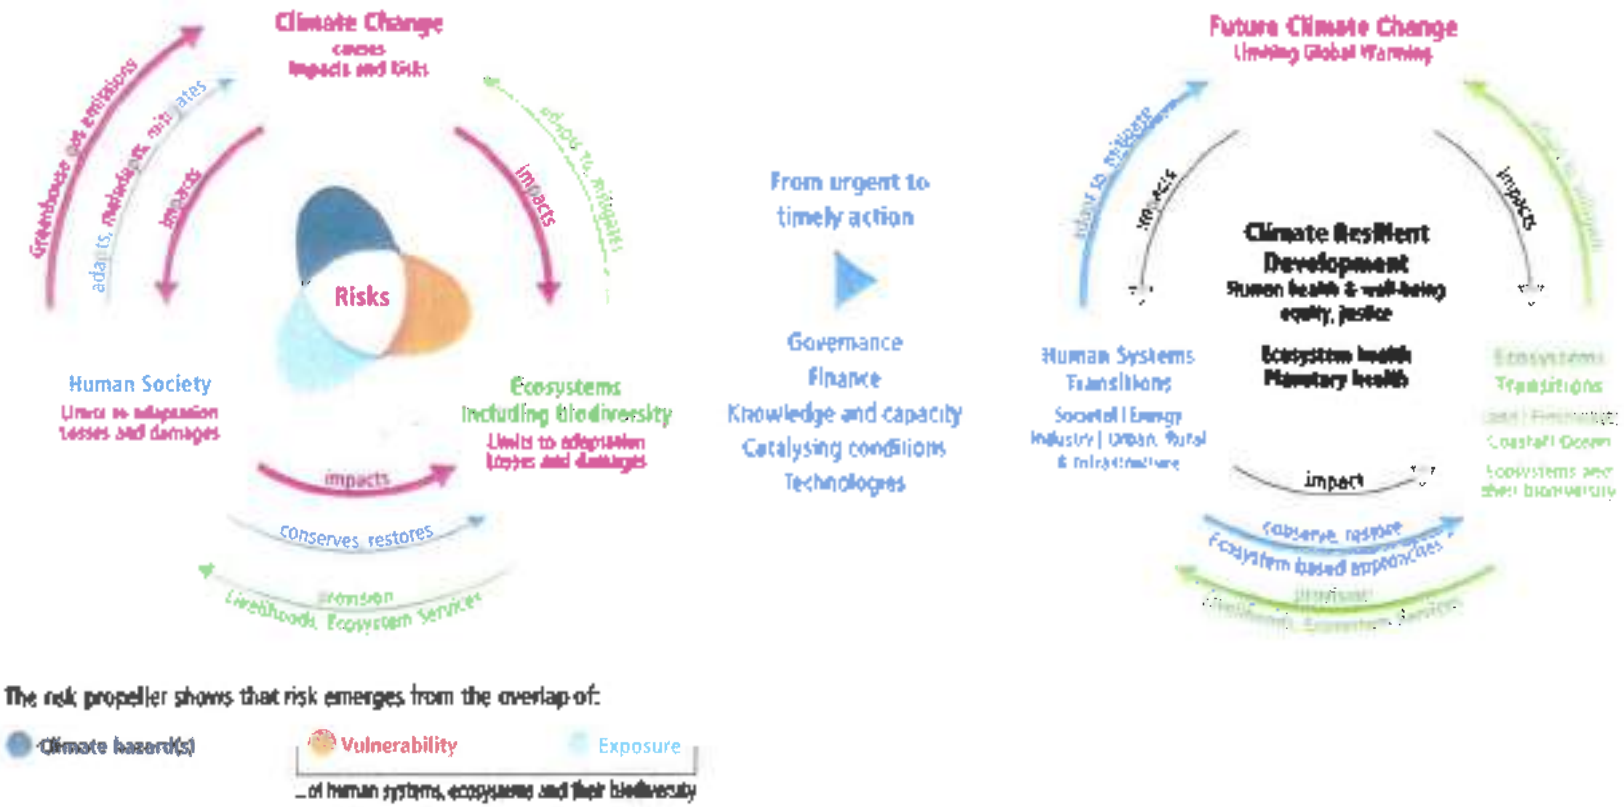
9 Key risks have potentially severe adverse consequences for humans and social-ecological systems, resulting from the interaction of climate-related hazards with vulnerabilities of societies and systems exposed.

10 Adaptation is defined, in human systems, as the process of adjustment to actual or expected climate and its effects, in order to moderate harm or take advantage of beneficial opportunities. In natural systems, adaptation is the process of adjustment to actual climate and its effects; human intervention may facilitate this.

From climate risk to climate resilient development: climate, ecosystems (including biodiversity) and human society as coupled systems

(a) Main interactions and trends

(b) Options to reduce climate risks and establish resilience



The risk propeller shows that risk emerges from the overlap of:

Climate hazard(s) | Vulnerability | Exposure

...of human systems, ecosystems and their biodiversity

Figure SPM.1 | This report has a strong focus on the interactions among the coupled systems climate, ecosystems (including their biodiversity) and human society. These interactions are the basis of emerging risks from climate change, ecosystem degradation and biodiversity loss and, at the same time, offer opportunities for the future.

(a) Human society causes climate change. Climate change, through hazards, exposure and vulnerability generates impacts and risks that can surpass limits to adaptation and result in losses and damages. Human society can adapt to, moderate and mitigate climate change. Ecosystems can adapt and mitigate within limits. Ecosystems and their biodiversity provision livelihoods and ecosystem services. Human society impacts ecosystems and can restore and conserve them.

(b) Meeting the objectives of climate resilient development thereby supporting human, ecosystem and planetary health, as well as human well-being, requires society and ecosystems to move over (transition) to a more resilient state. The recognition of climate risks can strengthen adaptation and mitigation actions and transitions that reduce risks. Taking action is enabled by governance, finance, knowledge and capacity building, technology and catalysing conditions. Transformation entails system transitions strengthening the resilience of ecosystems and society (Section D). In (a) arrow colours represent principle human society interactions (blue), ecosystem (including biodiversity) interactions (green) and the impacts of climate change and human activities, including losses and damages, under continued climate change (red). In (b) arrow colours represent human system interactions (blue), ecosystem (including biodiversity) interactions (green) and reduced impacts from climate change and human activities (grey) (1.2, Figure 1.2, Figure TS. 2)

and/ or transformational. The latter changes the fundamental attributes of a social-ecological system in anticipation of climate change and its impacts. Adaptation is subject to hard and soft limits[11].

Resilience[12] in the literature has a wide range of meanings. Adaptation is often organized around resilience as bouncing back and returning to a previous state after a disturbance. More broadly the term describes not just the ability to maintain essential function, identity and structure, but also the capacity for transformation.

This report recognises the value of diverse forms of knowledge such as scientific, as well as Indigenous knowledge and local knowledge in understanding and evaluating climate adaptation processes and actions to reduce risks from human-induced climate change. AR6 highlights adaptation solutions which are effective, feasible[13], and conform to principles of justice[14]. The term climate justice, while used in different ways in different contexts by different communities, generally includes three principles: *distributive justice* which refers to the allocation of burdens and benefits among individuals, nations and generations; *procedural justice* which refers to who decides and participates in decision-making; and *recognition* which entails basic respect and robust engagement with and fair consideration of diverse cultures and perspectives.

Effectiveness refers to the extent to which an action reduces vulnerability and climate-related risk, increases resilience, and avoids maladaptation[15].

This report has a particular focus on transformation[16] and system transitions in energy; land, ocean, coastal and freshwater ecosystems; urban, rural and infrastructure; and industry and society. These transitions make possible the adaptation required for high levels of human health and well-being, economic and social resilience, ecosystem health[17], and planetary health[18] (Figure SPM.1). These system transitions are also important for achieving the low global warming levels (Working Group III) that would avoid many limits to adaptation[11]. The report also assesses economic and non-economic losses and damages[19]. This report labels the process of implementing mitigation and adaptation together in support of sustainable development for all as climate resilient development[20].

Box SPM.1 | AR6 Common Climate Dimensions, Global Warming Levels and Reference Periods

Assessments of climate risks consider possible future climate change, societal development and responses. This report assesses literature including that based on climate model simulations that are part of the fifth and sixth Coupled Model Intercomparison Project Phase (CMIP5, CMIP6) of the World Climate Research Programme. Future projections are driven by emissions and/or concentrations from Illustrative Representative Concentration Pathways (RCPs)[21] and Shared Socioeconomic Pathways (SSPs)[22] scenarios, respectively[23]. Climate impacts literature is based primarily on climate projections assessed in AR5 or earlier, or assumed global warming levels, though some recent impacts literature uses newer projections based on the CMIP6 exercise. Given differences in the impacts literature regarding

11 Adaptation limits: The point at which an actor's objectives (or system needs) cannot be secured from intolerable risks through adaptive actions.
Hard adaptation limit—no adaptive actions are possible to avoid intolerable risks.
Soft adaptation limit—Options may exist but are currently not available to avoid intolerable risks through adaptive actions.

12 Resilience in this report is defined as the capacity of social, economic and ecosystems to cope with a hazardous event or trend or disturbance, responding or reorganizing in ways that maintain their essential function, identity and structure as well as biodiversity in case of ecosystems while also maintaining the capacity for adaptation, learning and transformation. Resilience is a positive attribute when it maintains such a capacity for adaptation, learning, and/or transformation.

13 Feasibility refers to the potential for an adaptation option to be implemented.

14 Justice is concerned with valuing fair the moral or legal principles of fairness and equity in the way people are treated, often based on the norms and values of society. Social justice comprises fair or fair relations within society that seek to address the distribution of wealth, access to resources, opportunity and support according to principles of justice and fairness. Climate justice considers human rights, development and human rights to achieve a rights-based approach to addressing climate change.

15 Maladaptation refers to actions that may lead to increased risk of adverse climate-related outcomes, including via increased greenhouse gas emissions, increased or shifted vulnerability to climate change, more inequitable outcomes, or diminished welfare, now or in the future. More often, maladaptation is an unintended consequence.

16 Transformation refers to a change in the fundamental attributes of natural and human systems.

17 Ecosystem health: a metaphor used to describe the condition of an ecosystem, by analogy with human health. Note that there is no commonly accepted benchmark for a healthy ecosystem. Rather, the assessed health status of an ecosystem is judged on the ecosystem's resilience to change, with details depending upon which metrics (such as species richness and abundance) are employed in judging it and which societal aspirations are driving the assessment.

18 Planetary health: a concept based on the understanding that human health and human civilization depend on ecosystem health and the wise stewardship of ecosystems.

19 In this report, the term 'losses and damages' refers to observed impacts and/or projected risks and can be economic and/or non-economic.

20 In the WGIII report, climate resilient development refers to the process of implementing greenhouse gas mitigation and adaptation measures to support sustainable development for all.

21 RCP-based scenarios are referred to as RCPy, where 'y' refers to the level of radiative forcing (in watts per square metre, or W/m^2) resulting from the scenario in the year 2100.

22 SSP-based scenarios are referred to as SSPx-y, where 'SSPx' refers to the Shared Socioeconomic Pathway describing the socioeconomic trends underlying the scenarios, and 'y' refers to the level of radiative forcing (in watts per square metre, or W/m^2) resulting from the scenario in the year 2100.

23 IPCC is neutral with regard to the scenarios underlying the SSPs, which do not cover all possible scenarios. Alternative scenarios may be considered or developed.

Box SPM.1 (continued)

socioeconomic details and assumptions, WGII chapters conceptualize impacts with respect to exposure, vulnerability and adaptation as appropriate for their literature, this includes assessments regarding sustainable development and climate resilient development. There are many emissions and socioeconomic pathways that are consistent with a given global warming outcome. These represent a broad range of possibilities as available in the literature assessed that affect future climate change exposure and vulnerability. Where available, WGII also assesses literature that is based on an integrative SSP-RCP framework where climate projections obtained under the RCP scenarios are analysed against the backdrop of various illustrative SSPs[33]. The WGII assessment combines multiple lines of evidence including impacts modelling driven by climate projections, observations, and process understanding. (1.2, 16.5, 18.2, CCB CLIMATE, WGI AR6 SPM.C, WGI AR6 Box SPM.1, WGI AR6 1.6, WGI AR6 12, AR6 WGI)

A common set of reference years and time periods are adopted for assessing climate change and its impacts and risks: the reference period 1850–1900 approximates pre-industrial global surface temperature, and three future reference periods cover the near-term (2021–2040), mid-term (2041–2060) and long-term (2081–2100). (CCB CLIMATE)

Common levels of global warming relative to 1850–1900 are used to conceptualize and facilitate analysis, synthesis and communication of assessed past, present and future climate change impacts and risks considering multiple lines of evidence. Robust geographical patterns of many variables can be identified at a given level of global warming, common to all scenarios considered and independent of timing when the global warming level is reached. (16.5, CCB CLIMATE, WGI AR6 Box SPM.1, WGI AR6 4.2, WGI AR6 CCB11.1)

WGI assessed the increase in global surface temperature is 1.09 [0.95 to 1.20][34] °C in 2011–2020 above 1850–1900. The estimated increase in global surface temperature since AR5 is principally due to further warming since 2003–2012 (+0.19 [0.16 to 0.22] °C).[35] Considering all the illustrative scenarios assessed by WGI, there is at least a greater than 50% likelihood that global warming will reach or exceed 1.5°C in the near-term, even for the very low greenhouse gas emissions scenario[36]. (WGI AR6 SPM A1.2, WGI AR6 SPM B1.3, WGI AR6 Table SPM.1, WGI AR6 CCB 2.3)

B: Observed and Projected Impacts and Risks

Since AR5, the knowledge base on observed and projected impacts and risks generated by climate hazards, exposure and vulnerability has increased with impacts attributed to climate change and key risks identified across the report. Impacts and risks are expressed in terms of their damages, harms, economic, and non-economic losses. Risks from observed vulnerabilities and responses to climate change are highlighted. Risks are projected for the near-term (2021–2040), the mid (2041–2060) and long term (2081–2100), at different global warming levels and for pathways that overshoot 1.5°C global warming level for multiple decades[37]. Complex risks result from multiple climate hazards occurring concurrently, and from multiple risks interacting, compounding overall risk and resulting in risks transmitting through interconnected systems and across regions.

---

34 In the WGI report, square brackets [x to y] are used to provide the assessed *very likely* range, or 90% interval.

35 Since AR5, methodological advances and new datasets have provided a more complete spatial representation of changes in surface temperature, including in the Arctic. These and other improvements have also increased the estimate of global surface temperature change by approximately 0.1°C, but this increase does not represent additional physical warming since AR5.

36 Global warming of 1.5°C relative to 1850–1900 would be exceeded during the 21st century under the intermediate, high and very high greenhouse gas emissions scenarios considered in this report (SSP2-4.5, SSP3-7.0 and SSP5-8.5, respectively). Under the five illustrative scenarios, in the near-term (2021–2040), the 1.5°C global warming level is *very likely* to be exceeded under the very high greenhouse gas emissions scenario (SSP5-8.5), *likely* to be exceeded under the intermediate and high greenhouse gas emissions scenarios (SSP2-4.5 and SSP3-7.0), *more likely than not* to be exceeded under the low greenhouse gas emissions scenario (SSP1-2.6) and *more likely than not* to be reached under the very low greenhouse gas emissions scenario (SSP1-1.9). Furthermore, for the very low greenhouse gas emissions scenario (SSP1-1.9), it is *more likely than not* that global surface temperature would decline back to below 1.5°C toward the end of the 21st century, with a temporary overshoot of no more than 0.1°C above 1.5°C global warming.

37 Overshoot in this report, pathways that first exceed a specified global warming level (usually 1.5°C, by more than 0.1°C), and then return to or below that level again before the end of a specified period of time (e.g., before 2100). Sometimes the magnitude and likelihood of the overshoot is also characterized. The overshoot duration can vary from at least one decade up to several centuries.

SPM

Observed Impacts from Climate Change

B.1 Human-induced climate change, including more frequent and intense extreme events, has caused widespread adverse impacts and related losses and damages to nature and people, beyond natural climate variability. Some development and adaptation efforts have reduced vulnerability. Across sectors and regions the most vulnerable people and systems are observed to be disproportionately affected. The rise in weather and climate extremes has led to some irreversible impacts as natural and human systems are pushed beyond their ability to adapt. *(high confidence)* (Figure SPM.2) [TS B.1, Figure TS.5, 1.3, 2.3, 2.4, 2.6, 3.3, 3.4, 3.5, 4.2, 4.3, 5.2, 5.12, 6.2, 7.2, 8.2, 9.6, 9.8, 9.10, 9.11, 10.4, 11.3, 12.3, 12.4, 13.10, 14.4, 14.5, 15.3, 16.2, CCP1.2, CCP3.2, CCP4.1, CCP5.2, CCP6.2, CCP7.2, CCP7.3, CCB DISASTER, CCB EXTREMES, CCB ILLNESS, CCB MIGRATE, CCB NATURAL, CCB SLR]

B.1.1 Widespread, pervasive impacts to ecosystems, people, settlements, and infrastructure have resulted from observed increases in the frequency and intensity of climate and weather extremes, including hot extremes on land and in the ocean, heavy precipitation events, drought and fire weather *(high confidence)*. Increasingly since AR5, these observed impacts have been attributed[24] to human-induced climate change particularly through increased frequency and severity of extreme events. These include increased heat-related human mortality *(medium confidence)*, warm-water coral bleaching and mortality *(high confidence)*, and increased drought-related tree mortality *(high confidence)*. Observed increases in areas burned by wildfires have been attributed to human-induced climate change in some regions *(medium to high confidence)*. Adverse impacts from tropical cyclones, with related losses and damages[11], have increased due to sea level rise and the increase in heavy precipitation *(medium confidence)*. Impacts in natural and human systems from slow-onset processes[25] such as ocean acidification, sea level rise or regional decreases in precipitation have also been attributed to human induced climate change *(high confidence)*. [1.3, 2.3, 2.4, 2.5, 3.2, 3.4, 3.5, 3.6, 4.2, 5.2, 5.4, 5.6, 5.12, 7.2, 9.6, 9.7, 9.8, 9.11, 11.3, Box 11.1, Box 11.2, Table 11.9, 12.3, 12.4, 13.3, 13.5, 13.10, 14.2, 14.3, 15.7, 15.8, 16.2, CCP1.2, CCP2.2, Box CCP5.1, CCP7.3, CCB DISASTER, CCB EXTREME, CCB ILLNESS, WGI AR6 SPM.3, WGI AR6 9, WGI AR6 11.3–11.8, SROCC Chapter 4]

B.1.2 Climate change has caused substantial damages, and increasingly irreversible losses, in terrestrial, freshwater and coastal and open ocean marine ecosystems *(high confidence)*. The extent and magnitude of climate change impacts are larger than estimated in previous assessments *(high confidence)*. Widespread deterioration of ecosystem structure and function, resilience and natural adaptive capacity, as well as shifts in seasonal timing have occurred due to climate change *(high confidence)*, with adverse socioeconomic consequences *(high confidence)*. Approximately half of the species assessed globally have shifted poleward or, on land, also to higher elevations *(very high confidence)*. Hundreds of local losses of species have been driven by increases in the magnitude of heat extremes *(high confidence)*, as well as mass mortality events on land and in the ocean *(very high confidence)* and loss of kelp forests *(high confidence)*. Some losses are already irreversible, such as the first species extinctions driven by climate change *(medium confidence)*. Other impacts are approaching irreversibility such as the impacts of hydrological changes resulting from the retreat of glaciers, or the changes in some mountain *(medium confidence)* and Arctic ecosystems driven by permafrost thaw *(high confidence)*. (Figure SPM.2a). [TS B.1, Figure TS.5, 2.3, 2.4, 3.4, 3.5, 4.2, 4.3, 4.5, 9.6, 10.4, 11.3, 12.3, 12.8, 13.3, 13.4, 13.10, 14.4, 14.5, 14.6, 15.3, 16.2, CCP1.2, CCP3.2, CCP4.1, CCP5.2, Figure CCP5.4, CCP6.1, CCP6.2, CCP7.2, CCP7.3, CCB EXTREMES, CCB ILLNESS, CCB MOVING PLATE, CCB NATURAL, CCB PALEO, CCB SLR, SROCC 2.3]

B.1.3 Climate change including increases in frequency and intensity of extremes have reduced food and water security, hindering efforts to meet Sustainable Development Goals *(high confidence)*. Although overall agricultural productivity has increased, climate change has slowed this growth over the past 50 years globally *(medium confidence)*, related negative impacts were mainly in mid- and low latitude regions but positive impacts occurred in some high latitude regions *(high confidence)*. Ocean warming and ocean acidification have adversely affected food production from shellfish aquaculture and fisheries in some oceanic regions *(high confidence)*. Increasing weather and climate extreme events have exposed millions of people to acute food insecurity[26] and reduced water security, with the largest impacts observed in many local areas and/or communities in Africa, Asia, Central and South America, Small Islands and the Arctic *(high confidence)*. Jointly, sudden losses of food production and access to food compounded by decreased diet diversity have increased malnutrition in many communities *(high confidence)*, especially for Indigenous Peoples, small-scale food producers and low-income households *(high confidence)*, with children, elderly people and pregnant women particularly impacted *(high confidence)*. Roughly half of the world's population currently experience severe water scarcity for at least some part of the year due to climatic and non-climatic drivers *(medium confidence)*. [Figure SPM.2b] [3.5, 4.3, 4.4, Box 4.1, 5.2, 5.4, 5.8, 5.9, 5.12, 7.1, 7.2, 9.8, 10.4, 11.3, 12.3, 13.5, 14.4, 14.5, 15.3, 16.2, CCP5.2, CCP6.2]

---

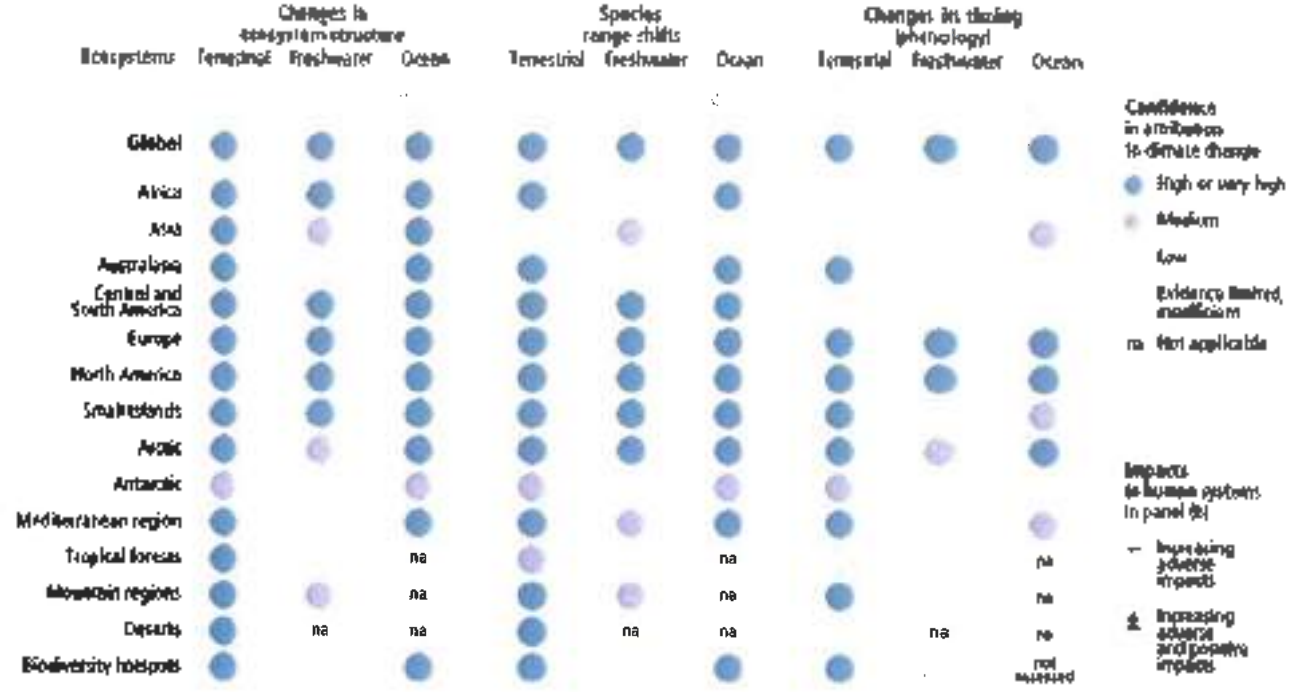
24 Attribution is defined as the process of evaluating the relative contributions of multiple causal factors to a change or event with an assessment of confidence [Annex II Glossary, CHAP EXTRA]

25 Impacts of climate change are caused by slow onset and extreme events. Slow onset events are described among the climate-related drivers of the WGII AR6 and refer to the risks and impacts associated with e.g. increasing temperature means, desertification, decreasing precipitation, loss of biodiversity, land and forest degradation, glacier retreat and related impacts, ocean acidification, sea level rise and salinization [https://interactive-atlas.ipcc.ch].

26 Acute food insecurity can occur at any time with a severity that threatens lives, livelihoods or both, regardless of the causes, context or duration, as a result of shocks-driving determinants of food security and nutrition, and used to assess the need for humanitarian action.

Impacts of climate change are observed in many ecosystems and human systems worldwide

(a) Observed impacts of climate change on ecosystems



(b) Observed impacts of climate change on human systems

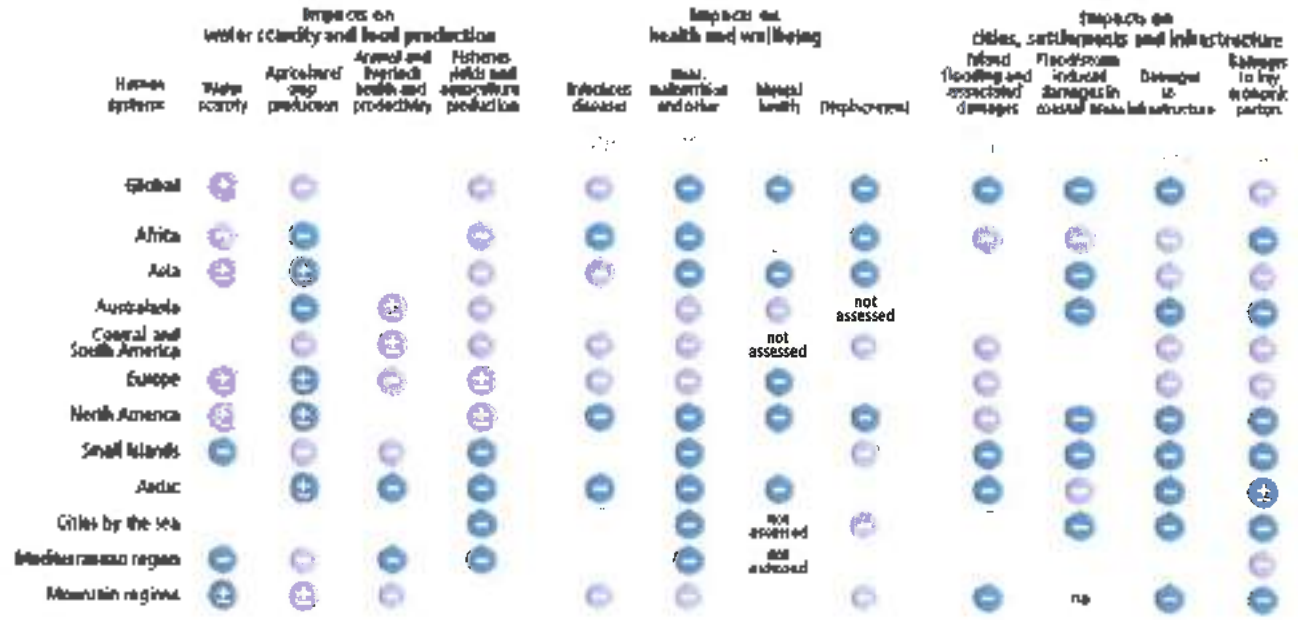


Figure SPM.2 | Observed global and regional impacts on ecosystems and human systems attributed to climate change. Confidence levels reflect uncertainty in attribution of the observed impact to climate change. Global assessments focus on large studies, multi-species, meta-analyses and large reviews. For that reason they can be assessed with higher confidence than regional studies, which may often rely on smaller studies that have more limited data. Regional assessments consider evidence on impacts across an entire region and do not focus on any country in particular.

(a) Climate change has already affected terrestrial, freshwater and ocean ecosystems at global scale, with multiple impacts evident at regional and local scales where there is sufficient literature to make an assessment. Impacts are evident on ecosystem structure, species geographic ranges and timing of seasonal life cycle (phenology) (for methodology and detailed references to chapters and cross-chapter papers see SMTS.1 and SMTS.1.1).

(b) Climate change has already had diverse adverse impacts on human systems, including on water security and food production, health and well-being, and cities, settlements and infrastructure. The + and – symbols indicate the direction of observed impacts, with a – denoting an increasing adverse impact and a + denoting that, within a region or globally, both adverse and positive impacts have been observed (e.g., adverse impacts in one area or food item may occur with positive impacts in another area or food item). Globally, '–' denotes an overall adverse impact. 'Water scarcity' considers, e.g., water availability in general, groundwater, water quality, demand for water, drought in cities. Impacts on food production were assessed by excluding non-climatic drivers of production increases; Global assessments for agricultural production is based on the impacts on global aggregated production; 'Reduced animal and livestock health and productivity' considers, e.g., heat stress, diseases, productivity, mortality; 'Reduced fisheries yields and aquaculture production' includes marine and freshwater fisheries/production; 'Infectious diseases' include, e.g., water-borne and vector-borne diseases; 'Heat, malnutrition and other' considers, e.g., human heat-related mobility and mortality, labour productivity, harm from wildfire, nutritional deficiencies; 'Mental health' includes impacts from extreme weather events, cumulative events, and variances or anticipatory events; 'Displacement' assessments refer to evidence of displacement attributable to climate and weather extremes; 'Inland flooding and associated damages' considers, e.g., river overflow, heavy rain, glacier outbursts, urban flooding; 'Flooding/storm induced damages in coastal areas' include damages due to, e.g., cyclones, sea level rise, storm surges. Damages by key economic sectors are observed impacts related to an attributable mean or extreme climate hazard or directly attributed. Key economic sectors include standard classifications and sectors of importance to regions (for methodology and detailed references in chapters and cross-chapter papers see SMTS.1 and SMTS.1.2).

B.1.4 Climate change has adversely affected physical health of people globally (*very high confidence*) and mental health of people in the assessed regions (*very high confidence*). Climate change impacts on health are mediated through natural and human systems, including economic and social conditions and disruptions (*high confidence*). In all regions extreme heat events have resulted in human mortality and morbidity (*very high confidence*). The occurrence of climate-related food-borne and water-borne diseases has increased (*very high confidence*). The incidence of vector-borne diseases has increased from range expansion and/or increased reproduction of disease vectors (*high confidence*). Animal and human diseases, including zoonoses, are emerging in new areas (*high confidence*). Water and food-borne disease risks have increased regionally from climate-sensitive aquatic pathogens, including *Vibrio* spp. (*high confidence*), and from toxic substances from harmful freshwater cyanobacteria (*medium confidence*). Although diarrheal diseases have decreased globally, higher temperatures, increased rain and flooding have increased the occurrence of diarrheal diseases, including cholera (*very high confidence*) and other gastrointestinal infections (*high confidence*). In assessed regions, some mental health challenges are associated with increasing temperatures (*high confidence*); trauma from weather and climate extreme events (*very high confidence*), and loss of livelihoods and culture (*high confidence*). Increased exposure to wildfire smoke, atmospheric dust, and aeroallergens have been associated with climate-sensitive cardiovascular and respiratory distress (*high confidence*). Health services have been disrupted by extreme events such as floods (*high confidence*). {4.5, 5.12, 7.2, Box 7.3, 8.2, 8.3, Box 8.6, Figure 8.10, 9.10, Figure 9.33, Figure 9.34, 10.4, 11.3, 12.3, 13.7, 14.4, 14.5, Figure 14.8, 15.3, 16.2, CCP5.2, Table CCP5.1, CCP6.2, Figure CCP6.3, Table CCB ILLNESS.1}

B.1.5 In urban settings, observed climate change has caused impacts on human health, livelihoods and key infrastructure (*high confidence*). Multiple climate and non-climate hazards impact cities, settlements and infrastructure and sometimes coincide, magnifying damage (*high confidence*). Hot extremes including heatwaves have intensified in cities (*high confidence*), where they have also aggravated air pollution events (*medium confidence*) and limited functioning of key infrastructure (*high confidence*). Observed impacts are concentrated amongst the economically and socially marginalized urban residents, e.g., in informal settlements (*high confidence*). Infrastructure, including transportation, water, sanitation and energy systems have been compromised by extreme and slow-onset events, with resulting economic losses, disruptions of services and impacts to well-being (*high confidence*). {4.3, 6.2, 7.1, 7.2, 9.9, 10.4, 11.3, 12.3, 13.6, 14.5, 15.3, CCP2.2, CCP4.2, CCP5.2}

B.1.6 Overall adverse economic impacts attributable to climate change, including slow-onset and extreme weather events, have been increasingly identified (*medium confidence*). Some positive economic effects have been identified in regions that have benefited from lower energy demand as well as comparative advantages in agricultural markets and tourism (*high confidence*). Economic damages from climate change have been detected in climate-exposed sectors, with regional effects to agriculture, forestry, fishery, energy, and tourism (*high confidence*), and through outdoor labour productivity (*high confidence*). Some extreme weather events, such as tropical cyclones, have reduced economic growth in the short-term (*high confidence*). Non-climatic factors including some patterns of settlement, and siting of infrastructure have contributed to the exposure of more assets to extreme climate hazards increasing the magnitude of the losses (*high confidence*). Individual livelihoods have been affected through changes in agricultural productivity, impacts on human health and food security, destruction of homes and infrastructure, and loss of property and income, with adverse effects on gender and social equity (*high confidence*). {3.5, 4.2, 5.12, 6.2, 7.2, 8.2, 9.6, 10.4, 13.10, 14.5, Box 14.6, 16.2, Table 16.5, 18.3, CCP6.2, CCB GENDER, CWGB ECONOMICS}

B.1.7 Climate change is contributing to humanitarian crises where climate hazards interact with high vulnerability (*high confidence*). Climate and weather extremes are increasingly driving displacement in all regions (*high confidence*), with Small Island States disproportionately affected (*high confidence*). Flood and drought-related acute food insecurity and malnutrition have increased in Africa (*high confidence*) and Central and South America (*high confidence*). While non-climatic factors are the dominant drivers of existing intrastate violent conflicts, in some assessed regions extreme weather and climate events have had a small, adverse impact on their length, severity or frequency, but the statistical association is weak (*medium confidence*). Through displacement and involuntary migration from extreme weather and climate events, climate change has generated and perpetuated vulnerability (*medium confidence*). {4.2, 4.3, 5.4, 7.2, 9.8, Box 9.9, Box 10.4, 12.3, 12.5, 16.2, CCB DISASTER, CCB MIGRATE}

SPM

Vulnerability and Exposure of Ecosystems and People

B.2 Vulnerability of ecosystems and people to climate change differs substantially among and within regions *(very high confidence)*, driven by patterns of intersecting socioeconomic development, unsustainable ocean and land use, inequity, marginalization, historical and ongoing patterns of inequity such as colonialism, and governance[31] *(high confidence)*. Approximately 3.3 to 3.6 billion people live in contexts that are highly vulnerable to climate change *(high confidence)*. A high proportion of species is vulnerable to climate change *(high confidence)*. Human and ecosystem vulnerability are interdependent *(high confidence)*. Current unsustainable development patterns are increasing exposure of ecosystems and people to climate hazards *(high confidence)*. {2.3, 2.4, 3.5, 4.3, 6.2, 8.2, 9.3, 9.4, 9.7, 10.4, 12.3, 14.5, 15.3, CCP5.2, CCP6.2, CCP7.3, CCP7.4, CCB GENDER}

B.2.1 Since AR5 there is increasing evidence that degradation and destruction of ecosystems by humans increases the vulnerability of people *(high confidence)*. Unsustainable land-use and land cover change, unsustainable use of natural resources, deforestation, loss of biodiversity, pollution, and their interactions, adversely affect the capacities of ecosystems, societies, communities and individuals to adapt to climate change *(high confidence)*. Loss of ecosystems and their services has cascading and long-term impacts on people globally, especially for Indigenous Peoples and local communities who are directly dependent on ecosystems, to meet basic needs *(high confidence)*. {2.3, 2.5, 2.6, 3.5, 3.6, 4.2, 4.3, 4.6, 5.1, 5.4, 5.5, 5.7, 5.8, 7.2, 8.1, 8.2, 8.3, 8.4, 8.5, 9.6, 10.4, 11.3, 12.2, 12.5, 13.8, 14.4, 14.5, 15.3, CCP1.2, CCP1.3, CCP2.2, CCP3, CCP4.3, CCP5.2, CCP6.2, CCP7.2, CCP7.3, CCP7.4, CCB ILLNESS, CCB MOVING PLATE, CCB SLR}

B.2.2 Non-climatic human-induced factors exacerbate current ecosystem vulnerability to climate change *(very high confidence)*. Globally, and even within protected areas, unsustainable use of natural resources, habitat fragmentation, and ecosystem damage by pollutants increase ecosystem vulnerability to climate change *(high confidence)*. Globally, less than 15% of the land, 21% of the freshwater and 8% of the ocean are protected areas. In most protected areas, there is insufficient stewardship to contribute to reducing damage from, or increasing resilience to, climate change *(high confidence)*. {2.4, 2.5, 2.6, 3.4, 3.6, 4.2, 4.3, 5.8, 9.6, 11.3, 12.3, 13.3, 13.4, 14.5, 15.3, CCP1.2, Figure CCP1.15, CCP2.1, CCP2.2, CCP4.2, CCP5.2, CCP6.2, CCP7.2, CCP7.3, CCB NATURAL}

B.2.3 Future vulnerability of ecosystems to climate change will be strongly influenced by the past, present and future development of human society, including from overall unsustainable consumption and production, and increasing demographic pressures, as well as persistent unsustainable use and management of land, ocean, and water *(high confidence)*. Projected climate change, combined with non-climatic drivers, will cause loss and degradation of much of the world's forests *(high confidence)*, coral reefs and low-lying coastal wetlands *(very high confidence)*. While agricultural development contributes to food security, unsustainable agricultural expansion, driven in part by unbalanced diets[32], increases ecosystem and human vulnerability and leads to competition for land and/or water resources *(high confidence)*. {2.2, 2.3, 2.4, 2.6, 3.4, 3.5, 3.6, 4.3, 4.5, 5.8, 5.12, 5.13, 7.2, 12.3, 13.3, 13.4, 13.10, 14.5, CCP1.2, CCP2.2, CCP5.2, CCP6.2, CCP7.2, CCP7.3, CCB HEALTH, CCB NATURAL}
